Fifth Series

ESTABLISHED BY WILLIAM AND ROBERT CHAMBERS, 1832

No. 262.—VOL. VI.

SATURDAY, JANUARY 5, 1889.

PRICE 1½d.

JOHN VALE'S GUARDIAN.

BY DAVID CHRISTIE MURRAY,

AUTHOR OF 'VAL STRANGE,' 'JOSEPH'S COAT,' 'RAINBOW GOLD,' ETC.

CHAPTER I.

Two schoolboys on a summer morning were marching along the road from Beacon-Hargate to Castle-Barfield, in the tranquil heart of mid-England. Each bore a satchel, in which he carried his books, and a provision of cold meat, bread and butter, and hard-boiled eggs, for dinner. They were each furnished also with a broad-mouthed, frayed, old, green baize bag, charged with round pebbles; and as they swung along, they cast searching glances about the road, as if they kept a keen lookout for something. Every now and then one or other would make a dart and a stoop, would take up and examine a pebble, and then would either throw it with rare precision at a mark, or would add it to the contents of the green baize bag.

These two were of the same age to a day, and nearly to an hour, and were cousins by the mother's side. One was swarthy of complexion and a trifle grim in aspect, a boy of the bulldog British pattern; and the other was fair-haired, fresh-coloured, and gray-eyed, with an amiable, dreamy look. They were rising twelve, the pair of them, and were uncommonly well built and well set up for their age.

'Uncus,' said the dreamy boy, 'we shall have a rare old scrimmage with the Mingoos this morning.'

'Wagh!' said the bulldog boy in answer. He was naturally a youth of few words, and the part of 'the sententious savage,' as dear old Cooper used to call the Indian, suited him to perfection.

They were under the dominion of Cooper, and were soaked and saturated with the lore of Beadle's Sixpenny American Library. They had and enjoyed a daily skirmish with a half-score

or so of the natural enemy of Castle-Barfield, and what would have been a mere undignified pecking-match without the glorious help of *Lancy*, grew to an Indian battle by its aid.

There was no seminary for youth in Beacon-Hargate with the sole exception of a dame-school, presided over by an old woman of singularly forbidding aspect and limited learning; and when by her aid, or in spite of her hindrances, the lads had mastered words of two syllables, they were sent off to school to Castle-Barfield, whither they went daily afoot in all weathers, hail, rain, or shine, the whole year round, holiday-times and Sundays alone excepted. On their very first journey, one Sam Saunders, a Barfield boy, by profession a bird-scarer, had experienced a lively and natural resentment at the presence of boys from another parish on a high-road macadamised at the expense of Barfield ratepayers, and had hailed them with derisive epithets. Finding himself repaid in kind, he had fallen back on the argument of arms, and had stoned them from what seemed a safe distance. The youthful strangers, whether by skill or accident, had come victors out of this first fray; and Sam Saunders, afterwards elevated to the rank and dignity of a Mingo chieftain under the title of the Big Bear, fled weeping from the field. It took a week or two to make him understand that the enemy might be expected at a given hour upon the road; but when that fact at last penetrated his mind, he sent round the fiery cross among his tribe and lay in ambush. There was a great fray that morning, and the invaders of the soil were beaten back, and forced to make a detour, which resulted in their being late for school, and bore further fruit in chastisement at the hands of

master who was none too unwilling to inflict it.

Then, in the bosom of William Gregg, the bulldog boy, awoke and flamed the fires of vengeance; and the milder soul of John Vale, the dreamy boy, took heat from his companion's fire, and they twain made a compact to live or die together; and they set up a cock-shy in the orchard of Gregg senior, and practised at the same assiduously in all spare moments, until they grew so accurate in aim and wide in range that the foe had fear of them. They began with a medicine-bottle at fifty boyish paces; but in a while they became so deadly that they could no longer afford so frail a target, and had to substitute an old shoe for the bottle, and this they battered daily and hourly to their hearts' great contentment, filling the exercise, as boys can and do, with a thousand warlike imaginings invisible to the eye of any adult watcher.

When they were on the war-path, they were Uncas' and Pathfinder one to the other; and Uncas carried, as befitted his wild blood, a scalping-knife of lath. The gentler Pathfinder's instincts made him recoil from the use of such a weapon, but he tolerated his friend's possession of it. They got no end of bruises, and enjoyed themselves mightily, developing in this savage warfare all such virtues as war can breed—courage, endurance, resource, magnanimity, and the like, and were really at bottom less mischievously employed than the pessimist in boyhood might imagine.

They drew near that strip of the enemy's country where battle was most commonly offered, and looked to their arms; that is to say, they shook up the green baize bags and arranged the likeliest pebbles topmost. They attached a superstitious value to stones of a certain form; and a disc-shaped pebble of the size of an old-fashioned copper penny and the thickness of three or four was looked on as a precious find and reserved for moments of great emergency.

On the Beacon-Hargate road was what the country-people thereabouts call a Jacob's ladder, a stile with ten or a dozen steps to it, leading from the low-lying lane to fields on a higher level. The pathway to which this ladder led the traveller lay across a series of gently rolling fields which were called Scott's Hills; and in the middle of the fields was a fairy ring, which had so often been danced round by childish feet that the grass was worn altogether away from it and the circle tramped as hard as a board. The hundred acres of open space the fields afforded gave ample opportunity for advance and retreat, and the Mingoes had chosen it for their own country for years past.

The two boys climbed the Jacob's ladder warily and prospected for 'signs'. The eagle eye of Uncas detected a troubled head beyond the line of the first hill. Almost at the same moment the intrepid pair were observed by the enemy, and a wild cry of defiance was raised. Among

the other advantages of the war-country was a clear echo, which returned all noises with a sudden clap of sound like a vocal box on the ear. This redoubled the noise of warfare, and gave a sense of distance, numbers, and vastness inexpressibly delightful. The enemy appearing on the ridge of the hill in an irregular line, opened a harmless fire, to which the allies disclaimed reply. The distance was as yet too great for danger; but the Mingoes, with savage cunning, scattered with intent to form a wide circle and attack the advancing body from every side at once.

'Tis long odds, Uncas,' said the Pathfinder: 'nine to two.'

'Wagh!' said Uncas; and accustomed to every wile the foe might try, they separated, one working to the right and the other to the left, so that they might intercept the intended movement.

The precision of their fire made them dreaded, and the enemy was wary of displaying himself too freely. It was a barbarous form of relaxation, no doubt, but the schoolboys fought for their right of way, and men make war in deadlier earnest in assertion of rights and privileges no whit more sacred, and there is a great deal of human nature in boys.

The fight had varying fortunes, but the expedition forced its way at last; and its way out of the dangerous country seemed assured, when a stroke of treasonous vengeance put an end to the war for good and all, doing such serious execution, that the enemy, scared by its own act, fled into hiding-places and appeared no more. The two schoolboys joined each other at the end of the fray, breathed, flushed, and triumphant, and pursued their road with occasional turns to answer the cries from the defeated. This was all in order and in accord with the best traditions of Cooper and the Sixpenny Library; but the two lads fought honestly and loyally, and at the bottom of their hearts not only had no desire to hurt anybody, but had even a kind of camaraderie for the wild tribe they fought. It was a roughish kind of game, to be sure, but it was no more than a game, after all, and there was no shade of malice in it. But a certain hulking left-handed fellow, a new recruit on the Barfield side, had been hit a day or two before, and imported a murderous seriousness into the fun. He had taken no part in the affair of that day, but lay in wait with a stone the size of his fist until the boys went past him unsuspectingly at a distance of half-a-dozen yards. Then he launched his missile unseen, and dropped back into the ditch from which he had arisen. The stone struck the fair-haired lad above the ear, as he was laughing and sparkling over the combat just finished, and rolled him over as if it had been a musket bullet.

The bulldog boy his comrade, not as yet knowing what hurt had been done, but boiling into sudden rage at treachery, dashed in the direction from which the stone must have been hurled. The traitorous left-handed one rose to flee, but had no chance except to stay and give battle. The fight was brief and decisive, and the traitor being knocked down, refused to get up again. The avenger went back to his comrade, and the youthful coward in the smock-frock crawled through the hedge and ran. His late comrades drew a little nearer in scattered groups and stared

with frightened eyes, for the fair-haired boy lay where he had fallen and made no sign.

'Jack,' said his comrade, kneeling by him, 'are you hurt?' There was no answer. 'Jack! what's the matter? Speak to a fellow! I say, Jack! it isn't like you to sham. Jack! Jack!' He was crying by this time in a voice so wild and frightened, that his hearers stared with guilty and fear-stricken faces upon one another, and scattered, taking as many ways as there were boys. The wild frightened voice pursued them, and then quavered into tears and silence.

The road was unfrequented, and it might be hours before help came that way. John lay so still and silent that for all the other could tell he might be dead. An inexpressible pang of guilt and grief rived the bulldog heart, and the lad fell on the body of his prostrate friend and fawned upon it and kissed it and wept terrible tears. Men hardly know these extremities of grief and terror.

He had knelt for what seemed an age, when a hand was laid upon his shoulder and a voice spoke to him in a tongue he did not understand, and had never even heard before. He looked up with his tear-blurred face and eyes. 'Oh, please help me to carry him home,' he besought the stranger. 'They have killed him! They have killed him!'

The new-comer knelt upon the grass and rolled the unconscious body gently over. There was a little blood upon the cheek, flowing from a slight incision at the top of the right ear, and guided by this he removed the cap and exposed a great bump which showed with a purplish hue through the close-cut silky light hair.

'Oh, la, la!' said the stranger, and felt about the bump with cautious and gentle fingers. The bulldog boy knelt beside him, staring at him with a faint dawn of hope in his heart and giving now and then a gasping sob. The stranger was like no man he had ever seen before. His skin was of a coffee brown, and his beard and hair and eyes were as black as jet and very lustrous. He wore a shabby jacket of claret-coloured velvet, and a gay pink-striped handkerchief tied in a loose and careless knot at his brown throat under the gay blue-striped collar of his shirt. A little billycock hat was stuck on the back of his curly tangled head, and in each ear he wore a gold ring, as fine as hair at top, and thickening at the bottom to the form of a crescent moon. He had no waistcoat, and his shabby trousers were bound about by a leather strap with a big buckle. He looked altogether strange and outlandish; but when he turned his dark eyes on the lad beside him, and his milk-white teeth flashed between his black beard and moustache in a sympathetic grimace of pity, there was something in his look which bred confidence at once.

'Water,' said the stranger, holding out the cap; 'get water.' He spoke the simple words slowly, and with an air of having to search for them in his mind before he found them.

The boy took the cap and ran with it to where a little runnel which had its source in a field drain-pipe bubbled diamond clear. He filled it and ran back with it; but it leaked so fast that for all his haste he arrived with scarcely half a pint. The stranger threw it into the unconscious lad's face, and having fumbled awhile at his

collar, drew a great shining clasp-knife and slit the linen through. 'More,' he said then, and taking off his own hat, offered it. This, being made of a close-beaten felt, came back full, and the foreigner threw it by sharp handfuls into John's face until the gray eyes opened and looked about filimly with no recognition in them, and then closed again.

'His—name?' said the stranger questioningly.

'John Vale.'

'His—home? You—know?' With the same painful slowness and the same air of seeking the words beforehand.

'Yes. There it is. The house with the red roof among the trees, more than a mile away.'

'You spick—too quick,' said the stranger. 'Find—his—home. Come back. Quick.'

William Gregg threw down his bag and satchel and ran as hard as his legs could carry him, though every now and then a sob caught him at the throat and threatened either to choke him or to bring him to a stand-still. Meantime the stranger, walking to the hedge, cut a pair of stout slivers from a hawthorn, and planting one in the turf on either side his unconscious charge's head, took off his coat and suspended it above the boy's face to shade him from the sun, which was by this time growing powerful. When he had done this, he groped gently in the pockets of the coat, and having found tobacco and papers, rolled himself a cigarette, struck a lucifer match upon his trousers, nursed the light in his coffee-brown hands against a faint breeze that was blowing, and so sat puffing, bareheaded in the sun, with his hands about his knees. He was a well-cut, active-looking fellow of about thirty, and very small in stature. He sat like a statue of idleness for half an hour, only moving once or twice to moisten the boy's lips and temples from the water which still lingered in a crease of the felt hat, or to roll and light a new cigarette.

At length there rose a sound of hoofs and wheels, and this coming to a pause in the lane at the foot of the fields, a ponderous man in dusty gray leaved in sight, mounting the Jacob's ladder, and strode solidly towards him. He disappeared once by reason of the rolling formation of the land, but by-and-by showed again near at hand—a grave man, with outstanding eyebrows, honest, simple, steadfast eyes, and a beak like a good-tempered eagle's.

The foreigner rose and confronted him inquiringly. 'His—fazer?' he demanded.

The grave man answering 'Yes,' the stranger drew his coat away from the boy's face and slipped into it with a lounging grace. Then he picked up his hat, waved it twice or thrice to and fro, to shake the water from it, and dropped it anyhow on the top of his black curls, watching the new-comer seriously all the while.

'Poor little chap!' said the father, stooping to raise the boy in his arms. 'It's a mussy knock he's got.—Pick them things up and bring 'em along, will you?'

He spoke with a sidelong gesture of the head; and the foreigner, understanding the sign and the glance which went with it rather than the words, gathered up the satchel, the bag, and the two caps, and obediently followed in the other's ponderous footsteps.

A well-horsed dogcart stood at the bottom of

the ladder, and a man with a straw in his mouth and a general look of stables held the reins. The farmer having carefully descended the steps, held up the boy to him, as if the poor little figure had been no more than a feather's weight. Then he turned upon the foreigner, and holding out one hand for the things he carried, put the other to his pocket with a somewhat doubtful air. He looked with mild inquiry at the shabby jacket and the shabbier trousers and downward to the boots. 'These being dusty, unblacked, and broken, seemed to decide him, and he drew forth a little handful of silver and held it out.'

'Merci!' said the stranger, repelling the offer with both hands. 'No, no, no! Sank you; but no!'

'Take it,' said the farmer, looking again at the broken boots.

The other followed his glance, and smiled with a flash of his white teeth. 'No, no, no!' he said again. 'Sank you, but no! I—have—done;' he paused there and thought for a second or two, and then found 'nossings—nossings.' He paused and thought again, and added, 'Good-luck!' lifting his hat as he spoke.

'Thank you kindly,' answered the farmer. 'There's not a-many of the gypsies as would take the trouble, and fewer as wouldn't take the money. Thank you kindly.'

'No, no!' said the foreigner lightly. 'No sanks. No sing. Good-luck!'

The farmer, climbing into the dogcart, took the boy in his arms, and was driven away, turning a backward glance at the shabby wanderer who would take no money. The shabby wanderer waved his hat to him, and followed the track of the dogcart along the dusty road.

CHAPTER II.

The bulldog boy had been despatched to look for the doctor, and had started upon his search in an agony of self-accusation. He was a boy of the tenderest heart, under his dogged exterior, and as he ran panting and gasping along the road towards the doctor's house—which, by the way, lay a good three miles off—he exaggerated his own share in the feud with the young ragamuffins of Castle-Barfield, and minimised his companion's share in it, until at last he felt as guilty as a murderer. There was a swelling tide of remorse and terror in his heart, and if once he had allowed it to break beyond bounds, he would have had to sit down and cry helplessly and bitterly. So, being one of those determined fellows who will do what they once take to be their duty if they die for it, and seeing that his one present duty was to find the doctor with all possible speed, he choked down his fears and repentances as best he could, and ran as he had never run in his life before, in spite of his choking throat and swelling heart.

As good fortune had it, the doctor very nearly ran over him at a sudden turning of the road. The messenger could scarcely speak, but got his story out in breathless sobs somehow, and so was picked up and driven back to the farmhouse. The farmer and the injured lad had arrived but a minute or two before, and the dogcart was still standing at the gateway. The doctor jumped down, threw the reins to the boy, and entered.

Young Gregg sat in the doctor's trap and held the reins. The sun shone bright, and the trees rustled in the gay wind. Now and then a carter called to his team or cracked his whip, and there was a distant sound of jangling bells. The doctor's horse champed at his bit, and beat the roadway first with one forefoot and then with the other. Muffled voices spoke within the house, and sometimes the wretched listener heard the sound of hurrying feet upon the uncarpeted stairs. He was profoundly troubled, and felt as guilty as Cain, though there was a piteous exculpation of himself going on within doors all the while.

The hostler came and led off the farmer's horse; and the boy, though he longed to ask if the doctor had as yet said anything, was so weighed upon by his fears that he left the question unspoken, and watched the hostler go through the gate and away past the side of the house as miserably as though he knew that the man carried the last shred of hope with him. Then, when he had sat utterly desolate for a quarter of an hour or so, listening to all the sounds in the house with a strained and dreadful fear, he heard the sound of wheels and hoof-beats behind him, and turning his tear-stained face, saw a ponderous, grave, clean-shaven man in the act of pulling up a few yards away. This personage looked a great deal too big for the trap he rode in, and, indeed, had a way with him of looking too big for any place in which he might find himself. He was a man of huge physique, but he had a grave and ponderous way of magnifying himself, as it were, and seeming bigger than he was. He wore gray clothes of a severe and formal cut; his neckcloth was white; and his hat broad, low-crowned, and stiffly curled at the brim, so that he had something of a clerical or semi-clerical air. His gray eyes were keen, and had all their light upon the surface; his mouth, chin, and jaw gave unmistakable signs of an obstinate will. His face was a vulgarised copy of the great Napoleon's, and Mr Robert Snelling himself may be fairly described as a Napoleon minus the brains which made Napoleon remarkable. That is to say, that he saw his neighbour's side of things insect small, whilst his own side looked big as Behemoth; that he had a will of iron, an indomitable selfishness, and an unusual capacity for tyranny.

Robert Snelling was a seed and corn merchant, and a first-cousin of Farmer Vale's. He was immensely respectable, and greatly respected, and he had such a mastiff-way of going straight to any worldly or social bone he wanted, that people generally made a clear road for him. He was a very remarkable person for a rustic tradesman, and had done some reading and thinking in his time. Most people were a little afraid of him, and though he passed as the keenest trader in those parts of the world, he was also held to be a model of rectitude.

He got out of his trap with a solid slow dignity, and tied up the reins to a part of the trap itself with a deliberate action in which no motion seemed wasted or delayed. There was a weight of will in his walk, in his repose, in the way in which he carried his hands, in every heavy gesture.

'Well—ah—Willyum!' says Mr Snelling to the boy. His voice was of a deep drawling bass, and at the end of a phrase, short or long, it closed

on a high loud note delivered with a snap as quick as the sound of a pistol, and not much softer. In conversation, this method of his seemed to indicate at once a deliberate desire for justice and an irrevocable decision. The profound lingering basso meant choice, forethought, wariness. The loud snap at the end of it said, 'There you are! That's settled and done with.'

He saw that the boy was crying, and looked bitterly distressed; but then, boys cried pretty often, and looked bitterly distressed on grounds which, when a man gave himself the trouble of looking at them, were ludicrously small. It was probable, whatever was the matter, that the boy had done something to deserve it; or if he had not, then he would do later. That was the way with boys—to merit suffering, and to suffer.

He marched heavily into the house in that strong and wilful way of his, always as if he expected opposition and were prepared to bear it down, not swaggeringly or bullishly, but with a deep-seated bellicose strength. There was a longish garden, full of intertangled vegetables and flowers, between the gate and the farmhouse, and the pathway between them was brick-paved and smooth and lustrous with many years of constant scrubbing. The beans were in flower like an army of black and white butterflies waiting the signal to rise and flutter in the air, and the roses and wallflower loaded the light wind with odour. Mr Snelling gave a satisfied slow sniff as he went, and stalked into the half-gloom of the clean low-ceilinged kitchen, where pans and crocks caught stray gleams of reflected light, and dazzled in them, and a single big red rose pushed its head in at the open diamonded window.

'Hillo! House here!' cried Mr Snelling, smiting a bare deal table resoundingly with his whip as a signal to the inmates.

'Sh!' answered a voice from above, and a moment later there began a sound of cautious steps upon the stair. These came to an end with the appearance of the farmer, whose face looked pained and anxious. He closed the stair-door gingerly behind him and held out his hand to his cousin. 'Our John's met with a gravish mishap,' he said. 'The doctor's up-stairs with him now.'

'Oho!' said Mr Snelling.—'And how did that come to pass?'

'Not so loud, Robert—not so loud!' cried the farmer. 'That voice of thine sets the beams a-trembling overhead. Some young Rip seems to have thrown a stone at the lad. He's been knocked quite senseless, and he's been moaning on his mother, as has been dead this three years. Dr Haycock looks grave about it. I'm afraid the lad's sore hurt.'

'We'll hope not,' answered Snelling, moderating his voice somewhat, and looking as serious as he thought the case demanded. 'You was always a bit disposed to be tremorful and fearsome, John, and to say die before the time came.—Who was the lad that did it?'

'I've had no time to make proper inquiries yet,' the farmer responded. 'It was Will Gregg brought the news.'

'Ah!' cried Snelling, 'twas him, was it? You'll have to dust his jacket for him.'

The drawl and the snap together gave this almost an air of justice; but the farmer inter-

posed: 'I said 'twas young Gregg brought the news.'

'Yes, yes,' replied Snelling in his weighty way. 'We'll sift this.' He marched out of the kitchen into the sunlight, whip in hand, and sought the stables. There he found the hostler, who by this time had got the horse out of harness, and was missing round him like a whole brood of snakes as he thumped and polished him with a plaited hay wisp. 'James,' said Mr Snelling in a magisterial manner, 'there's a young youth, outside guarding the doctor's hoss. Send him in to me, and keep an eye on the trap yourself. That chestnut's a bit skittish.'

James, to whom any moment of leisure was tedious without tobacco, paused to take a short black pipe from his waistcoat pocket and to strike a match upon his corduroy trousers. Mr Snelling, having given his orders, had immediately retired. He returned to the kitchen, and there, planting an armchair in the middle of the floor, sat down in it and waited to deal out justice.

'Well—ah—Willyum,' he began, as the boy entered, 'how came you to do this damage to Mr Vale's little boy?'

'It wasn't me, Mr Snelling,' returned William. 'We'll see about that by-and-by,' said Mr Snelling, sternly ponderous and wise, a spectacle to strike a guilty boy with awe. A spectacle, perhaps, to strike an innocent boy with a sense of exasperation.

'Let the lad tell how it happened, Robert,' said the farmer.

Mr Snelling gave a wordless wave of his right arm, as if to say, 'Leave an open road for Justice and for Wisdom, and leave this boy to me.'

'How came you, sir, to do this act of wicked damage?' he asked.

'Mr Vale,' said the boy, turning to the farmer, 'I'll tell you all about how it happened.'

'And no lies, mind,' interrupted Mr Snelling. 'A lie's always found out, and it'll make it a great deal worse for you.—So now, go on.'

The bulldog boy looked at him rebelliously. Perhaps he may have thought on what altered lines he would conduct the conversation if he were as big as Snelling.

'Ever since we've gone to school to Barfield,' he began again, addressing himself naturally to Vale, and got to the brow-beating injustice in the armchair, 'we've always had a fight in the morning with some of the Barfield boys on Scott's Hills. We couldn't pass without, and so we've always had a fight with 'em.'

'What do you mean,' Snelling demanded, 'by saying?'

'There was a new boy there last Thursday'—the lad went on; but Snelling stopped him with a sonorous 'Wait there.'

The boy waited, regarding him with a rebellious eye and a lowering face. He had begun to glow with his story, and would have made it all clear in a moment, and he had been full of honest and tender self-accusation.

'You're talking to your elders, you are,' said Snelling. 'You're not talking to a parcel of children as are ready to believe anything. What do you mean by saying that you couldn't pass to Barfield without having a fight in the morning?'

'We might have passed,' the boy answered, 'if we had taken the cowardly blow and gone round'

by the church. But that's a mile out of the way, and we didn't mean to take the cowardly blow.'

'You mean,' said Mr Snelling, 'as you provoked the fight?'

'We didn't provoke the fight,' cried the boy in hot resentment.

'How dare you take that tone with your elders, sir?' asked Snelling. 'Is that the way your father brings you up?'

'Come, come, Robert,' said the mild farmer; 'have a bit of patience with the lad.—Tell your tale, William; and then if there's any questions to be asked, me and Mr Snelling'll put 'em afterwards.'

'John,' returned Mr Snelling, with almost as solemn an air of superior age and size as he employed to the boy himself, 'you're wanting in firmness. Lence him to me. I'll get the truth out of him, never fear.' He laid his hands upon his knees and leaned a little forward, as if he were just beginning to take trouble in the matter. —'Now, William (Gregg), go on, and let us have no more prevarication.'

But William Gregg was not disposed to go on, having been brow-beaten beyond the necessary, according to his way of thinking. All the self-accusation and all the tender remorseful feeling had gone out of him, and in his own fashion he could be as obstinate as Snelling himself. There is no saying what might have come of the conflict, for just when the boy's silence was growing noticeable, the doctor came down-stairs, and caused a diversion.

'I hope the lad's come by no real mischief, doctor?' said Snelling, turning upon him.

The doctor was a pale man with puffy eyelids, and looked as if he spent his nights in tears. It was no part of his professional scheme to lessen the importance of his own services by making too light of a case, and he shook his head with so mournful and despondent an air that the farmer took fright at him.

'Come, come, Dr Huxcock,' said Vale; 'it is to be hoped it isn't as bad as that comes to?'

The doctor did not say how bad it was, but he shook his head again and looked deeply serious. At this young Gregg was seized with new terrors, to which he hardly dared to give a name.

Snelling rose from his seat, and laying his two great hands on the topmost rail of the chair, bent above the doctor. 'Mr Vale,' he said, in his deliberate deep voice, with its note of swift decision here and there, 'is not a man as needs be trifled with, nor a man as fears to know the truth. You can tell us what to look for, doctor, and we are men as can endure it.'

'It's no part of my business,' answered the doctor, 'to cast down your spirits; and it is too early, gentlemen, to pronounce a decided opinion. But I am free to tell you that I don't like the look of things. We shall know more in a little while. I will drive over this evening.'

'You'll take a glass of ale afore you go, doctor?' asked Vale. He asked less out of his home-bred country hospitality than because he seemed to cling to the doctor in his own mind, and would fain have delayed him if he could, all day.

'Well,' said the doctor lingeringly—'yes; I will take a glass of ale.' He was as mournful over that as he was over the boy's condition, and he drank the ale when it came with a griev-

ing relish, as rustic mourners take their port or sherry at a funeral. 'I will drive over again this evening,' he said as he shook hands.

William Gregg had slipped away, and when Snelling looked round for him to renew his bullying catechism, the boy was not to be seen. He was very strong and undemonstrative by nature; but he had been already frightened into a storm of grief that morning, and the doctor's words and manner struck him with a new terror, so that he could not control his tears. He would rather any day have taken a flogging than have been caught crying, and so he stole away and hid himself in a barn, and there had his second burst of grief and fear all to himself.

Grief and fear were not all that filled his mind, for a bitter sense of injustice mingled with them. He knew he would have fought until he could fight no longer to save his chum from harm, and his heart so revolted at the cowardice and treachery which had done this mischief, that to find the mischief charged upon himself was a double wrong, and altogether insupportable. He hated Snelling with as much passion as his grief left room for; but he was helpless under the injustice put upon him.

There are some men, but not many, who take the trouble to realise for themselves what children think and feel. Mr Robert Snelling was certainly not one of them, and he would have cared very little, even if he had known of the tempest he had raised. If a creature as big as the side of a house had domineered over him, had jeered him, brow-beaten him, charged him without an atom of evidence with crimes impossible to his nature, and left him without the possibility of redress or vengeance, it would have been a different thing altogether. But a boy? What does it matter what you say to a boy? What does it matter what a boy thinks, or what he fancies himself to suffer? Things would have come to a pretty pass, surely, in his estimation, if a man of middle age might not say what he pleased to a boy.

Young Gregg had sobbed and fought himself into quiet, when the farmer, wandering uneasily hither and thither, strolled into the barn and found him. The lad stood up sullenly, prepared for fresh injustice, and steeling his heart against it. But the farmer, laying a kindly hand on his shoulder, simply asked him: 'Tell us how it happened, William.'

So William told the whole story straightforwardly and simply; and the farmer, ordering the mare to be harnessed anew, drove off with him to discover and identify the guilty author of the damage.

'You oughtn't to have had any truck with them rough lads, William,' he said, as they drove away.

'We couldn't help it, sir,' said William. 'They wouldn't let us go by without a fight.'

The farmer sighed; but he remembered his own boyhood. He was a very mild man indeed, and he had been mild as a boy; but he knew that he would have fought for his right of way, if it had been disputed.

'The proper way would have been for you to ha' told your father, and for John to ha' told me,' he answered. 'We should ha' put an end to it directly.—But now, you see what comes

of fighting and taking your own cause if your own hands afore you're old enough to be wise, my lad.'

The extreme gentleness of this rebuke broke William Gregg anew, and he sobbed all the rest of the way.

TERM BEGINS AGAIN.

THE month of holiday, so eagerly longed for, has come and gone; the fellows return to-day. Newspapers and circulars have informed the world that 'the above College will resume its duties on January 21st;' or some more briefly make it known thus: 'The Spring Term commences Jan. 21st.' In fact, in these days of hurry, the latter style receives more general favour, and but few find time to add D.V., to catch the eye and heart of parents of a pious turn of mind.

This morning the College governor and chaplain came smiling into breakfast. 'Well, the vacation is over, and the day is fine for travelling.' His good lady, pouring out the steaming coffee, hopes the boys will take care of themselves, and not start the term with bad colds and require nursing directly they get back.

At the lodge gates, the same programme was gone through an hour since: the porter and 'general factotum' informs his 'missus' that 'the vacation is over,' and not very pleasantly either, as it means the unloading and hauling about of scores of boxes heavy with books, jam-pots, boots, skates, and other weighty material. The kitchen-maid informs the milkman that 'the boys is comin' in to-day, and cook says he must bring ten gallons to morrow morning.' The butcher and baker receive similar announcements and enlarged orders; they in their turn fail not to tell their numerous acquaintances at the back-doors in every street in the town that 'the College young gentlemen come back to-day.'

However the world puts this important matter, the result is the same: by eleven o'clock to-night, two hundred and fifty beds that were empty last night will hold a tenant. There stand the beds in the moonlight—two long rows in No. 4, each bed with a dark knob at the head, and a figure extended therefrom or coiled up by the pillow. By this time every boy has dropped off to sleep; the loud breathing and occasional cough are the only sounds to be heard, except when that new boy in the corner turns over in his dream. Poor boy: he had a small 'weep' before he fell asleep. Last night he was in the little room at home, his box was packed and lying at the foot of the bed, but to-night his bed is empty and the box gone. The mother cannot pass his room to-night without going in to convince herself that he is not there. His bed is painfully empty. Sadly she passes out and closes the door behind her, not without a prayer and a tear. This small tragedy is being acted all over the country; untenanted beds strew the land, and fond mothers weep over them.

But we have brought the fellows back to College in somewhat of a hurry; we need hardly say that boys do not usually fly from the small bedroom at home to the big dormitory at College. A melancholy breakfast is followed by sad farewells; railway tickets, labels, porters, and cabmen

to be negotiated, and a dozen other matters must be attended to before nightfall.

In the matter of going home, boys are universally agreed that the earliest trains are infinitely the best. Although two hours of wearisome travelling might be spared by choosing a late fast train, he is no ordinary schoolboy who can calmly sit down and wait while his chums are starting at 6.45 A.M. In the matter of returning, on the contrary, there is considerable diversity of opinion.

The first arrival makes his appearance soon after breakfast. If he isn't a new boy—for new boys usually are in a hurry to see what College is like—it is easy to fix him down to be one of a certain half-dozen. There is a type of boy that always returns at this early period of the morning, either because he is very sick of home and holidays, or because he wishes to secure the most comfortable bed in No. 6 bedroom, and the best of everything else that others might particularly like to have. He is by no means a desirable character. When his early raids have terminated, his time is spent very enjoyably in quizzing the new boys as they arrive, and laughing boisterously at anything that doesn't suit his limited notions of propriety. He never fails to inquire after the grub-box, to ask the names of the new-comer's sisters and the amount of pocket-money he has brought.

There is another type of boy that invariably comes back several days late: nothing would induce him to come up to time. He is a jolly, careless, and foolish fellow, caring nothing for position in class or loss of time and knowledge. The fellows say that he tells his parents the wrong date in order to escape the examination in holiday-work which takes place on the first day; but it is more probable that the parents are as indifferent as the sons, and keep them at home merely because they wish it. Such parents become rarer year by year; not only do they send their sons on the right day, but even grumble because the holidays are so long.

The traffic on the College drive is greatest between three o'clock and seven. There they come. A huge bus-load slowly winds its way from the big gates up the grounds to the front of the building, its top covered with figures moving about under mortar boards. It is just a month since they passed through the same gateway shouting and hurrahing, rousing the neighbourhood with *Dulce Domum* and *Auld Lang Syne*. The return is not so jubilant and noisy; yet there is plenty of excitement, and seemingly nothing of that melancholy which is supposed to seize upon the British schoolboy and play such havoc with him in the shape of homesickness. Anything that affects the feelings of a representative schoolboy ought to be hailed with delight; he is not over-tender; at least we mustn't expect to find any symptoms of it on the top of a bus. Possibly he gave way to it for a short while when he first started this morning. Having waved his hand to the figures on the platform until a signal-box intercepted the view, he sat down in a corner of the carriage quite still, and gazed into space as well as he could through a big bead which would insist on filling each eye. How long he would have remained in this thoughtful attitude it is useless to attempt to decide.

perhaps it is as well that Brooks and his brother interrupted the solemnity of the occasion by entering the carriage at the next station and shaking him vigorously by the hand, more commonly styled the paw or the slipper. The schoolboys' train is often like the river—it gathers volume at different junctions as it proceeds, and finally discharges its contents on the desired platform.

The well-known faces turn up one after the other, and no time is left for melancholy reflection. Matters of vital importance have to be discussed. Robinson isn't coming back, so that there will be another vacancy in the Football Fifteen. How many new masters are there? Is Dumps returning, or did the Doctor give him the sack? When there is an idle moment left, there is opportunity for a private cogitation on an all-important question—the pocket-money. Even when one is old enough to have forgotten that he ever wore knickerbockers, five shillings extra will cover any amount of doleful feelings. It had been a matter of speculation all the holidays as to 'how much the Pater would tip up,' so that to have one's highest anticipations beaten by five shillings left no room for other than feelings of congratulation. In fact, the homesick boy has become a *rara avis*. But when you do catch him shedding a quiet tear in a corner of the playground, he is an affectionate, sympathetic, little fellow of the right sort, lamenting the absence of something more lasting and satisfying than cake and jam.

The ordinary schoolboy, who gets infinite enjoyment out of kicking inflated leather about, and in the very 'feel' of a bat, has more real enjoyment at College than at home, because he always has at hand the necessary paraphernalia and companions, without having to hunt all over the town to raise a side; also, the restraints of home-life, which are often more irksome than those of school-life, are removed. Notwithstanding this, it is hardly necessary to say that holidays will always be appreciated, because they are a change from the routine of the Term. In the same way, many of us who are older and prefer the quiet of home-life, start off in July with light hearts for six weeks' more or less wearisome travelling, and often wish ourselves back again.

School can no longer be called a jail; the hours of confinement are made just long enough to cause the playtime to be appreciated; in fact, there is a feeling prevalent that school is made far too easy a matter for the better classes. 'A liberal diet' is also an actuality, and finds its place on every prospectus along with 'no corporal punishment.' Certainly, this is not prison life and fare.

Here comes the last load up the drive. No prison van this. Now they stop. Down the fellows tumble on to the College steps, and are lost to sight in the open doorway under the clock-tower, chatting and laughing all the time. In they go! The Rubicon is crossed, and Term has begun once more.

That open doorway, that hole under the clock at the foot of the tower, has a sort of fascination about it; it reminds one of the hole in front of a beehive where the bees pass in and out; or in some vague way of the hole in the hillside into which the 'Pied Piper' led the children of Hamelin. But first and foremost it brings before our eyes one's own particular portal, through

which we were wont to pass and repass during those years at College. Do we not still remember how, when standing in its shadow for the first time, we nearly broke our young neck in staring up the face of the tower as Father pulled the big bell-handle at its base to gain admittance. What a height it appeared—hundreds of feet! From that time it gradually got smaller and smaller as our youthful vision expanded, until we found out it was only ninety feet, and that the hands of the clock were not a quarter of a mile, as we at first supposed.

We had equally magnified notions of the learning of this august building, that were by no means lessened when we tried to decipher the Latin motto cut in the stone above the entrance. But we were admitted in spite of our fears and the grim monsters that glared down on us with stony eyes from every convenient corner of this Gothic pile. We cannot say that we wish for a return of those days; in the main we are well contented with our present lot. But it is possible that on one day in the three hundred and sixty-five, when we are dropping in for more kicks than halfpence, we might wish to stand once more in the College entrance-hall in big collar and knickers with two boxes containing all the necessary property of life—a clothes-box and a grub-box; blest also with an innocent mind and a strong digestion; in short, able to sit on one's boxes and have the satisfaction of knowing that under one's hat are all things necessary to command success and happiness for the next three months at least.

JEREMY YORK.

A STORY OF OLD DEAL.*

By W. CLARK RUSSELL,

Author of the *Wreck of the Grosvenor*, etc.

I.

A LIGHT westerly wind had crowded the spacious waters of the Downs with anchored vessels. The colour, the apparel, the quaint bravery of the ships and mariners of the last century, made a noble and sparkling show of the marine pageant. The hour was a little before sundown, and the gush of warm red glory past the giant headland went in a tincture of dark gold to the zenith, and thence pale as amber to the eastern sea-line, with a hot crimson head of cloud here and there vaguely defined upon the delicate radiance, whilst the horizon ran with a line as clear as though scored with the sweep of the leg of a pair of compasses.

It was an evening in the month of September. There were scarce fewer than three hundred sail of vessels gently straining at their hemp cables to the easterly set of the water. They had come together as if by magic, for that morning the historic tract of waters had steeped bare to the white terraces of the Forelands; whilst now the

* The tradition upon which the following narrative is founded, although above a hundred and thirty years old, is still current in the South Foreland district. It is briefly referred to in several of the local guide-books and histories.

multitudinous shipping showed like a forest upon the sea, gay with fluttering pennons, delicate as a bit of pencilling with the wondrous intricacies of the rigging, brilliant with the red sheen of the waning luminary upon glass and brass; upon the writhing of gilt-work upon quarter-galleries and castellated sterns; upon innumerable figure-heads of fantastic device; upon yellow spars where the expiring flames in the west trembled in veins of burnished brass.

An old-world scene of this kind is not to be matched nowadays. The iron craft has entered the soul of the marine, and all is dull, flat, prosaic. Ships of fifty fashions filled the Downs that evening. There was the towering three-decker, grand as a palace afloat, with handsome galleries and spacious windows trembling to the lustre that rose to them from off the running water, the red coats of marines dotting the white lines that crowned her adamantine defences, shrouds as thick as cables soaring to huge round tops, from which, higher and higher yet, rose topmast and topgallant-mast and royal-mast into miracles of airy delicacy, from whose central spire languidly floated the pennon of the ship of the state. There was the East Indiaman outward bound, newly brought up, scarcely less regal in her way than the first-rate, with John Company's house-flag at the main under the dog-vane that glanced like a streak of fire to the raining of the splendour beyond the line of coast, the red flag at her peak, the grinning lips of cannon along her sides, the glitter of uniforms upon her quarter-deck, and rows of lively hearties aloft upon her topsail yards snuggling the spaces of white cloths into lines of snow. There were the little bilander bound to the Mediterranean, rigged with a long lateen yard upon her mainmast; the high-sterned pink; the round-bowed sturdy snow; the galley of a hundred and fifty tons, whose long low hull, with ports for sweeps, gave her a most piratical look, with a malignant fancy to follow on of a breathless calm and a stagnated vessel, towards which this same galley is impelled by her huge oars, as though she were some vast deadly marine insect subtly though swiftly stirring to the impulse of its antennæ.

The scene was full of light and life. Standing on Deal beach, so quiet was everything ashore, so still this hour of sundown, you would have heard a blending of innumerable sounds softened into music by distance—the strains of fiddles in the nearer craft, the voices of men singing, the pleasant noise of bells, the clank and rattle of winches and capstans and windlasses, the chorusing of lungs of leather stowing the canvas, the shrill chirpings of boatswains' whistles. Then on a sudden broke the sudden harsh thunder of a gun from the line-of-battle ship. It was instantly followed by the graceful drooping of the many-coloured bunting to right and left, denoting the hour of sunset; and now masthead and gaff-end showed bare of the bunting that had but a little before made the mass of shipping appear like a floating city of banners; and high above the congregation of masts the towering fabric of the three-decker loomed grim and forbidding upon the darkness of the evening stealthily creeping like some dark curl of breeze out of the east.

II.

Whilst the sullen explosion of the gun was echoing along the Sandwich plains, a large, exceedingly handsome brig, that had been quietly pushing her way into the heart of the shipping, helped rather by the tide than by the faint fannings aloft, hauled up her courses and let go all halliards; and a minute after, her anchor fell from the cathead and she swung quietly to the drag of her cable. She was from down Channel, a homeward-bounder; but those were the ambling days of trade; no fuss was made over what we now call prompt despatch. It was merely a question of how the wind sat; and a six weeks' detention in the Downs was accepted as a common-place incident in a voyage from the Thames to foreign parts.

A few minutes after the brig's anchor had been let go, a signal was made to the shore for a boat. The twilight was yet abroad; the line of the land dark against the rusty crimson of the west; the flag was to be readily descried, and there was a fluttering of air still to make a conspicuous thing of the bunting amid the congregation of colourless spars and masts, amid which, here and there, you already saw the twinkling of a cabin-lamp or of a lantern swinging pendulum-like from the fore-stay.

A tall young fellow of some three or four and twenty years of age stood in the gangway of the brig, impatiently gazing shorewards. He was distinctly handsome, spite of a certain haggardness and hollowness that seemed to betoken a considerable spell of illness. His eyes were large, dark, and lustrous, full of intelligence, and, as one should say, of softness also. He stood a little above six feet, but with the stoop of a man who had not yet been able to stiffen himself out of a long term of prostrating sickness. His hair was long and abundant and curled plentifully upon his shoulders and back: an oddity in him, to engage at least a shrewd-going eye, accustomed to the perukes and bags and 'tyes' of the streets. He was habited plainly in a coat with vast cuffs and pockets and metal buttons, crimson breeches, coarse gray stockings, and shovel-shaped shoes heavy with large plate buckles. His hat was a three-cornered affair, and from time to time he fanned his face with it, whilst he continued to watch steadfastly and anxiously the approach of a boat from Deal beach.

'Here comes something that looks like a punt, at last, Mr York,' exclaimed the skipper of the brig, approaching him—a broad-beamed, bullet-headed bit of a man, standing on oval shanks and carrying a face as red as the flag he sailed under. 'Hope you'll pick up ashore, I do. Remember my words—if you feel able to ship along with me by the time I am ready to sail, and that's giving you from now to December, why, all that I can say is, there's a berth ready for you.'

'I am heartily obliged to you, sir, for the offer,' said the other; 'and I thank you from the depths of my soul for the kindness you've done me.—Indeed, Captain Settle, I shall never forget you; and if I am equal to going a-sailing again by December, you may reckon me already, sir, as upon the ship's articles.'

They continued exchanging compliments after this pattern whilst the boat approached; presently

perhaps it is as well that Brooks and his brother interrupted the solemnity of the occasion by entering the carriage at the next station and shaking him vigorously by the hand, more commonly styled the paw or the flipper. The schoolboys' train is often like the river—it gathers volume at different junctions as it proceeds, and finally discharges its contents on the desired platform.

The well-known faces turn up one after the other, and no time is left for melancholy reflection. Matters of vital importance have to be discussed. Robinson isn't coming back, so that there will be another vacancy in the Football Fifteen. How many new masters are there? Is Dumps returning, or did the Doctor give him the sack? When there is an idle moment left, there is opportunity for a private cogitation on an all-important question—the pocket-money. Even when one is old enough to have forgotten that he ever wore knickerbockers, five shillings extra will cover any amount of doleful feelings. It had been a matter of speculation all the holidays as to 'how much the Pater would tip up,' so that to have one's highest anticipations beaten by five shillings left no room for other than feelings of congratulation. In fact, the homesick boy has become a *rara avis*. But when you do catch him shedding a quiet tear in a corner of the playground, he is an affectionate, sympathetic, little fellow of the right sort, lamenting the absence of something more lasting and satisfying than cake and jam.

The ordinary schoolboy, who gets infinite enjoyment out of kicking inflated leather about, and in the very 'feel' of a bat, has more real enjoyment at College than at home, because he always has at hand the necessary paraphernalia and companions, without having to hunt all over the town to raise a side; also, the restraints of home-life, which are often more irksome than those of school-life, are removed. Notwithstanding this, it is hardly necessary to say that holidays will always be appreciated, because they are a change from the routine of the Term. In the same way, many of us who are older and prefer the quiet of home-life, start off in July with light hearts for six weeks' more or less wearisome travelling, and often wish ourselves back again.

School can no longer be called a jail; the hours of confinement are made just long enough to cause the playtime to be appreciated; in fact, there is a feeling prevalent that school is made far too easy a matter for the better classes. 'A liberal diet' is also an actuality, and finds its place on every prospectus along with 'no corporal punishment.' Certainly, this is not prison life and fare.

Here comes the last loud up the drive. No prison van this. Now they stop. Down the fellows tumble on to the College steps, and are lost to sight in the open doorway under the clock-tower, chatting and laughing all the time. In they go! The Rubicon is crossed, and Term has begun once more.

That open doorway, that hole under the clock at the foot of the tower, has a sort of fascination about it; it reminds one of the hole in front of a beehive where the bees pass in and out; or in some vague way of the hole in the hillside into which the 'Pied Piper' led the children of Hamelin. But first and foremost it brings before our eyes one's own particular portal, through

which we were wont to pass and repass during those years at College. Do we not still remember how, when standing in its shadow for the first time, we nearly broke our young neck in staring up the face of the tower as Father pulled the big bell-handle at its base to gain admittance. What a height it appeared—hundreds of feet! From that time it gradually got smaller and smaller as our youthful vision expanded, until we found out it was only ninety feet, and that the hands of the clock were not a quarter of a mile, as we at first supposed.

We had equally magnified notions of the learning of this august building, that were by no means lessened when we tried to decipher the Latin motto cut in the stone above the entrance. But we were admitted in spite of our fears and the grim monsters that glared down on us with stony eyes from every convenient corner of this Gothic pile. We cannot say that we wish for a return of those days; in the main we are well contented with our present lot. But it is possible that on one day in the three hundred and sixty-five, when we are dropping in for more kicks than halfpence, we might wish to stand once more in the College entrance-hall in big collar and knickers with two boxes containing all the necessary property of life—a clothes-box and a grub-box; blest also with an innocent mind and a strong digestion; in short, able to sit on one's boxes and have the satisfaction of knowing that under one's hat are all things necessary to command success and happiness for the next three months at least.

JEREMY YORK.

A STORY OF OLD DEAL.*

By W. CLARK RUSSELL,

Author of the *Wreck of the Grosvenor*, etc.

I.

A LIGHT westerly wind had crowded the spacious waters of the Downs with anchored vessels. The colour, the apparel, the quaint bravery of the ships and mariners of the last century, made a noble and sparkling show of the marine pageant. The hour was a little before sundown, and the gush of warm red glory past the giant headland went in a tincture of dark gold to the zenith, and thence pale as amber to the eastern sea-line, with a hot crimson head of cloud here and there vaguely defined upon the delicate radiance, whilst the horizon ran with a line as clear as though scored with the sweep of the leg of a pair of compasses.

It was an evening in the month of September. There were scarce fewer than three hundred sail of vessels gently straining at their hemp cables to the easterly set of the water. They had come together as if by magic, for that morning the historic tract of waters had steeped bare to the white terraces of the Forelands; whilst now the

* The tradition upon which the following narrative is founded, although above a hundred and thirty years old, is still current in the South Foreland district. It is briefly referred to in several of the local guide-books and histories.

multitudinous shipping showed like a forest upon the sea, gay with fluttering pennons, delicate as a bit of pencilling with the wondrous intricacies of the rigging, brilliant with the red sheen of the waning luminary upon glass and brass; upon the writhing of gilt-work upon quarter-galleries and castellated sterns; upon innumerable figure-heads of fantastic device; upon yellow spars where the expiring flames in the west trembled in veins of burnished brass.

An old-world scene of this kind is not to be matched nowadays. The iron craft has entered the soul of the marine, and all is dull, flat, prosaic. Ships of fifty fashions filled the Downs that evening. There was the towering three-decker, grand as a palace abaft, with handsome galleries and spacious windows trembling to the lustre that rose to them from off the running water, the red coats of marines dotting the white lines that crowned her adamantine defences, shrouds as thick as cables soaring to huge round tops, from which, higher and higher yet, rose topmast and topgallant-mast and royal-mast into miracles of airy delicacy, from whose central spire languidly floated the pennon of the ship of the state. There was the East Indianman onward bound, newly brought up, scarcely less regal in her way than the first-rate, with John Company's house-flag at the main under the dog-vane that glanced like a streak of fire to the raining of the splendour beyond the line of coast, the red flag at her peak, the grinning lips of cannon along her sides, the glitter of uniforms upon her quarter-deck, and rows of lively hearties aloft upon her topsail yards snugging the spaces of white cloths into lines of snow. There were the little bilander bound to the Mediterranean, rigged with a long lateen yard upon her mainmast; the high-sterned pink; the round-bowed sturdy snow; the galley of a hundred and fifty tons, whose long low hull, with ports for sweeps, gave her a most piratical look, with a malignant fancy to follow on of a breathless calm and a stagnated vessel, towards which this same galley is impelled by her huge oars, as though she were some vast deadly marine insect subtly though swiftly stirring to the impulse of its antennæ.

The scene was full of light and life. Standing on Deal beach, so quiet was everything ashore, so still this hour of sundown, you would have heard a blending of innumerable sounds softened into music by distance—the strains of fiddles in the nearer craft, the voices of men singing, the pleasant noise of bells, the clank and rattle of winches and capstans and windlasses, the chorusing of lungs of leather stowing the canvas, the shrill chirpings of boatswains' whistles. Then on a sudden broke the sudden harsh thunder of a gun from the line-of-battle ship. It was instantly followed by the graceful drooping of the many-coloured bunting to right and left, denoting the hour of sunset; and now masthead and gaff-end showed bare of the bunting that had but a little before made the mass of shipping appear like a floating city of banners; and high above the congregation of masts the towering fabric of the three-decker loomed grim and forbidding upon the darkness of the evening stealthily creeping like some dark curl of breeze out of the east.

II.

Whilst the sullen explosion of the gun was echoing along the Sandwich plains, a large, exceedingly handsome brig, that had been quietly pushing her way into the heart of the shipping, helped rather by the tide than by the faint fannings aloft, hauled up her courses and let go all halliards; and a minute after, her anchor fell from the cathead and she swung quietly to the drag of her cable. She was from down Channel, a homeward-bounder; but those were the ambling days of trade; no fuss was made over what we now call prompt despatch. It was merely a question of how the wind sat; and a six weeks' detention in the Downs was accepted as a commonplace incident in a voyage from the Thames to foreign parts.

A few minutes after the brig's anchor had been let go, a signal was made to the shore for a boat. The twilight was yet abroad; the line of the land dark against the rusty crimson of the west; the flag was to be readily descried, and there was a fluttering of air still to make a conspicuous thing of the bunting amid the congregation of colourless spars and masts, amid which, here and there, you already saw the twinkling of a cabin-lamp or of a lantern swinging pendulum-like from the fore-stay.

A tall young fellow of some three or four and twenty years of age stood in the gangway of the brig, impatiently gazing shorewards. He was distinctly handsome, spite of a certain haggardness and hollowness that seemed to betoken a considerable spell of illness. His eyes were large, dark, and lustrous, full of intelligence, and, as one should say, of softness also. He stood a little above six feet, but with the stoop of a man who had not yet been able to stiffen himself out of a long term of prostration sickness. His hair was long and abundant and curled plentifully upon his shoulders and back: an oddity in him, to engage at least a shore-going eye, accustomed to the perukes and bags and 'tyes' of the streets. He was habited plainly in a coat with vast cuffs and pockets and metal buttons, crimson breeches, coarse gray stockings, and shovel-shaped shoes heavy with large plate buckles. His hat was a three-cornered affair, and from time to time he fanned his face with it, whilst he continued to watch steadfastly and anxiously the approach of a boat from Deal beach.

'Here comes something that looks like a punt, at last, Mr York,' exclaimed the skipper of the brig, approaching him—a broad-beamed, bullet-headed bit of a man, standing on oval shanks and carrying a face as red as the flag he sailed under. 'Hope you'll pick up ashore, I do. Remember my words—if you feel able to ship along with me by the time I am ready to sail, and that's giving you from now to December, why, all that I can say is, there's a berth ready for you.'

'I am heartily obliged to you, sir, for the offer,' said the other; 'and I thank you from the depths of my soul for the kindness you've done me.—Indeed, Captain Settle, I shall never forget you; and if I am equal to going a-sailing again by December, you may reckon me already, sir, as upon the ship's articles.'

They continued exchanging compliments after this pattern whilst the boat approached; presently,

it was alongside, and the tall young fellow whom the captain had addressed as Mr York prepared to descend.

'I shall endeavour to be in London the week after next,' he exclaimed as he swung a moment by the man-ropes; 'and I trust, captain, you'll not forget to put in a good word for me with the owners of the *Colia*. It will be a matter of twenty-eight pounds to me, who am now in a condition to view even a sixpence as a very serious thing.'

'Trust me, trust me, Mr York,' the captain exclaimed with a cheery wave of his hand.

The tall young fellow, named Jeremy York, lowered himself into the boat; a small bundle—apparently all the luggage he had—was handed down to him by the skipper; he flourished his hat; the crew of the brig, some of whom were at work upon the fore-castle and some aloft, gave him a cheer; and in a moment or two he was being swept shorewards by the vigorous arms of a brace of Deal boatmen.

It was now dark; the western hectic was gone, the stars floated in a showering of brilliant points to the liquid dusk, that hung glimmerless above the horizon, with here and there a round-browed cloud with a sheen upon it like the head of a snow-cloud rise to obscure a narrow space of the sparkling dome. The Foreland soured wan and massive from the white wash of the water at its base, then swept darkly to the flat land upon which were grouped the houses of the town of Deal, whose foreshore at this moment winked with its row of oil lamps, or a dim illumination in places of small lozenge-paved windows, and a brighter streak of light striking through an open door. High and dry upon the shingle rested groups of boats; and at intervals, as York approached the beach, he would catch a noise like to a rush of water upon shingle, and mark some little fabric newly launched, swiftly making off on a small buccannering cruise of its own amongst the shipping, or maybe to intercept some shadow hovering past the Goodwins with her hold full of silks, tobacco, tea, and spirits, to be 'run' before the morning, and under the noses, too, of the lookout aboard the first-rate, and the revenue people, trudging, solitary and awet, along the tall cliffs' edge or the long low line of beach.

'Many people in Deal just now?' York inquired of one of the boatmen.

'Town choke full, or allow,' was the answer. 'Take them there ships,' with a nod in the star-light towards the phantasmal huddle over the stern of the boat: 'one person from each craft 'ud be more'n enough to overflow us, and you'd say that one-third of every ship's company out yonder had come ashore.'

'A bother!' cried the young fellow, a little petulantly; 'small prospect of my hiring a bed, if it be as you say.—D'ye think there's a chance of my getting a night's rest in your town?'

'Why not?' answered the other boatman gruffly. 'Ye're a seafaring man beloiike, and there ought to be more'n one soft plank proper for sailor's bones to be found vacant at Deal.'

'No planking it for me, not if there's a mattress to be hired!' cried York. 'Suffer such a fever as has kept me wasting for six months in Valparaiso, and you'd wish your skeleton, marrowless, that it might give over aching.'

'There are inns enough, anyway,' said one of the men. 'Troy Mother Puddell's first. She keeps the sign of the *Cat o' Nine Tails*, Sandown way. There should be a chance there; and o'll tell ye whoy: her liquor's cust bad. She's beknoown for that, 'soides high terms. 'Tain't that I name her 'cause I love her; but when a sick gent wants a bed, he ain't going to be hindered by a shilling too much, let alone a quality o' liquor there's no call for him to drink.'

As the man spoke, the boat's keel grounded on the shingle, and the little craft swept broadside to the beach. York, picking up his bundle, stepped out, and inquired the fare. The boatmen demanded six shillings.

'See here,' said he, pulling out a half-guinea piece, 'this is all the money I possess, and I shall have no more until I can beg, borrow, or steal it. If I deduct six shillings from this, what does it leave me?'

'Give us foive,' said the men.

'Three,' he answered; 'for God's sake, don't take advantage of a sick sailor!'

An altercation followed; York was resolved, the boatmen importunate and clamorous, and presently offensive. Other boatmen were attracted by the noise, and soon there was a crowd of Deal men listening to the shouts of their two brethren and the cold determined remonstrances of Mr Jeremy York.

At last the tall young fellow cried out, 'Make it four shillings, then, and you shall be paid.' The others agreed; the half-guinea was changed into silver; and York walked away, followed curiously by the eyes of the group of men who had assembled.

'Tall enough for a Maypole,' said one of them.

'What's his sect?' exclaimed another. 'Looks as if his hair grewed from a woman's head.'

'Smite me,' cried one of the two boatmen who had pulled the young fellow ashore, 'if ever I takes a job again without first agreeing with the party as to terms. A dirty four shillin'! But what's a man to dew? He outs with his half-guinea piece, and says 'tis all the money he's got in the world; and who's to know that it ain't a forged bit tew? But that's Billy Tucker's consarn, who's got the coin.' He spat with disgust and lurched off, on which the group broke up, and made in several detachments for the various public-houses or inns in Beach Street.

'SPOT' AND 'FUTURES.'

THE extent to which speculative business is carried on in the modern world of commerce is vastly greater than most people are aware of. It is not only that there is speculation in every business, but speculation has become a business of itself—fully organised, equipped, and certificated. In this country, of course, we are apt to imagine that the great centre of speculation is the Stock Exchange. Doubtless it is the greatest centre; but there are other arenas in which speculation at times is greater than that in stocks. Of course it is erroneous to attempt to measure the extent of speculation in public securities by the amount of the turn-over in the Stock Exchange Clearing-house, because a very large proportion of the transactions there recorded are *bond-fide* exchanges—that is, sales and purchases—of investments. But the

Stock Exchange nevertheless remains in this country the most striking example of a place where a man may buy what he does not want, and sell what he has not got, on the chance of something turning up in his favour.

There are other departments of traffic in this country where men do the same thing, but in which, nevertheless, some tangible evidence of the article dealt in is called for. There are, for instance, in the pig-iron and petroleum markets a great many turnings-over of 'warrants' before settling-day arrives; but at last the 'warrants' must be produced by somebody, and taken by somebody else—the intermediaries merely taking or paying the differences on their respective operations. This is because in these trades the speculation is chiefly in that which is actually existing in public stores, for which the store-keepers grant receipts or warrants. These documents are, in ordinary circumstances, as readily convertible into cash as bank-notes, although at a discount, and are used as securities in obtaining money on loan.

In petroleum, as also in cotton and some other commodities, the speculation is often in 'forward' rather than in 'prompt' deliveries, or, to use the trade terms, 'Futures' and 'Spot.'

But to illustrate the operation of 'Future' and 'Spot' dealings in speculative circles, we need to take wheat. This is, next to stocks and shares, probably the object of the largest amount of speculation in the United States; and we are not sure that the operations in the wheat 'pits' are not sometimes larger than those in Wall Street in respect of the total amount of money involved. The whole annual crop of wheat in the United States averages over four hundred millions of bushels; but when speculation is brisk, more than that quantity will be bought and sold in a single market in one week.

There are three great markets for wheat in the United States—New York, Chicago, and Duluth (Minnesota). The last named is the youngest of the three, but is growing so rapidly in importance, that it is said to do as much business now as Chicago. In each of these places there is a Corn Exchange, managed by a 'Board of Trade,' and in each is a 'pit,' or amphitheatre, in which speculators gather for their peculiar operations. If a man wants to buy 'Spot' wheat—that is to say, wheat for immediate delivery for shipment, or for other purposes of legitimate trade—he goes to the Exchange, where the stands of the dealers are arranged in much the same way as in our own corn-markets. There he 'makes his deal,' and on obtaining an order on the 'elevator' for the quantity he requires, must be prepared to hand over cash in return. It is a maxim in America that 'Corn is cash,' and this maxim is supposed to be adhered to both in ordinary and in speculative dealing. Again, a man who has grain stored in the 'elevator,' merely takes his store-receipt or warrant to a dealer or broker, and obtains for it cash on the basis of the 'Spot' price of the day. He may, of course, give a limit to his broker below which he is not to sell; and if so, must wait until the 'Spot' price reaches his figure.

An elevator, it must be explained, is a public warehouse in which is stored all the grain as it comes in from the country. All wheat in America is 'graded'—that is, classified according

to quality, such as Nos. 1, 2, and 3, Spring or Winter, in Chicago; or Nos. 1 or 2, Hard Spring, or Hard Northern, in Duluth. There are many different grades; but for purposes of speculation, 'No. 2 Spring' is used chiefly in Chicago, 'No. 1 Hard Spring' in Duluth, and 'No. 2 Spring or Winter,' in seller's option, in New York.

When a farmer or dealer sends grain to an elevator, it is inspected by duly appointed officials, declared of such and such a grade, and a receipt is granted for the ascertained quantity of the declared grade. The wheat is then stored, not by itself, but in a mass with thousands of other consignments, all duly graded, so that a man never gets his own wheat out again. He merely gets the same quantity as he delivered of the particular grade.

Such a system of grading is not possible in any other country in the world but America—unless, perhaps, to a certain extent in Russia—for this reason: in America there are vast tracts of land all producing the same quality of grain. There is the 'Spring Wheat belt,' and the 'Winter Wheat belt,' and so on, phrases which indicate certain areas of country all producing the same quality. Now in this country, from climatic differences and varying mixtures of soil, there may not be two farms in one parish yielding exactly the same quality of grain; nay, on a single farm, each field may be different. A Scotch or an English farmer simply could not understand the process by which wheat is graded in America, because it is so entirely contrary to his own experience. But it is this peculiarity of American grain-growing that has enabled the business to be reduced to such a perfect system. 'No. 1 Spring Wheat,' or any other official designation, represents a fixed definite quality, which every one in the trade understands. Therefore, people buy and sell not by sample, but by grades; and all that a buyer has to do is to see that the seller gives him an order on the elevator for the particular grade he has bought.

It is this perfect system of inspection and classification that has really created the enormous speculative business in American wheat. There could not be this speculation without official recognised standards; and such standards, as we have said, are attainable in America. The grading, it must be explained, depends on the district. 'Chicago Wheat,' of whatever number, means the wheat grown in the neighbourhood of Chicago. 'Duluth' or 'Northern' wheat means the wheat grown north of a certain line; and so on. But we do not need to go into all the intricacies of grades, so long as the reader thoroughly grasps the principle of grading upon which all speculation is based.

As a matter of fact, only a small minority of those who frequent the 'pits' in Chicago and New York know anything whatever about actual quality. They have all the grades in their market relations at their finger-ends; but if put to the test, many of them would hardly be able to distinguish a sample of wheat from one of barley. They do not really trade in the grain; they neither want it nor have it to give; all they do is to buy or sell certain market chances based upon possible contingencies or probable eventualities.

Wheat speculation is confined to 'Futures' or, to use the American term, 'Options;' and to simplify our explanations we will suppose Chicago to be the scene of operations. There are other 'pits' in Chicago besides the wheat-pit, where analogous speculations are carried on; but wheat is probably the biggest medium for gambling. The form is in 'Futures' or 'Options,' and the nominal material 'No. 2 Spring Chicago.'

Let us assume, for the moment, that you want to have a speculation in Chicago wheat. You take up an official list—all prices for the day are finally 'called' at three o'clock in the afternoon by the 'Board of Trade,' and marked on the call-board, as the authoritative and inevitable bases of settlements—and you there find quotations such as these, which we take from an actual list in November 1888, prefixing first a market report:

'Wheat commenced weak at a fall of $\frac{3}{4}$ c., but afterwards rallied smartly, and developed decided strength on vigorous operations for a reaction, and "bears" buying to cover. Values [prices?] thereupon considerably improved, and after a heavy business, the close is firm at an advance of $\frac{3}{4}$ c. to $\frac{1}{2}$ c. Sales 10,800,000 bushels. Nothing doing in "Spot."

Then follow the official closing quotations for the day—these figures being cents per bushel of 60 lbs.:

November.....105 $\frac{3}{4}$	February.....109 $\frac{1}{4}$
December.....105 $\frac{1}{2}$	March.....110 $\frac{3}{4}$
January.....107 $\frac{3}{4}$	May.....113 $\frac{3}{4}$

Perhaps you are struck with the remarkable disparity between November-December and May prices, and you think that the latter are in the circumstances too high. In that case, you may go to a broker and say: 'Sell for me in the morning 5000 bushels' (which is a moderate 'deal') 'of May wheat at 113 $\frac{3}{4}$,' or any other figure you like to place as a limit. In the morning the broker goes to 'the pit' and calls out: 'I sell 5 May 13 $\frac{3}{4}$;' and another broker holds up his hand and says: 'I buy.' Each notes the transaction on his card, and sends it in to the managing Board. Your broker then sends you intimation of what he has done, and the bargain is completed. If you do this in November, you have five intervening months in which to take the chance of the market. During these months, 'May wheat' may never come near the price at which you sold; if not, you have still all May, upon any one day in which month you may buy to cover yourself and tender to your buyer. But you will not do anything of the sort in reality; for you will simply on some suitable day arrange to close the transaction at the official closing quotation for 'May wheat' and pocket or pay the difference. You will never see any wheat, and you will not pay a cent for real wheat, but merely pay or receive the difference between the price at which you sold an imaginary article and at which you are supposed to buy another imaginary article.

This is a simple operation in 'Futures' or 'Options;' but other dealings are more complicated. Suppose, for instance, you think that 'December wheat seems quoted too cheap in comparison with 'January,' and that the former ought to rise to something like the level of the latter. You give an order, in November, to buy, say, 5000

bushels 'December wheat' at quoted rate. But if on the very first day of that month the seller chooses to tender what you have bought, you must either pay him cash for the quantity of wheat, and receive an elevator receipt for it—thus turning your speculation in 'Futures' to one in 'Spot'—or else pay him the difference between your purchase price and the official price at three o'clock. If you have not done one of these two things by three o'clock, you are treated as a defaulter. It is noteworthy that while a seller is not supposed to compel a buyer to take the actual goods, a buyer can always demand the goods rather than the difference. In practice, however, dealers in 'the pit' neither want to give nor to take the actual wheat, and, in fact, there is not available wheat in existence sometimes to represent the transactions of a single day.

To return to your 'December' operation, however. If your calculations are upset in the manner suggested, you pay your difference and buy another lot, and so on as long as you choose, or as your purse can hold out, until the turn comes in your favour. For dealings in 'Futures,' it will thus be seen that the further you can operate ahead the more scope you have to 'make a spoon or spoil a horn.' Of course, the actual price of wheat in May, when the month arrives, may be very different from the price at which 'Futures' for that month are dealt in to-day. Again, a man of capital who sells 'Futures' at long prices may, rather than stand the racket of the market, buy 'Spot' to an equivalent extent, lock up the warrants in his safe, and keep them until he can tender them in implement of his sales. His costs in this case are the interest on his money and the elevator charges for storing.

It sometimes happens that the price of 'Futures' is lower in New York than it is in Chicago, although to bring to the former place means something like a thousand miles of railway carriage. This condition is, of course, abnormal and purely due to the momentary course of speculation. On the date of the quotations given above, New York was from $\frac{1}{2}$ to 1 cent cheaper than Chicago; while west of Chicago, in the smaller towns, the price was as much dearer. This meant that the farmers were 'strong,' and were speculating for a further advance. It is when these differences in the markets occur that 'straddling' begins. A 'straddler' is a man who buys in one market and sells in another. Thus, if the price of New York 'Januaries' is lower than in Chicago, he buys in the one place and sells in the other at the same moment. He cannot, of course, deliver New York wheat to his Chicago buyer; but he continues to manipulate his transactions in both 'pits' until he can work out a project—or the reverse; for 'straddlers' often come to grief, as a very big specimen of the tribe did just before these lines were penned.

There is another kind of dealing in 'Futures'—that by the Western farmers. A farmer has his crop ready for market, say, in the month of December; but he sees then that December wheat is quoted in Chicago only 105 or 106 cents, while 'May' is quoted 113 or 114. So, instead of sending forward his wheat, he puts it in his barns, and sends an order to a broker to sell for him so much such a grade for 'May' at

113½, or whatever limit he chooses to place. When this is done, he really has obtained seven or eight cents per bushel more for his crop than if he sold it at once; but he will not get the money till May, when he sends forward the wheat to the elevator and tenders delivery. It does not matter if the original buyer does not want it, and cannot pay for it; somebody else will buy the 'Spot' wheat, and the first buyer will pay the farmer the difference.

This mode of doing business is attended with this objection, that it offers too much temptation to the farmer to speculate. He may sell his 'Futures,' and still send forward his wheat to be converted into cash as 'Spot.' In this case he has no cover for his 'Future' sale, and stands just in the position of an outside speculator, while the money in hand may lead him into many extravagances. It is said that many of the Western farmers are extensive speculators in this way.

A curious case of sellers of 'Futures' or 'Options' being 'cornered'* occurred in Chicago recently, and as one example is worth pages of explanation, we will give the story.

Mr H—— was long known as the 'Champion Scalper and Speculator' in the 'Board of Trade'; but outside Chicago his fame had not spread until he successfully 'ran' the 'closest and best managed corner' ever made in the United States. This gentleman had by 'scalping'—that is, manipulating the market for small profits—amassed a large amount of ready cash, always by 'operating against the crowd,' on the theory that 'the crowd' is always wrong. But in September, Mr H——, guided by some knowledge or instinct, took a novel course for him. He quietly bought all the wheat that was offered for that month, and ran the price of 'Septembers' to a premium above the succeeding months. 'The crowd,' tempted by this premium, kept on selling 'Septembers' freely, in the belief that by 'selling down' they would frighten him out and force him 'to part.' But 'old H——' went on buying all they offered until he had almost every dealer in the 'pit' on his books. Then one fine day near the end of the month he called in some of the sanguine sellers to his sanctum and showed that not only did he hold 7,000,000 bushels of 'September,' but that he had acquired the entire stock of 'No. 2' in Chicago—'Spot'; while the wheat that was coming forward was not of that grade, and would not be accepted in fulfilment of September sales.

This was his 'corner,' and very snug it was, although the speculators laughed at his offer to let them off at ten or fifteen cents difference. There was still a week to run—plenty of time to get wheat forward from the West, and otherwise to work the market. Express trains were put on to bring wheat from St Louis and other places, and bold speculators went on selling in the confidence of a final crash. H—— bought it all; and then the New York 'straddlers' came in, tempted by the premium over their market, and sold more still. To stimulate them a little, Mr H—— let the price fall away a cent or two, so as to give the impression that he had reached the end of his tether. But he bought back his own stuff through other brokers, and everything that was

offered, until—to make a long story short—on the last day of September he had the whole 'crowd' on their knees; and men who had scornfully rejected his former easy terms, had to pay him in the end something like a dollar per bushel of 'difference.' It is said that Mr H—— cleared over two millions of dollars by this 'corner.' At anyrate, the incident illustrates the dangers which attend those who sell 'Options.'

On the other hand, speculators who have bought 'Options' to a large amount in order, to make similar 'corners,' have been more often caught themselves, by either being unable to control the 'Spot' wheat, or by miscalculating the supplies to come forward, or through some other error or weakness. In short, the majority of speculations in wheat, as in everything else, turn out failures; and we remember once hearing it said by one, who knows the place well, that in Chicago you cannot throw your boot out of a window without hitting a 'busted millionaire!'

Of course, this kind of speculative business is highly demoralising, and economically as well as ethically wrong. But whether the speculations of New York, Chicago, and Duluth really affect the price of wheat to the consumer in the long run, is very doubtful. At times they run up the price artificially; but there is always a corresponding relapse. 'Corners' can never be maintained for long, and when they are swept out, it is generally at a heavy sacrifice.

All the speculation of this kind in wheat, however, is not confined to residents in New York, Chicago, and Duluth. A great many Germans and French join in it by cable, as do also many Britons. Indeed, there are feeble copies in this country of the Chicago system. Liverpool has now a 'Futures' wheat market in which the standard for speculation is 'Californian No. 1 White Wheat.' The transactions in this are very large, but nothing like those of the American 'pits.' London has also formed a 'Futures' market, and has fixed a standard called 'London Wheat,' a term which is defined to mean 'Red Winter,' 'White Californian No. 1,' or 'Oregon Amber No. 1' (with the option of two or three other qualities at fixed differences). But the standard is too nondescript; and speculators will not go in freely to buy when they are not sure that they can sell in the open market that which they may be compelled to take in the 'Futures' market. Both Liverpool and London, in short, lack the perfect system of inspection and grading which is the very foundation and support of wheat speculation in America.

CURIOUS WAGERS.

It has been remarked that 'a collection of foolish wagers would make a voluminous work;' and so odd are some of these 'fools' arguments,' as Butler pithily terms them in his *Hudibras*, that a selection of some of the most curious may prove not uninteresting.

During the last century, when, particularly in Club-life, the least difference of opinion frequently ended in a bet, many remarkable and eccentric wagers were made. From Mrs Crackenthorpe, the Female Tatler of 1709, we learn that the fashionable young men of her day were quite as much at a loss how to kill time as are their modern compeers. Ridiculous wagers, generally

* For explanation of 'Corners' see *Chambers's Journal*, No. 19, vol. 1, Fifth Series.

governed by whim and extreme folly, were frequent. She tells us: 'Four worthy senators lately threw their hats into a river, laid a crown whose hat should swim first to the mill, and ran hallooing after them; and he that won the prize was in a greater rapture than if he had carried the most dangerous point in parliament.'

One Sunday in June 1765, a wager of one thousand guineas was decided between two noblemen, one of whom had constructed a machine which was to propel a boat at the rate of twenty-five miles an hour. A canal was prepared near the banks of the Thames for that purpose; but, by some fatality, the tackle breaking, the wager was lost.

Men of note, however, not content with representatives, have been known to wager upon their own individual prowess in the water. It is recorded of Sir John Pakington, called 'Trusty Pakington' (Queen Elizabeth called him 'her Temperance'), that 'he entered into articles to swim against three noble courtiers for three thousand pounds, from the bridge at Westminster to the bridge at Greenwich; but the queen, by her special command, prevented the putting it into execution.'

In 1729, a poulterer of Leadenhall Market betted fifty pounds he would walk two hundred and two times round the area of Upper Moorfields in twenty-seven hours; and accordingly proceeded at the rate of five miles an hour on the amusing pursuit, 'to the infinite improvement of his business, and great edification of hundreds of spectators.'

To characterise the follies of the day, it will be necessary to add to the account of the walking man another of a hopping man who engaged, in December 1731, to hop five hundred yards in fifty hops in St James's Park. He performed the feat in forty-six.

In February 1770, a bet was laid by a noble earl, that he should find a man who would ride to Edinburgh and back again to London in less time than another noble earl should make a million dots in the most expeditious manner that he could contrive.

In September 1789, a Colonel Ross set out from London for York, on a wager with a Mr Pigot of eight hundred guineas that he reached his destination in forty-eight hours on the same horse. He performed the journey three hours within the limit.

On the 17th of May 1817, a respectable farmer of Kirton-Lindsey, for a wager of a few pounds, undertook to ride a pony up two pair of stairs into a chamber of the *George Inn*, and down again; which feat he actually performed before a numerous company, whose astonishment was heightened by the rider being upwards of eleven-stone weight, and his horse less than thirty stones. They were weighed after the feat, to decide another wager.

Southey makes mention in his *Commonplace Book* of a Norfolk gentleman-farmer, who rode his own boar for a wager from his own house to the next town, four and a quarter miles distant, twenty guineas the wager, the time allowed being an hour. 'Porco' performed it in fifty minutes.

In the *Annual Register* for 1788 we find the fol-

lowing: 'A young Irish gentleman, for a very considerable wager, set out on Monday, September 22, to walk to Constantinople and back again in one year. It is said that the young gentleman has twenty thousand pounds depending on the performance of the exploit.'

It was during the same year that 'Jerusalem' Whalley made the journey which earned him his name. Being asked on one occasion where he was going, he answered in jest, to Jerusalem. The company present offered to wager any sum that he did not go there; and he took bets to the amount of between fifteen and twenty thousand pounds. The journey was to be performed on foot, except so far as it was necessary to cross the sea; and the exploit was to be finished by playing ball against the walls of that celebrated city. In the *Annual Register* for 1789 it is stated that 'Mr Whalley arrived about June, in Dublin, from his journey to the Holy Land, considerably within the limited time of twelve months.'

The above wagers, however whimsical, were not without a precedent. Some years before, a baronet of some fortune in the north of England (Sir G. Liddel) laid a considerable wager that he would go to Lapland, bring home two females of that country and two reindeer in a given time. He performed the journey, and effected his purpose in every respect. The Lapland women remained in this country for about twelve months; but having a wish to go back to their own country, the baronet furnished them with means and money.

One of the Corbets of Sundorne Castle, near Shrewsbury, made a bet that his leg was the handsomest in the county or kingdom, and staked on his part his magnificent estates. He won. There is a picture in Sundorne Castle representing the measuring of sundry legs.

Popular tradition has long associated the assumption of the Ulster badge—the bloody hand—by the Holte family of Aston, with a barbarous murder committed by Sir Thomas Holte upon his cook, whom he killed with a cleaver. This was about the commencement of the seventeenth century. It need not be said that the assumption of the badge has no connection whatever with this circumstance, which may or may not have occurred. 'The most probable tradition,' says Mr Davidson, the historian of the family, 'of the cause of the commission of the crime, is that Sir Thomas, when riding from hunting, in the course of conversation laid a wager to some amount as to the punctuality of his cook, who, most unfortunately, for once was behind time. Enraged at the jeers of his companions, he hastened into the kitchen, and seizing the first article at hand, avenged himself on the domestic.'

In 1771, a strange trial took place before Lord Mansfield in the court of King's Bench, with the object of recovering the sum of five hundred guineas, laid by the Duke of Queensberry (then Lord March) with a Mr Pigot, whether Sir William Codrington or old Mr Pigot should die first. It had singularly happened that Mr Pigot died suddenly the same morning of the gout in his head, but before either of the parties could by any possibility have been made acquainted with the fact. By the counsel for the

defendant it was urged that (as in the case of a horse dying before the day on which it was to run) the wager was invalid and annulled. Lord Mansfield, however, was of a different opinion; and after a brief charge from that great lawyer, the jury brought in a verdict for the plaintiff of five hundred guineas, and sentenced the defendant to pay the costs of the suit.

At the York assizes in March 1812, a trial came on in which the Rev. B. Gilbert was plaintiff, and Sir Mark Sykes, Baronet, defendant. It appeared that the Baronet, at his own table during a dinner party, in the course of a conversation respecting the hazard to which the life of Bonaparte was exposed, had offered, upon the receipt of one hundred guineas, to pay one guinea a day as long as he (Bonaparte) should remain alive. Mr Gilbert suddenly took up the offer; but finding that the sense of the company was against making a serious matter of a bet proposed at a moment of conviviality, he said: 'If you will submit, Sir Mark, to ask it as a favour, you may be off.' This the Baronet refused to do. The hundred guineas were sent by Mr Gilbert, of which Sir Mark acknowledged the receipt, and he had continued paying the guinea a day for nearly three years. At length he declined further payment, and this action was for recovery of the sum still due upon the contract.

The Earl of March above mentioned, on laying a bet that he would cause a message to be despatched a certain distance quicker than any horse could convey it, won his wager by enclosing the message in a cricket ball, which was thrown from hand to hand by relays of professional cricketers. As Duke of Queensberry, he betted one thousand guineas that he would produce a man who would eat more at a meal than any one whom Sir John Lade could find. The Duke was informed of his success—not being present at the achievement—by the following bulletin from the field of battle: 'My Lord, I have not time to state particulars, but merely to acquaint your Grace that your man beat his antagonist by an apple pie.'

At White's Coffee-house, where, during the last century, gaming was carried on to heavy amounts, a book was always laid upon the table for entering wagers, and in these betting-books, some of which still exist, may be found bets on all conceivable subjects: on marriages, births, deaths; on the duration of a ministry, on the chance of an election, on a rascal's risk of the halter, or the shock of an earthquake. Bets were made that Sarah, Duchess of Marlborough, would outlive the old Duchess of Cleveland; that Sir William Burdett, a member of the club, and 'a man of infamous character,' would be the first Baronet to be hanged; and Lord Mountford laid a wager of twenty guineas with Sir John Bland, that Beau Nash outlived Colley Cibber. Lord Mountford and Sir John Bland both blew their brains out in 1755; Cibber died two years later; and Nash survived till 1761.

Walpole, writing to Sir Horace Mann, September 1, 1750, says: 'They have put into the papers a good story made at White's. A man dropped down dead at the door, and was carried in. The club immediately made bets whether he was dead or not; and when they were going

to bleed him, the wagers for his death interposed, and said it would affect the fairness of the bet.'

Certain it is that during this period no subject appears to have been too serious for a bet; and that nothing was considered too trivial a medium, the following lines, founded on fact, bear witness:

The Bucks had died, and deep in council sat;
Their wine was brilliant, but their wit grew flat.
Up starts his lordship—to the window flies,
And lo! 'A race! a race!' in rapture cries.
'Where?' quoth Sir John.—'Why, see two drops of rain
Start from the summit of the crystal pane:
A thousand pounds which drop, with nimble force,
Performs its current down the slippery course.'
The bets were made: in dire suspense they wait
For victory, pendent on the nod of Fate.
Now down the sash, unconscious of the prize,
The bubbles roll, like pearls from Chloe's eyes.
But, ah! the glittering joys of life are short;
How oft two jostling steeds have spoiled the sport!
So, thus attraction, by coercive laws,
Th' approaching drops into one bubble draws.
Each cursed his fate that thus their project crossed:
How hard their lot, who neither won nor lost!

AN OLD CHAPTER RARELY READ.

'WHO is the first king mentioned in the Bible?' is a question frequently asked by some ingenious youth 'seeking occasion' against his elders. Of course the elderly persons so entrapped think of every one but James I. of England. They are indeed pretty sure to betray a lamentable ignorance of a chapter which for two hundred and seventy-eight years has been printed at the beginning of everybody's English Bible—namely, the solemn dedication of the authorised version of the Scriptures to the 'most dread sovereign' who had set the translators to work. But nobody ever looks at it nowadays, which is a pity, as it well repays the trouble of perusal.

The first thought of any casual reader of this old and, in a sense, forgotten chapter, written in 1611, would be a feeling of surprise that such a delightful bit of 'the antique' should be in everybody's hands and yet almost entirely unknown. It comes from a period not so very remote from our own; but its contents read like a story from the depths of the middle ages. Events have moved so fast, and the whole character of English society has been so completely changed, that we hold our breath in amazement at the cringing subservience and fulsome adulation of this address. It seems scarcely credible that within three hundred years of our own day such a spirit and posture should have been found in sturdy Englishmen, still less in the ripest scholars of the time. But so it was; and though the compliments were probably intended to be taken *cum grano salis*, their laboured affectation of sincerity manifests a temper entirely alien to the spirit of independence we like to ascribe to our ancestors.

But this dedication is worthy of attention for other reasons. It is said to have been written by the Bishop of Gloucester, and is distinguished by great picturesqueness of style and much elegance and force of language. It begins with a graphic sketch of the Reformed Church of England as 'our Sion,' encompassed by evil-wishers whose expectation it was that 'thick and palpable clouds of dark-

ness' would overshadow it, at the critical moment which they describe as 'the setting of that bright Occidental Star, Queen Elizabeth.' 'Occidental Star' is good! It sounds well, and it gives 'the wise men' of the West a luminary of their own to follow. But a star after all is not the brightest object in the firmament, however beautiful it may be in evening's twilight. And our good translators hit a weakness of 'the Most High and Mighty Prince' when they reserved a bolder figure for himself, and hailed 'the appearance of his majesty as of the *Sun* in his strength!' The king could not complain of the inevitable compliment to good Queen, Bess, whom the people had taken to their hearts; but it may be doubted whether he held her altogether in 'happy memory.' Time had doubtless brought round its revenge; but he could scarcely have forgiven or forgotten the tragedy at Fotheringay. Cleverly, therefore, is the flattery turned which overpowers the radiance of the 'Occidental Star' with the rising glory of the '*Sun* in his strength.'

And there was something in it. For most certainly the accession of James raised legitimate hopes of a long period of stable prosperity to the land and throne. Had that monarch been less of a Solomon in his own esteem, and endowed with common-sense instead of learning, it is probable that the whole course of events would have been different. The development of England's liberties might have been accomplished without the violence of revolution, and the king's children's children seated on the throne securely. But for want of *savoir-faire*, the sunshine of His Majesty's early years was speedily overclouded: 'the supposed and surmised mists' were dispelled only for a space; thunder was in the air, and presently a storm burst forth which wrecked both the altar and the throne.

It is touching to read the allusion to His Majesty's 'hopeful Seed,' when we recollect their misfortunes. They were now only two boys and a girl. The eldest, Prince Henry, died the very next year after the issue of this version of the Scriptures; the other boy became Charles I.; and the girl, Elizabeth, afterwards wedded to a German prince, unfortunately in war, speedily became a widow, and in her case a very Niobe of tears. It makes such a difference *which* end of the telescope of time you look through! Who could have foreseen that errors of judgment and want of statecraft could so soon have ruined these sanguine hopes of His Majesty's scholars! They appeared to have reason on their side, for in their sovereign had they not, in place of a capricious woman, 'the confidence and resolution of a Man?' Was he not a 'sanctified Person,' whose 'very name is precious' to his people? Yet how soon was their forecast of events overthrown! The royal house of Stuart is now practically extinct.

But we may easily forgive the scholars of King James for building their hopes on 'so learned and judicious a Prince.' Relying on such a patron of their important task, they securely bid defiance to 'self-conceited brethren.' It was the fashion in those days to ascribe a difference of opinion to 'some moral defect; and the criticisms of opponents are discounted beforehand by our translators as 'calumniations and hard interpretations.' They quite expect to receive 'the censures of ill-meaning and discontented persons, who are sure to like

nothing which is not hammered on their anvil.' But the translators are not afraid, though they may be 'traduced and maligned,' being 'supported within by the truth and innocency of a good conscience,' and sustained 'without by the powerful protection of Your Majesty's grace and favour.' Nobody in these days would dream of giving either of these reasons in supporting the goodness of a translation! They had, however, sounder reasons, which they are too modest to mention, for their self-confidence; for their scholarship and mastery of their mother-tongue have made their work 'the wonder of the world.' This they hope and pray the king himself may be, by reason of his being 'enriched with singular and extraordinary graces.' The result destroys any claim they may have had to prophecy, but has established the excellence of their translation. It has laid hold on the affections of Englishmen through the generations of three centuries: it has enriched and settled the language, as Luther's Bible did for German; and with all its faults, it still holds its ground, and can give long odds to all the revised and re-revised versions of the present day. The dedication itself is written in graceful and telling English; and there is not a word in it which has become obsolete or even antiquated. It is a good specimen of the version itself, which is indeed 'a well of English undefiled.' We may smile at its stilted panegyric of a Prince whom later historians have described as 'a learned fool,' and may wonder at the spirit of bondage in its expressions of loyalty. But still these side-lights on a former age are full of interest and instruction, and the dedication may be profitably read as a telling chapter in the history of England, and a striking sketch of men and manners in that critical period of the British nation.

RESURGAM.

THE Winter morn of cheerless gray
Dawns slowly up the sky;
And in the cold, bleak light of day,
The drifting snow-wreaths lie.

And all green things are lost to sight
Beneath a weight of snow,
And down into the cold, dark night
The Winter day doth go.

But 'mid the gloom of wintry skies,
I see a vision fair
Of fresh Spring morns that brightly rise
With sweet and balmy air.

Even thus, most gracious Lord, amid
The gloom of death, we see
Life everlasting, safely hid
And garnered, Lord, in Thee.

The dreary grave is but the field
Where lies the hopeful grain,
And what with many a tear we yield,
Shall be our own again.

CURIOUS COURT CUSTOMS IN AUSTRIA.

THE Emperor of Austria, King of Hungary and Bohemia, is a faithful observer of ancient customs. His reign has witnessed many political changes; but the etiquette of court, its ceremonials and pageants, have scarcely undergone a change since he came to the throne forty years ago. Every Maundy-Thurs-day His Majesty publicly washes—or pretends to wash—the feet of twelve old men. On Easter Eve he walks in the Procession of the Holy Sepulchre. On Easter Sunday he holds his Chapter of the Golden Fleece. On Corpus Christi Day he walks, wax taper in hand, through the principal streets of Vienna, accompanied by his entire court, his ministers, great officers of state, and knights of the imperial orders. Once a year he gives a ball, to which only the *Hoffdiner* or persons with sixteen quarterings of nobility are invited; and once a year he places the state apartments of his palace at the disposal of a Committee of bankers, manufacturers, and merchants, who give an Industrial Charity Ball, managed by themselves. For the rest, the arrangements of the imperial household as regards the employment and pay of servants proceed on a system which must be three centuries old, and a system which is based largely on perquisites. An idea of it will be conveyed by the fact that nothing which is served at the imperial tables ever appears a second time; meat, confectionery, bonbons, fruit, flowers, wines, wax-candles, all become the perquisites of various butlers and footmen.

The Maundy-Thurs-day function of the *Fuss-waschung* (feet-washing) was instituted in the sixteenth century by Charles V., but much earlier in Hungary by King Stephen, and it was intended as a lesson in humility for the sovereign and his consort. On the appointed day, all the great dignitaries of the empire, with members of both houses of parliament, officers on court service, and members of the nobility in gala uniforms, assemble in the Throne Room of the Hofburg shortly before ten in the morning. Tiers of seats have been erected all round the room for the

diplomatic body, the press, and guests admitted by ticket—all the ladies invited being expected to appear in black without bonnets. Presently, a couple of folding-doors are thrown open, and through them enter, in single file, twelve old men and twelve old women, each escorted by two or three friends. They have been selected from the most aged among the poorest class in Vienna, and they are all dressed in sixteenth-century costumes: the men wearing black tunics with broad white collars, knickerbockers, and shoes; and the women, black dresses, with close-fitting starched caps.

These poor people take their seats at two long tables set on opposite sides of the room; and punctually at ten the Emperor and Empress arrive, attended by the Archbishops and Archduchesses, a throng of court officials, and the clergy of the metropolitan chapter, headed by the Archbishop of Vienna. A priest ascends to a lectern and intones a prayer; after which the serving of a sumptuous meal to the almsfolk is at once proceeded with. Four-and-twenty stalwart life-guardsmen, in gold-laced scarlet coats and plumed helmets, march in, carrying trays, on which stand a tureen of soup and two plentiful dishes of fish. The trays are cleared at the men's table by the Emperor and eleven Archdukes or Princes; and at the women's table by the Empress and as many Archduchesses or Princesses. This ceremony is repeated three times more; for a tray with three entrées follows the first; then comes a tray with three sorts of roast and vegetables; and lastly, a tray with sweets and fruit. The almsfolk, however, do not touch these dainties. The Emperor and Empress ask them if they desire to eat, and, on a negative sign being made, the tables are cleared in the same order as the serving—that is, the life-guardsmen come in and go out four times with their trays. After this they enter once more, to remove the jug of wine, silver goblet, plate, knife, fork, spoon, and napkin which form each 'cover.' All these articles, along with the dishes of food, are carried to an anteroom and there packed in large white boxes emblazoned with the

imperial arms; and an hour later these boxes are delivered at the houses of the different almsmen and almswomen, and become their property. The wine-jugs are of a peculiar pattern, coloured green, with the imperial escutcheon highly gilt, and the date of the year on a white scroll. They are much prized by collectors, as only twenty-four are made yearly, and these can only be purchased from the actual recipients.

Once the meal has been carried out, the tables are removed and the foot-washing begins. A number of pages kneel and puff off each almsman's right-leg stocking and shoe. The same office is performed for the women by maids of honour. Another prayer is then intoned; and the Emperor and Empress, drawing off their gloves, kneel, and proceed respectively to pour over the feet of each man and woman a little water out of a golden ewer. This ewer is handed by a chamberlain, another chamberlain holds a golden basin, and a third a lawn towel. The towel serves for the drying of the feet, this being also done by the Emperor and Empress. When the function is over, pages and maids of honour advance again to replace the shoes and stockings; and the last act of the ceremony consists in the bestowal of twenty-four purses, containing each fifty florins in gold coins fresh minted. These purses are hung round the necks of the recipients. The whole service lasts about half an hour, and is conducted with the most impressive order and gravity. Of late years it has been shorn of half its attractions because the Empress has been debarred by ill health from performing her own part in it; but in all except the actual foot-washing, twelve almswomen have been annually favoured as though Her Majesty were present.

The Easter Eve Holy Sepulchre Procession, which takes place within the courtyards of the palace, and the Easter Sunday Chapter of the Golden Fleece, which is held in the private chapel of the Hofburg, call for no particular description. The Golden Fleece is the 'Garter' of Austria-Hungary.* The insignia are a golden sheepskin hung round the neck with a scarlet ribbon. But on Chapter Day the knights wear their velvet mantles and golden collars. The ceremonial of the Chapter consists only in a roll-call, a mass, and the administration of the holy communion to every knight; but as the Court Chapel is very small the spectators are few. The Corpus Christi Procession, on the other hand, is witnessed by tens of thousands, and is a very gorgeous pageant indeed. Like all ceremonies in which the Emperor takes part, it is held very early in the morning, for His Majesty has no notion of spending the best hours of the day in bed. By six A.M. the principal streets of Vienna over a circuit of about a mile are crowded with a multitude of sightseers, and every window is thronged. In front of every church which the procession is to pass there stands an open air shrine or altar covered with flowers. Punctually at seven o'clock a long line of gala court chariots, drawn by eight, six, or four horses, drives up to the west door of St Stephen's Cathedral. The Emperor is always dressed for these occasions in the uniform of an Austrian field-

marshal—white tunic, scarlet trousers, and cocked-hat with green plumes. The square in front of the cathedral is kept clear by the Austrian life-guards in scarlet and riding black horses, and by the Hungarian Guards on dapple grays. These splendid troops, which are always on duty within the palace, are very seldom seen on horseback except on this one day of the year. The Hungarian Guards wear red hussar tunics embroidered with white lace, leopard skins over their shoulders, yellow boots, and gray bearskin busbies with plumes.

A service is solemnised in the cathedral, and then the procession streams forth. The Hungarian Guards ride first with blaring silver trumpets; then come surpliced choristers, swinging censers and chanting; monks black, white, brown, and gray, also chanting and carrying banners; deputations of the clergy from the various city churches with parochial banners; the Knights of the Teutonic Order with long black gauntlets, breast-plates, and white mantles; the Knights of Malta with white tunics and scarlet crosses; and officers of every grade with civil functionaries in uniform. After these, there are more choristers and monks, and then the Cardinal-Archbishop of Vienna, walking under a canopy and holding the eucharist. Close behind the canopy walks the Emperor bare-headed, and holding a long lighted wax-taper of three pounds weight. His Majesty is followed by a host of archdukes, princes, generals, cabinet ministers, and knights of the imperial orders with their collars—all barcheaded too, and most of them carrying tapers. The procession moves along a gangway of boards laid down in the streets and strewn with rushes; and as it advances, the soldiers, who line the pavement on both sides, present arms; the men in the crowd take off their hats, and some of the women fall on their knees. Meanwhile, loud peals are being rung from the cathedral tower and all other church steeples; and this ringing of bells blending with the flourishes of trumpets, the canticles of the monks, and the admiring murmurs of the vast multitude, forms a very stirring harmony. The procession stops several times on its way, for at every one of the open-air altars the Emperor pauses to offer up a prayer. Finally, the pageant wends its way back to the cathedral, where a benediction is delivered from the high-altar; then all is over. From first to last the Corpus Christi service and procession occupy about three hours.

From such a religious ceremonial to a court ball, the transition is abrupt; but the annual ball of the *Hofkugel* deserves notice because of the extraordinarily minute and severe rules which regulate admission to it. The dispenser of these invitations is the Grandmaster of the imperial household, Prince Hohenlohe-Schillingfürst; but his discretion is strictly limited. Noblemen and noblewomen who can boast sixteen quarterings of nobility—which means eight pairs of ancestors noble in the male and female lines—may claim invitations as a matter of right; but if any one among a man's eight direct forefathers has married out of the aristocracy, his escutcheon is 'barred'; and even if his family boasted ever so many quarterings before this *mésalliance*, they do not count. Last year, a rule was made admitting the wives of cabinet ministers to the same privileges

* There is a Spanish branch to the order. All the members both in Austria and Spain must be Roman Catholics. No exception to this rule is ever allowed.

as ladies of the diplomatic body, whose genealogies are of course not inquired into; but this was considered a great innovation, and it was strictly provided that the ministers' wives should only have admission to the court balls while their husbands were in office. This year again another innovation was made by the admission of Baron and Baroness Alfred de Rothschild to the ranks of the *Hofdilig*. No person of the Jewish religion had ever before been admitted to the court ball; and purists in the matter of heraldry shook their heads over this concession, wondering where 'the line would be drawn' in the future. It is one of the peculiarities of the court ball that a particular kind of soup is always served at supper. This soup is a *consommé* or strong broth served cold, and of which the stock has been boiled from fifteen different kinds of meat, fowl, and game. The recipe of this broth has been used in the imperial kitchens for more than three centuries.

Talking of the imperial kitchens brings one to the extravagant waste which is suffered in the Emperor's household. As already said, nothing except the linen, plate, china, and glass is ever served twice at the court tables; but the full meaning of this cannot well be grasped by anybody who has not seen the system at work. Some of the servants have as their perquisites the bottles which have come up to the dining-room but have not been uncorked; others, the uncorked bottles; and others, again, the wine that remains in the glasses. Therefore it is the interest of one set of servants to keep the glasses full; of another set to draw as many corks as possible, while parting with as little wine as they can; and of a third set to draw corks sparingly. The result is that often a great deal of unseemly whispering and nudging goes on at the sideboards. As regards the food, too, there are different orders of claimants for perquisites: one man having a vested interest in the joints, another in the poultry, a third in the sweet dishes, and so on. Then there are the men to whom the wax-candles belong, and these naturally make a rush to blow out the candles the moment the last guest has walked out of the room. Altogether, this system of perquisites causes the imperial banquets to be served in double-quick time, so that the longest of them seldom lasts beyond three-quarters of an hour. The Emperor's dining hour is five o'clock; but it is etiquette for the guests to arrive a clear half-hour beforehand. After dinner, coffee and cigars are served in a smoking-room; the Emperor lingers about a quarter of an hour, and the guests separate soon after half-past six.

But another curious result of the perquisite system is this—that the court servants make open traffic of the imperial leavings. Incredible as it may sound, there is a basement corridor in the Palace which is like a bazaar full of shops. Here not only the keepers of small hotels and restaurants, but the cooks of many ladies belonging to the second-class official world, come to buy cold meats, pastry, sweetmeats, wines, and candles. There is one sort of Tokay which can only be bought from the court servants, as none is made except for the Emperor: it is to be presumed, however, that the uncorked bottles of champagne and other fine wines are generally sold by the dozen, and they must form a very substantial perquisite.

Why this prodigal system has never been reformed, it would be difficult to say, unless it be that the Emperor is too good-natured to disturb vested interests. Perhaps, too, no really economical system of reform has ever been submitted to His Majesty. Formerly, the same waste went on in the households of the archdukes; but the Archduchess Maria Theresia, wife of Archduke Charles Louis, the Emperor's brother, determined at length to put a stop to it in her own house, and so entered into a contract with her chief cook for the supply of so many meals a day at so much per head. It is to be feared, however, that the illustrious lady had not acquired her own notions of housekeeping in a very frugal school; for the sum allowed to the cook for the early breakfast of tea or coffee with rolls and butter and either two eggs, a couple of sardines, or a slice of ham (but not all three), was fixed at two florins, or about four shillings a head!

• JOHN VALE'S GUARDIAN.

CHAPTER III.

WILLIAM found the time hang on his hands in a very desolate fashion, though, in spite of grief and anxiety, he slept through his nine hours in bed that night without so much as a turn or a dream, having that blessed faculty as a result of youth and perfect health. But the next morning's walk to school, and the evening walk home again, were lonely and wretched enough, with no John to run with and loiter with and chatter with. Even the savages were gone, frightened out of the field by the damage they had done, and life in general became for William as dull as ditch-water. If the dullness had been all, he could have borne it better; but his small world took occasion so to preach at him, and to show him into what danger he had led a quiet and inoffensive companion by his turbulent ways, and everybody so girded at him, and so prophesied evil, that at times he was half beside himself with his fears for John, and that ~~worrying~~ against injustice which children feel, though they get so rarely credited with it by grown-up people.

What with low fever and high fever, and delirium, and paroxysms of headache, poor John had a bad time of it. But the worst of all was that he came out of his illness a changed creature, dazed and timid, and for a time he seemed 'too simple-minded to be altogether himself,' as his father owned. That unlucky blow put the mental clock back a year or two, and deranged the works somewhat into the bargain. If he tried to think too hard, his head would begin to ache and swim; and if people were too severe with him, as they pretty often were, it would seem to throw him off his mental balance altogether.

Vale was a busy man, being nothing less than farmer, miller, and maltster all at once, and with the best will in the world could give but little time to the boy. It was out of the question to send John to school again, for any little attempt to study brought on one of his headaches and quite disabled him. His bulldog companion, with that soft and repentant heart

under his tough exterior, stuck to him with the fidelity of his tribe, and evening after evening, on his coming home from school, would drain his mug of milk standing, and then race off with his provender in his hands, munching it by the way, to give his injured chum society. But except for Wednesdays and Saturdays, each of which brought young Gregg a half-holiday, John's mornings and afternoons were solitary, and he used to moon about the fields and crawl into quiet corners out of the sun, and would sit there alone and unoccupied for hours, with his own dim thoughts and fancies for his sole companions.

Nearly all the folks thereabouts were farmers or farm-labourers; and about half a mile from John Vale's house lived a farmer of the name of Day, a fat comfortable man of middle age, who had a single child, a daughter, called Lydia. She was at this time a wonderfully pretty little creature, with jet black hair and eyes, and cheeks like twin roses; and a little figure so light and airy, that she might have risen at any moment and gone hovering like a butterfly, without seeming to give anybody reason to be surprised at it. She was one of those laughing and dancing little spirits who are not expected to go sedately, unless she happens to be bred amongst the surliest and unhappiest kind of people. She had a wonderful ear for music and a pretty little voice; and after once hearing any tune that took her fancy, she would go shrilling about with it more like a bird than a child, and every note as clear and true as the song of a thrush.

It happened one day that whilst poor John sat in a retired place watching the tadpoles in a pool, this fairy pipe came tuning down the lane, and the owner of it drew up alongside with a certain fearless way she had, and set her hand on John's shoulder, the better to steady herself to look where he was looking. John put an arm about her waist and drew her towards him, and in a little while the child sat down and sang musically. John said nothing, but he drew her a little closer and kissed her. She kissed him back frankly, and having stayed as long as she felt inclined to stay, released herself, and went rummaging amid the hedges, returning by-and-by with a bouquet which she pressed hot from her own chubby little hand into his. John took it gravely, and looked kindly at her, but still he said nothing.

'You're very quiet,' said Miss Lydia, surveying him with an elderly air—'very quiet.'

'Yes,' said John; 'I'm very quiet.—Will you sing again?'

She stooped to smooth her tiny apron, and then folding her plump small hands behind her, and looking over John's head, she sang a wordless tune, her face mighty serious and business-like, but not in the least shy or bold, her rosy mouth open, and her little milk-teeth gleaming behind them, and her body swaying to the tune. When she had finished, she took the two corners of her apron firmly between the tips of the thumb and finger of either hand and made a courtesy, with her grave gaze diverted from the distance, and set full on John's mild gray eyes. A minute later she was fluttering along the lane again, hovering hither and thither, and singing till her voice died away on the quiet of the fields.

This was their first encounter, though each knew well enough who the other was; but their acquaintance ripened fast, and they became great friends. Many a time that autumn the young Gregg beating about to discover his companion and munching his rations as he went, was guided to him by the sound of the clear little beautiful voice piping in the fields and lanes. In the evenings especially, through August and early September, when the air was warm and the autumn stillness was on everything, he could hear for quite a long distance, and allowing himself to be guided by the sound, he would always find the raven curls somewhere in the neighbourhood of the tow-coloured head of young John, she pretty generally making a breeze about her for the curls to dance in, and he, sitting still and solemn, watching her.

Now the bulldog Gregg was at an age when it comes natural to boys to look upon girls with an extreme and deep-rooted disdain; and if he had made Lydia's acquaintance under other circumstances, he would no doubt have dropped it without loss of time. But seeing that John took pleasure in her society, he condescended from his height of years and sex, and before he knew it, had become the child's bond-slave. She ordered him about as if she had been a little duchess, and he did unquestioningly what she told him, though he was by no means one of the most naturally obedient boys in the world. She on her side waited upon John, and obeyed him as if she had been his spaniel.

John lived in a kind of mental twilight, in which he was happy enough, save when his elders troubled him. Things that came before him naturally, he observed clearly and remembered clearly; but when once he knew that he was expected to master anything, it was all over with his chances of grasping it. The one thing that could quiet little Lydia down from her restless high spirits was a tale; and it was a pretty sight to see when she and John sat side by side, she nestling up to him with her bright eyes wide open and full of wonder, and he with his arm round her like a father or a sweet-heart, spinning her some yarn of his own invention, or thrilling her young soul with the adventures of Uncas and Pathfinder, or making her laugh and clap her hands together with the story of how the old woman got home that night.

William also could spin a yarn; but if he were allowed to tell his story once, it was as much as the imperious Miss Lydia would accord to him. If ever she wanted a second hearing, it was John who was the chosen narrator. Sometimes he would wander from the track, or would bungle the story altogether, and she would set him right again. He had no shyness with these two companions, and the exercises they shared with him did him as much good, perhaps, as he was likely or able to get anywhere just then.

Things went so prosperously with him, that but for the interference of Robert Snelling, his uncle, John might possibly have come round again in a month or two. That interference, which led to grave and even tragic consequences, came about in this way.

The days were beginning to draw in and the nights to grow cold, and John and his repentant

chum spent most of their evenings indoors. On a certain Saturday they were playing draughts together, when the farmer, who had been into town for the market, came home with a brown-paper parcel under his arm. 'Clear away noy, lads,' he said, when he had watched the game to a finish. 'Here's something better than checkers for you.'

They both looked on with interest whilst he laid the brown-paper parcel on the table and unfolded it, with his deliberate heavy fingers fumbling at the string which bound it round, and his kind eyes smiling as he gazed from one eager face to the other. The parcel turned out a splendid puzzle-map of Europe, half as large as the kitchen table, such a toy as no boy of that district had seen the like of till that glorious evening. The two fell upon it with tumultuous joy, and got the Hebrides into the Grecian Archipelago, and fitted bits of the Mediterranean into the Baltic, and corrected one another's errors, and squabbled lovingly over his new treasure, until John grew tired.

The farmer sat in the corner with his pipe and his pewter tankard of home-brewed ale, and looked on well pleased, when on a sudden Uncle Robert walked ponderously in, and nodding a salutation to him, moved over to the table to see what the boys were doing. Vale sat in the firelight with his slippered feet reposing on the steel fender, and the two candles which illuminated the room were on the table at which the lads were seated. The puzzle puzzled Mr Snelling for a while, and he stood silent to examine it. When he had made up his mind about it, he stooped over the table and examined a piece of it by the candlelight, having put on his gold-rimmed spectacles for the purpose. 'Now, John,' he said, drawing magisterially, and straightening himself to his great height, 'where is Calabria?' He had never known the place until that moment, but he looked familiar with it, and the boys thought him learned and terrible. 'Come, come, my lad'—with a pompous and offensive pity. 'Where is Calabria? What is Calabria? Is it a country, a city, a river, a mountain?' Then seeing that neither of the youngsters could answer him, he grew learnedly jocose: 'Is it anything in the inside of a pig, John? Come, come! Calabria?'

John began to turn pale and to fidget with his hands and his jacket buttons. He had been excited, and was easily tired and overwrought. The patronising Snelling frightened him, with his drawl and snap, his ponderous voice and prodigious stature.

'Don't bother the lad, Robert,' said the farmer from his chimney corner. 'It might be the French for a firegrate, for aught I know. Leave the lad alone.'

'Come now,' said Snelling, enlarging himself, though he was big enough in all conscience already. 'Calabria, my lad? Calabria? Where is it? What is it? Town, city, river, sea, mountain, country? What?'

John burst into helpless tears. Young Gregg hated the Colossus already, and his heart was so hot with pity that for a second or two he had wild thoughts of hurling himself against him and going for him tooth and nail. The farmer rose from his chair, and interposed himself

between John and Uncle Robert. 'Leave the lad alone, Robert. He's weakly and tired. He's not fit to be troubled.'

'Weakly?' said Snelling. 'That's no wonder.' He bent a disapproving glance on young Gregg. 'That's what comes of evil companionship; that's what it is to have a roysterer for a companion.'

'Robert,' the farmer interrupted mildly, 'you're too hard upon the lads—too hard on both of 'em.' He bent over John and kissed him with a whispered, 'Be a brave lad, John,' and then stood stroking his hair for a time.—'It was a cruel blow. But never thee cry for it, Will, my lad. 'Twas no fault of thine, any more than mine. It's a sore affliction, but I reckon we can be honest with it.'

'O John, John!' said Snelling, allowing for him in his superior way, 'you're a bit too soft yourself, John.'

'Like enough,' the farmer answered in his gentle way. 'None of us is perfect.'

The truism was mildly advanced, but Snelling seemed to find a personal affront in it. 'Theer's none of us perfect, to be sure,' he said. 'But theer's some of us as is less imperfect than others—thanks be to goodness. I should like to see you stronger, John—resoluter.'

'It's as like as not I might be the better for it,' the farmer replied.—'Will, my lad, John's tired, and had better go to bed. You can run away home now, my lad; and thank you kindly for coming so often. You can come up again o' Monday and have a new play with the map, if you feel that way.'

Snelling had found his way to a cupboard, and from one of its shelves had taken down a box full of long-stemmed clay pipes. He snapped a stem in two at the end of this speech of his cousin's, and threw the useless fragment into the grate with an emphasis which young Gregg felt to be directed injuriously at himself. He disregarded it, however, though he gave himself a combative second or two to think that one of these days he would be grown up and a match for anybody. The boys whispered together for a minute or two, and then William stole out; and John having packed up his puzzle made as if he would go to bed; but his father, stretching out his hand, drew him between his knees and held him there for a time, patting his shoulder now and then.

'I'm—ah—afraid—ah—John,' said Snelling, stooping forward from the chair he had taken, and turning the boy's timid face towards himself with a powerful thumb and finger applied to his chin.—'I'm afraid I put you about a bit just now. I didn't mean it, lad—I didn't mean it.' His manner was unusually hearty and sincere, and John believed in him at once. 'Theer's a bit o' colour coming back,' cried Snelling, pinching lightly the side of John's face which was the nearest to the fire and reflected its clear glow.—'A bit o' colour coming back. Eh? That's right.—And when do you think o' going to school again? Eh? We musn't pass all our young days in idleness, John. We must use up the golden hours. Eh? Youth's the time when learning comes easiest, you know, John.'

'I doubt if he's altogether fit for school as yet, said the farmer.—'What do you say, lad?'

John said nothing; but a kind word had so

much force with him, that he had already obeyed Snelling's hand, and was nestling up to the big waistcoat in a manner altogether confiding and affectionate.

'It's a pity,' Snelling went on, 'as theer's no nearer school than Barfield. It's a big trudge from here to theer, for a lad as happens to be a bit out of sorts.—You'd find the walk too tiring, wouldn't you, John?'

'I should like the walk,' said John; 'but the lessons make my head ache.'

'Ah!' replied Snelling. 'De they, now? We must tackle 'em bit by bit, John. Here a little and theer a little.' He was very kindly and considerate now, and John was altogether reconciled to him. Snelling sat staring at the fire with his big hand still on John's shoulder, when a knock came to the door.

'That'll be Isaiah,' said the Colossus, turning round. 'I told him if he'd call here I'd give him a lift home.'

The farmer cried, 'Come in;' and the man who had knocked, entered, and taking off his hat with both hands, as if it were a great weight, lowered it slowly and held it before him. 'Shut the door, and take a seat, Isaiah,' said the farmer. 'How are you?'

'I'm pretty middling, gaffer,' responded Isaiah, seating himself in a comfortless fashion, and placing his hat between his feet. 'Nothing to complain about in particular, but nothing to brag about either.'

Isaiah was a man of a hard and shiny complexion like that of a wax-apple. He was bald to the nape of the neck, and a stubbly collar of gray beard ran round his throat from one ear to the other.

'You'll take a glass of ale, Isaiah?' asked the farmer.

'Well, gaffer,' Isaiah answered in a non-committal manner, 'I won't say I won't.'

This being accepted as an affirmative, the newcomer was supplied. He accepted the tumbler, and throwing back his head, poured the ale into his mouth with as much sign of satisfaction as if he had poured it into a cask.

'I'll tell you how it might be managed, John,' said Snelling, renewing the conversation. 'He might come and stay a time with me. Then he'd be nice and handy to the school, and he might work half-tides there. Mrs Winter 'ud take good care of him, and he might go to school of a morn'ing. It's a pity to see a bright lad wasting the best hours of his youth.'

John Vale the elder looked at John Vale the younger, as if to ask his mind about the matter. Uncle Snelling drew the boy a little closer to his enormous waistcoat and made much of him.

'What do you think, John?' asked the father. 'Would you like to go and stay at your uncle's for a bit?'

'He'd get no harm theer,' said Snelling. 'Isaiah is a God-fearing man, and very proper in his walk and conversation.'

'I shan't do the boy any harm,' said Isaiah, who seemed to have followed the drift of the speakers.

'No, no, Isaiah,' the farmer answered; 'I'm not afraid of that. I shall find it a bit lonesome myself, I reckon.—I take it kindly, Robert; but you've got no children of your own, and a lad about the heuse might put you about.' He

sighed, and tapped the ashes from his pipe on one of the topmost coals of the fire. 'We'll think it over,' he said then, 'me and John together.'

Snelling seemed to think this equal to a refusal. 'It's theer,' he said, 'to take it or leave it, as you and John see fit.'

'Father,' said the boy.

'Well, my lad?'

'I think I should like to go to Barfield.'

'That's a lad!' cried Uncle Snelling.

IRON IN ITS RELATION TO LIFE.

It is not generally known that iron has such an important and indispensable function to fulfil in the maintenance of animal life that no work of the body, voluntary or involuntary, muscular or mental, can be performed but by its agency. And still less is it known that iron is equally as necessary to the support of plant-life and to plant-growth. And yet these are facts—two of the many unexpected ones revealed to us, in these days of scientific research, by the combined aid of the microscope and chemistry; and which illustrate to us how the commonest materials of the mineral world are laid under contribution for our very existence as living beings, as well as for our daily uses in the various arts of social life.

In order to understand the relationship of iron to animal vitality and energy, it will be necessary briefly to consider how the work of the body, internal and external, is performed. First of all, then, we get an idea of the total work done by the body by simply remembering the fact that an average man engaged in labour, in the course of twenty-four hours does work equivalent to lifting a ton to the height of four hundred and fifty feet; and of the internal work, by considering that the heart alone in pumping the blood to all parts of the body performs in the same time work equivalent to raising a ton one hundred and twenty feet high, to say nothing of the work of respiration, &c. Now, the source of all this energy—a great part of which is actually necessary in order that the body may simply live from moment to moment—is *heat*. Yes, heat is the mechanical force in the animal as much as it is in the steam-engine; and this bodily heat is generated by the combustion of the carbonaceous matter of which our food and bodies mainly consist, just as the heat of the steam-engine is derived from the burning of the coal. This slower burning going on constantly in the animal body, is taking place in every minute corner of the system to which the blood flows, and imparts to the blood its well-known heat (about one hundred degrees Fahrenheit). This combustion is known in chemistry as oxidation, because it is really the union of the oxygen gas inhaled from the atmosphere in breathing, atom to atom with the carbon and hydrogen of the food and worn-out particles of the body. Here again our illustration of the steam-engine

holds good; for the combustion that takes place in its furnace is similarly the combining of the carbon and hydrogen of the coal with the oxygen of the air. Whenever oxidation occurs, heat is produced by the violence of the impact of the atoms of the uniting substances in their attraction for each other; or, as the chemists say, by the force of chemical affinity. Oxidation may be so slow that the evolved heat, as produced little by little, may be insensibly small; or it may be so rapid as to generate at once sufficient heat to produce ignition.

At each inspiration, the lungs are filled with air, a portion of which consists of the life-sustaining gas, oxygen. Then through the membranous walls of the air-cells, which are surrounded with minute blood-vessels, an interchange of gases takes place, oxygen from the air-cells going through into the blood, while water-vapour and the poisonous carbonic acid gas pass from the blood into the air-cells, and are discharged into the outer air in the process of expiration. These latter—water-vapour and carbonic acid—are respectively the products of the chemical combination of oxygen with hydrogen and carbon previously stated as taking place in all parts of the body. But now comes the question: how is it that oxygen gas, which is only soluble in water or the watery portion of the blood to an inappreciable small extent, is actually absorbed into the blood in considerable quantity for this work of oxidation?

If a drop of blood be viewed under the microscope, it is at once seen to consist of a colourless serum, in which are floating a multitude of coloured, round, flattened bodies. These are the red corpuscles, which give to blood its redness, and whose special work it is to absorb the oxygen and carry it to all parts of the body in the course of its circulation. If blood be streaked on a white surface, it will be seen that the colour of these corpuscles is deep orange rather than crimson; and it has been computed that there would be several millions of them contained in a thin film of blood sufficient to cover a square inch of glass. The colouring matter of the corpuscles can be separated from the other portion, and when burned, is remarkable for yielding the extraordinarily large proportion of twelve per cent. of peroxide of iron (iron rust). In fact it may be said that all the iron in the blood is contained in the red corpuscles. Now it is well known that peroxide of iron not only gives to many soils their characteristic redness or brownish redness, but also their great absorptive power for such fertilising gases as ammonia; and also that it is much used in the arts specially as an absorbent, as, for instance, in the manufacture of coal-gas, where it has almost superseded the use of slaked lime for the purpose of absorbing the sulphuretted hydrogen gas and other impurities. And for this particular purpose it may be used over and over again, as it readily parts

with the absorbed gases on exposure in thin layers to the air.

Here, then, we get a clue to the special function of iron in the red corpuscles of the blood; it enables them to readily absorb oxygen as they pass along the minute blood-vessels of the lungs, and to act as carriers of this all-important gas to all parts of the body, parting with it freely for the work of oxidation as required. Little wonder, also, that iron is found to be a valuable tonic medicine in cases of debility arising from poorness of blood, for exercise in the fresh air—which, of course implies rapid inspiration of oxygen—can only be of greatest benefit when the supply of iron in the corpuscles is at its maximum.

Again, the blood as it comes to the lungs from the heart for aeration is dark, but the absorption of oxygen restores its brightness, and it returns to the heart in all its proverbial redness. Similarly, if a drop of dark blood from the vein of an animal be exposed to the air, it at once becomes scarlet; and reddish brown is characteristic of that class of iron compounds which are related to the peroxide of iron. Further, although the deadly carbonic acid gas which is exhaled from the lungs, unlike oxygen, is very soluble in the watery portion of the blood, yet it is probable that as fast as the absorptive iron of the corpuscles parts with its oxygen in the minutest blood-vessels of the body, it absorbs an equivalent portion of the waste carbonic acid gas, and that this is the carbonic acid which is discharged from the lungs in the process of respiration; for if blood be alternately shaken up with oxygen and carbonic acid, it alternately becomes crimson and dark. If this, then, be the function of iron in the blood, it is impossible to exaggerate its importance; for it is nothing less than the ingredient which enables the corpuscles to absorb and carry the oxygen to all parts of the animal system, to support the combustion that generates the heat, which is the force initiating breathing, blood-circulation, and all forms of vital action.

In the next place, we have to consider iron as an essential element in plant-life and growth; and in order to come to a clear conclusion concerning it, it will be necessary to notice some of the vital processes in the development of a plant, and more especially as to the office of its leaves. At the outset we shall see some analogy between the lungs of an animal and the leaves of a plant; for as the lung is the organ for taking in from the air and expelling from the body certain gases for the maintenance of the animal's life, so the leaf absorbs from the air and gives off from the plant certain gases for the support and development of the plant. But here our analogy ends, the inhaled gases being totally different, and the purposes for which they are inhaled being totally different also. For while the animal takes in oxygen to generate internal animal heat, the plant, under the influence of the external heat and light of the sun, absorbs through its leaves the poisonous carbonic acid exhaled by the animal, not for internal food-burning, but for *actual* food; for the charcoal (carbon) of which about half the dry weight of a plant consists is the carbon constituent of the carbonic acid gas absorbed by the leaves; the oxygen constituent being at the same time set free again

for animal use. And here, in passing, one is struck with one of those transcendently beautiful arrangements in nature which meet its students at every turn—namely, animal refuse and poison becoming plant-food; the plant the purifier and replenisher of the air for the animal; the plant again organising the poison into wholesome food for the animal; and the plant utilising external solar heat to produce carbonaceous food or fuel for the future generation of the internal heat of the animal.

The chief gas exuded from the leaf-pores is water-vapour, and the amount given off, especially in hot weather, is very large; and this is the main cause of the rise, by capillary attraction, of the sap, just as lamp-oil rises up the wick to supply the place of that which is being burned away at the top. And the chief gas absorbed by the leaves through their pores is the carbonic acid already mentioned; but this absorption can only go on under the influence of sunlight and in the presence of the green colouring matter of the leaves. This green colouring matter, or chlorophyll as it is called, exists in minute grains in certain of the minute leaf-cells. Here in these cells the carbon and oxygen of the absorbed carbonic acid are made, in some way or other, through the agency of these chlorophyll grains, to part company; the carbon at once combining with the elements of the water brought up from the soil to form at first sugar, and ultimately, by further chemical changes and combinations with the substances brought up from the soil, starch, woody-fibre, acids, salts, oils, and the flesh-forming substances of which plants consist.

Now maize, oats, and many other plants have been very successfully grown and brought to perfection in bottles containing water in which have been dissolved all the substances that plants are known to require from the soil, one of which is iron. But if a solution be made absolutely free from iron, but containing all the other essential substances, a curious occurrence ensues—the leaves begin to lose their greenness, and at length become white, growth ceases, and after lingering for a time, the plant dies of starvation, not being able to assimilate its air-food—carbon. If, however, before this climax is reached, one single drop of solution of an iron salt be added to the bottle, the greenness reappears in something like twenty-four hours and growth proceeds as usual. Hence it is clear that the slightest trace of iron is sufficient, but at the same time *some* is absolutely essential for the formation of chlorophyll. It is as if the chemist (chlorophyll) were absent from his laboratory (the leaf), though all the chemicals are there as usual; and consequently work there is at a standstill, and will remain so until his friend (iron) stimulate him to fresh exertions. Curiously enough, chlorophyll is not known to contain iron, though it may be present in too infinitesimal a quantity to be easily detected; but that it is necessary to the production of chlorophyll there can be no doubt. It is also curious that just as there is a class of iron compounds of a reddish brown colour, so there is also another class of a green colour, a well-known member of which is green vitriol (protosulphate of iron).

It is at least an interesting coincidence that iron should be the active agent in both animal and vegetable life for the assimilation of the air sub-

stances required for their existence; and that at the same time it should be intimately connected with the production of the distinctive colour of the blood and of the foliage of plants.

JEREMY YORK.

III.

BEACH STREET was in those days much as it is now, the quaintest, saltiest, imaginable thoroughfare on the coast of Great Britain; littered with anchors of all sizes, with huge coils of hemp cable, with odd fantastic capstans for the winding-up of boats, with tall poles for the spreading of nets, lines from window to window for the easy drying of linen, queer dusky alleys leading at night-time into a true smuggling blackness of atmosphere; beerhouse after beerhouse in friendly juxtaposition, with a perpetual seething and hissing of surf upon the steep shingle, as a regale to the ear, and miles of sand plains beyond billowing to Sandwich, and sweet and musical into late autumn daytime with wild-flowers of fifty different sorts and birds of all kinds.

It was now about nine o'clock in the evening; there was no moon, the starlight made no sheen, and the sea brimmed in tremorless ebony to its confines. The few oil lamps in Beach Street threw a feeble gleam upon the shingly road; but how full of people Deal was on this particular night, York might have gathered from the groups of men showing through every tavern window he passed; drinking, arguing, singing, caper-cutting, as Jack will when newly come ashore, amid motionless fogs of tobacco-smoke. The first sign his eye caught was that of the *Kentish Sickle*. He entered the place, and found it crowded with boatmen and seamen. The landlord, a purple-faced man, who had removed his wig for air, and yet looked half dead with heat, stood behind a little bar or counter drawing ale out of a cask, the top of which was on a level with his hand. York inquired if he could have a bed; the landlord shook his head, with a glance at the tall youth, as though he suspected a kind of impertinence in such a question in the face of the crowd of people smoking and drinking beyond.

'Can you name me a house in which I'm likely to obtain a bed for the night?' said York.

'No,' said the purple-faced man, continuing to draw ale into thick glass, one-legged tinublers, which, as fast as he filled them, he pushed to a couple of fellows, who carried them to the tables. 'It'll be odd if ye gets a bed to loie in to-night, mate, in Deal. Whoy, it'll be ending in the boatmen having to turn their boats' keel up for lodgings;' at which observation a large heavy man, in a round hat and a great belt round his waist, fit for the snugging of a horse-pistol or two, burst into a loud laugh.

York walked out, and entered another tavern hard by. This, too, was full, its five bedrooms crammed, the state-bed of the place to be occupied by no fewer than four men, to lie heel to heel, whenever it should suit them to withdraw to it; as the perspiring, dried-up little landlord informed York with a grin of exquisite satisfaction.

He tried a third, a fourth; tramped on to the *Cat o' Nine Tails* alehouse; but to no purpose. Had every house had its forty beds to let, they

would not have apparently met the demand that night for accommodation from the captains, mates, passengers, sailors who had come ashore on special business, or who had deserted, or who had to take the coach next day to London or wherever they might live, counting (as passengers) upon days and perhaps weeks of detention if they stuck to the craft lying out in the Downs yonder.

York had now reached the Sandown extremity of Deal; he retraced his steps, and passing the houses he had visited, he arrived at much such another one as they, called the *Lonely Star*, into which he walked. At the end of a tolerably long narrow passage was an open door, out of which floated clouds of tobacco-smoke along with the incense of the punch-bowl. A little on this side the door was a staircase, and nearer yet to the entrance a recess, in which sat a plump woman of fifty, with sloe-black eyes and red cheeks and treble chins. Over her head hung an old-fashioned lantern, the light of which was comfortably reflected in rows of bottles on shelves behind her filled with liquors of various dyes.

'Can I have a bed in this house?' asked York of this plump, good-humoured woman, who at his approach let fall some knitting she was at work upon.

She ran her bright black eyes over him with an expression as though she found pleasure in the sight of his long womanly hair and pale handsome face and manliness of stature, and answered after a minute's thinking: 'I'm afraid not, sir. Every bed in the house is taken. I never remember Deal so full of strangers.'

'I shall have to return to the ship, then,' he exclaimed. 'Yet I would rather not. Plying betwixt the Downs and the shore is costly work to a poor man—at least your boatmen make it so. A spare sofa would serve me. I have been ill in South America, and am not yet well, and durst not lie in the open. A pillow and a roof for my head would suffice. I must be up by daybreak, perhaps before. My sweetheart's mother, Mrs Bax, lives t'other side of Sandwich, more Minster-way than that town.—D'ye know her, ma'am?'

'By name, sir: a very decent good lady, I'm sure.'

'There's a bed for me there; but it's too far to reach it on foot to-night. Besides, my sweetheart, Jenny, will not expect me till to-morrow by noon, or thereabouts. Now, what am I to do for a bed? There will be other houses of entertainment in this town besides those I have visited in this street?'

'There's a gentleman,' said the landlady, after a short spell of thought, 'lying up-stairs who has used my house for some years running. 'Tis but a bit of a room he's in, sir; but he rests in a great big bed, broad enough to house a large family. If you wouldn't mind sharing it with him, he'd accommodate you at my request, I don't doubt. What do you say?'

'You are very good, ma'am; 'twould be a god-send, I assure you. I could not feel more weary had I been tramping Deal all day.'

'Step into the end room, then,' said she, 'and call for what you will whilst I find out if the gentleman will receive you.'

He entered, and found himself in the company of some score and a half of seamen of all denominations, with a sprinkling of soldiers and a few

women. The room was unpleasantly full; the height of it was no taller than a small ship's 'tween-decks, and it had something of the look of a 'tween-decks, with its substantial joists or rafters, its small porthole-like windows, and walls resembling bulkheads. A few of the nearer folks stared at him on his entrance, and a couple of the women giggled a bit at his hair; but the company were on the whole rather too drunk to give him much heed. It was an old-world scene that, for its utterly vanished qualities of colour, atmosphere, attire, is scarcely imaginable in these days; unsmuffed rushlights flaring on the tall, narrow chimney-piece and on the tables; men mahogany-cheeked with weather, some wearing their own hair in tails, some with wigs, with here a three-cornered hat cocked over its owner's nose, there a round tarpaulin perched on nine hairs; with a fathom of ribbon down the back; and most of the people smoking long clay pipes, and arguing with drunken animation, with now and again the added hullabaloo of one who would set up his throat for a song; the women in colours which made one think of a crockery shepherdess; and visions of copper-nosed salts looming out in postures of wrangling at the tables in smoke-obscured corners.

York took a chair near the door and called to the drawer for a glass of spirits. After a little the landlady came to him and said that she had knocked at Mr Workso's door and asked if he would object to a bedfellow; and that his answer was the gentleman was welcome if so be he would contrive to ride with an up-and-down cable; by which she understood Mr Workso to mean that he expected the gentleman to keep to his side of the bed. York thanked her, and said he should be glad to go to rest at once.

'I shall be quitting your house before you're up,' said he, 'and will pay you for the bed now, if you please.'

'As you will, sir,' said she: 'it will be a shilling.'

He gave her the money.

'There will be no difficulty,' he exclaimed, 'in letting myself out in the morning? I do not wish to disturb the house by a stiff wrestle with harsh bolts and difficult locks.'

'That'll be your door, sir,' said she, pointing to the street entrance at the end of the passage. 'There is but one bolt, and it shoots easily. We fear nothing but the foreign invader at Deal, sir. The latch will fall when you pull the door after you.'

He thanked her, took his bundle, and followed her up-stairs. She knocked at a little door painted stone-colour, leaning as with age in its frame. A voice answered, 'Come in,' in a muffled hurricane note.

'It's the gent, Mr Workso, as is to lie with you,' responded the landlady; and then, putting the rushlight into York's hand, she bid him good-night with a pleasant wish that he would find his sweetheart happy and in gay health next morning.

The latch of the door appeared to be jammed; York struggled with it for some time, but could not succeed in lifting it. Meanwhile, he heard Mr Workso, who was manifestly a seafaring man, calling from the bed several varieties of sea-blessings upon the eyes and limbs of his

disturber, until, losing all patience, he bawled out in the tones of a gale of wind: 'Put your shoulder to the latch and heave it up! Thunder and blood! ain't it plain that prising's your only tack?'

York did as he was told, and by so doing lifted the crazy old door off its latch, and entered.

He found himself in a little room, with the ceiling but a very few inches above his head. The apartment was almost entirely filled by a large, black, funereal four-poster, undraped, and furnished with a perfect Atlantic Ocean of blanket, mattress, and coverlet. On the left side of this immense bed lay a man, of whom nothing more was visible than a curiously elongated face, as though his countenance had been stretched, lengthening the lineaments out of all proportion to their breadth. This odd face was crowned with a large red handkerchief, so twisted over the head as to serve as a nightcap. The clothes of a nautical man of that age lay heaped upon a chair under the very little window which gave light and ventilation to the room.

'Sorry to break in upon your rest, Mr Worksop,' exclaimed York; 'but needs must, you know.—But for your kindness, my bed to-night might have been on the cold ground, I fear.—Deal's amazingly full, certainly.'

'Very welcome, very welcome,' growled Mr Worksop in a somewhat softened voice, staring over the edge of the bedclothes with small, windy, deerset eyes at the long hair and tall figure of the young fellow. 'There's room enough; only be so good as to bear a hand and tumble aboard, for I don't feel up to the knocker to-night, and there's been row enough going on down-stairs since I've him here to make a dead man get up and shoulder his coffin for a cruise arter peace.'

York fell to undressing as expeditiously as possible.

'What's your calling, may I ask?' inquired Mr Worksop, rumbling out the question with his mouth half covered with the bedclothes.

'A sailor,' was the answer.

'What ship, sir?'

'Well, I was second-mate of the *Celia*, but sickened at Valparaiso of some pestilence there, and was left behind by the master. I was down six months with the malady, and nearly a dead man. Then the captain of the brig *Jane* offered to carry me home on condition of my helping him in the navigation of the vessel—I mean, taking observations and keeping the reckoning and the like; for he had lost his chief-mate; and his second, who was the ship's carpenter, couldn't read or write. We brought up in the Downs this evening; and as my sweetheart lives within a few hours' walk of this place, I came ashore, meaning to start for her home at dawn to-morrow. Small chance of my disturbing you, Mr Worksop; you'll find me cat-like, and won't know I'm gone till you turn to look.'

'Right you are, sir; right you are,' rumbled the other: 'there's room enough here. Why, boil me alive, oh! but this must have been a royal bed of state in its day.'

'I'll blow out this light,' said York.—'But have you a tinder-box handy, Mr Worksop? I'm without that convenience—without a good deal that should have been mine but for Valparaiso. It's

well to be able to strike a light; one never knows what may happen.'

'There's my jacket on that cheer,' answered Mr Worksop; 'you'll find what you want in the left-hand pocket.'

York felt, and found the things, placed them near the rushlight, extinguished it, and got into bed.

They lay talking for a while. Mr Worksop, it seems, had been boatswain of a West Indianman for three voyages. He had been paid off in London a week or two before; and having been born at Deal, had run down to spend a few days at the old spot and to take a short cruise about the district. He was too sleepy to talk much; but it was plain, from the little he let fall, that he was a man who had used the ocean for many years, and had much that was moving and interesting to tell, whenever he should feel disposed to deliver himself of his experiences. Presently he began to wander, then to snore. York lay awake for some time, listening to the hum and roll of the voices of the drinkers in the room below. There was an oil lamp just outside the window, which threw a dim illumination sufficiently clear to render faintly visible the outlines of objects. The young fellow rested, lost in thought, with his mind going to his sweetheart, from whom he had been parted fourteen months; then to his prospects in life; the offer made him by the captain of the *Jane*, his chances of getting the money due to him from the owners of the *Celia*, and the like; and then the noises below quieting with the departure one by one of the revellers, he closed his eyes and was presently asleep.

He was awakened by a sense of suffocation, and found himself bathed in perspiration and panting for breath under the weight of the bedclothes. The boatswain was snoring heavily. All was silent out of doors, saving at intervals the moan of a gentle gust of wind, like a long human sigh, running through the stealthy seething sound of the midnight waters pouring upon the shingle. He sat upright for the relief of the posture; but whether it was that the Valparaiso fever was not yet out of him, or that his condition rendered him particularly sensitive to atmospheric conditions, he found the temperature of the room insupportable. Indeed, the little compartment was nearly all bedstead. The lungs of the boatswain, to judge by his breathing, seemed to require the air of the open ocean to fill them. There was an odour of flue, too, along with a tepid flavour of bedclothes, that was as stifling in its way as the atmosphere of a bakehouse.

The young fellow quietly got out of bed with the design of opening the window, but found the casement, as the door had been, a sort of fixture, whose dislocation must result in the waking of the whole house. He pined for a drink of water; but there was no jug or washing apparatus in the room, and it was manifest that gentlemen who put up at the *Lonely Star* were to expect no better convenience than an outdoor pump for their ablutions. Now, the *Lonely Star* was sure to have a pump of its own as well as a backyard; and the fancy of a drink of cold water coupled with a short spell of breathing the dewy night-air worked so irresistibly in the feverish young man, that he resolved at all hazards to explore for the

relief he panted for. He put before his fancy a figure of the house, and kept in his mind the bearings of the staircase and the public room he had entered. He could recall that, whilst seated in that room, he had taken notice of a glass door screened with red curtains at the extremity of it, with a white step between it and the floor. This he made sure led into the back-yard, where, though he should not meet with a pump, he was certain to obtain fresh air.

He partially clothed himself; but, on trying the door, found he could not lift the latch with his fingers. He felt in his pockets, but was without anything to enable him to prise open the jammed and rusty arrangement. The boatswain snored heavily in the soundest sleep. York, dreading the fellow's temper should he awaken him, walked softly to the man's clothes, and, by the feeble light that shone upon the little window, groped in the pockets for any contrivance that should serve him as a lever. The jacket pockets contained nothing but a tobacco-case, a pipe, and some papers. He felt in the left-hand breeches pocket, and touched a quantity of pieces of money, the weight of which proved them to be gold, apparently guineas and half-guineas. In the other pocket was a large clasp-knife such as sailors carry, with a ring through the end of the haft for a laniard.

York took his knife, went to the door, and succeeded in lifting the latch; and this done, he stole forth, leaving the door ajar; then putting the knife in his pocket, he groped his way down-stairs all very quietly, as he did not wish to disturb the house. The street lamp that had helped him in the bedroom served him below wherever there was a seaward-facing window, and he made his way without difficulty through the long, low-ceiled public room, reeking and sickening with the lingering fumes of tobacco and rum punch; and pulling back the single bolt of the glass door he had taken notice of, he found himself in a little back-yard with, sure enough, the outline of a pump in the corner faintly touched by the starlight.

He drank and bathed his hands and face, and felt himself greatly refreshed. There was an inverted tub close to the pump, upon which he rested himself, and here he continued to linger for some time, reluctant to quit the sweetness and freshness of the cool air that was breathing direct from the sea for the oven-like oppressiveness of the little bedroom. Maybe he dozed, for he was suddenly startled by the near drowsy voice of a watchman calling the hour, two o'clock. On hearing this, he arose, re-entered the house, quietly bolted the glass door after him and returned to his bedroom.

IV.

The name of the landlady with the apple-red cheeks and array of white chins was Mrs Mate, and this good woman had received instructions from Mr Workosop the boatswain, from the first day on which he had arrived, to call him every morning whilst he slept at her house at seven o'clock, neither sooner nor later; and to have his breakfast of small-beer, rashers of ham, cheese, red herrings, and brown bread ready for him in the little front parlour down-stairs punctually by

a quarter to eight. Mrs Mate was always careful to humour such sailors as stayed at her house with money in their pockets. Mr Workosop had now used the *Lonely Star* for five days continuously, not to speak of his being a regular customer whenever in those parts; and in those five days he had spent his money handsomely, begrudging himself nothing, tipping with a quarter-deck rather than a fore-castle taste, and there was good prospect of his remaining in the house until the following Wednesday.

When next morning came, then, exactly at the hour of seven, Mrs Mate went up the somewhat darksome staircase that led to the chamber in which Mr York and Mr Workosop had slept, and knocked at the door. She received no answer. She was not surprised, for Mr Workosop was a stout sleeper, apart from his trick of going to bed with his skinfull. She knocked again, and yet again, accompanying her blows by a vigorous kicking; and failing to receive any sort of reply, she lifted the latch of the door—understanding, of course, as the landlady of the house, the trick of opening it—and walked in.

It was broad sunny daylight outside, but the little window set close under the ceiling admitted but a pitiful light. However, at one glance Mrs Mate was able to see that the bed was empty. She was prepared to find the boatswain alone, knowing, as we have seen, that Mr York meant to start for his sweetheart at daybreak; but on glancing around she observed that not only was Mr Workosop gone but his clothes likewise. This was unusual. She stepped to the bed, and more through habit, perhaps, than with design, she pulled down the bedclothes, which lay somewhat in a huddle on the side the boatswain had occupied, and instantly uttered a loud squeal of fear and horror.

There was a great stain of blood upon the sheet, with smaller stains round about it, that seemed to be sifting out even as she watched them like a newly dropped blob of ink upon blotting-paper. Mrs Mate squealed out a second time even more loudly than before, following the outcry by an hysterical shriek of 'Murder! murder!' meanwhile noting, with eyes enlarged to twice their circumference by fright, that there was a pool of blood on the floor on the side where the boatswain had lain, with other marks which vanished at the door.

So shrill-voiced a woman as Mrs Mate could not squeal twice at the top of her pipes and yell 'Murder! murder!' also without exciting alarm. The first to rush up-stairs was her husband, an old man in a white nightcap, an aged frill-shirt, and a pair of plum-coloured breeches. He was followed by the drawer, by a couple of wenches who had been busy cleaning rooms down-stairs, and by five or six sailors, who came running out of the adjacent bedrooms on hearing Mrs Mate's cries. Grasping her husband by the back of his neck, the landlady pointed to the bed, and exclaimed: 'Mr Workosop has been murdered! murdered, Joe, I tell you! Blood in our house! Murder done in the *Lonely Star*!'—uttering which, she fell upon the floor in a swoon, but contrived to rally before her husband scented able to grasp the meaning of what she had said.

One of the two wenches instantly slipped away to give the news. 'A cold-blooded murder was go

common occurrence in Deal. A 'Customs' man found dead with a slug through his heart, the body of a smuggler washing ashore with a ghastly cutlass wound upon his head, the corpse of a gagged 'blockader' at the foot of the Foreland Height, were mere business details, necessary items of a programme that was full of death, hard weather, miraculous escapes, murderous conflicts; but a cool midnight assassination was a genuine novelty in its way, and in a very few minutes, thanks to the serving-maid, the pavements outside the inn, the passage, the staircase, the tragic bedroom itself, were crowded with hustling men and women, eagerly talking, the hinder ones bawling to those ahead for news, and the whole rickety place threatening to topple down with the weight of so many people.

The story soon gathered a collected form. It was known that about nine o'clock on the previous evening a tall young fellow with his hair curling upon his back had applied at the *Lovely Star* for a bedroom, and was admitted by consent of Mr Workop to a share of the great bed in which that worthy lay. It got to be known, too, in a wonderfully short space of time that Mr Workop carried in his breeches' or other pockets some thirty or forty guineas and half-guineas loose, a handful of which he had exhibited with uncommon satisfaction on several occasions when overtaken in liquor. It also got to be known in an also equally incredibly short space of time, thanks to one of the watermen who had rowed Mr York ashore from the brig *Jane*, that the tall young man with the long hair had owned himself worth only half a guinea, of which he had given four shillings to the boatmen after a tedious dispute, one to the landlady for his bed, and a sixpenny bit for liquor, leaving him with five shillings—all the money he had in the world, according to his own admission; 'and quite enough,' exclaimed a deep voice amidst the jostle of men on the staircase, 'to account for this here murder.'

Presently, there was a cry of 'Room for Mr Jawker!' The crowd made a lane, and there entered a round, fat, fussy little justice of the peace, with the only constable that Deal possessed—a tall, gaunt, powerfully built, though knock-kneed man, in a rusty three-cornered hat, and a long stick—following close at his heels. Little Mr Jawker approached the side of the bed, and after taking a long look, full of knowingness, at the blood-stains, he ordered the constable, giving him the name of Budd, to clear the room of all save those who could throw light upon this matter. This being done, Mr Jawker fell to questioning the assembled folks, and bit by bit gathered as much of the story as they could relate. The landlady, Mrs Mate, was ignorant of the name of the tall young man with the long hair; but he told her, she informed his Worship, that he meant to leave her house before daybreak that morning, to be in time to breakfast with his sweetheart, who lived, Sandwich way, and who was none other, as she supposed, than pretty little Jenny Bax, for 'twas the widow Bax's name he mentioned when he spoke of walking over to his love at dawn.

At this point there was a disturbance outside. Budd the constable looked out, and presently looked in again to inform Mr Jawker that fresh

prints of bloodstains had been discovered on the pavement, and could be traced some distance.

'They must be followed! They must be followed!' cried little Mr Jawker; 'they may lead us to this discovery of the body of the murdered man.—Follow me, Budd!' with which he went down-stairs, the gaunt immense constable close behind him, and the people shouldering one another in pursuit of both.

There was a great crowd outside. Deal was but a little place in those days; indeed, it is but a little place now, and the news of the murder—if murder it were—had spread with something of the rapidity of the sound of a gun. It was a sparkling morning, a small westerly draught rippling the sea into the flashing of diamonds under the soaring sun, the Downs filled with ships as on the previous day, the white front of the Foreland gleaming like silk upon the soft liquid azure past it, with, noblest sight of all, the line-of-battle ship, the central feature of the mass of craft, in the act of tripping her anchor and flashing into a broad surface of canvas with her long bowsprit and jib-booms to head to the north and east presently for a cruise as far as Heligoland.

The instant the little justice of the peace made his appearance there arose a stormy hubbub of voices of men eager to point out the bloodstains. It was a tragedy that went too deep for merriment, yet one might have laughed at the eager postures of square-sterned boatmen bending in all directions in search of new links of the crimson chain of crime, as though a vessel full of treasure had gone to pieces close aboard the land on top of a furious inshore gale, and there were ducats and doubloons and pieces-of-eight in plenty to be found at the cost of a hunt amongst the shingle. So many inquiring eyes were sure to discover what was wanted. Stains unmistakably of blood could be followed at varying intervals from the pavement in front of the *Lovely Star*; then into the middle of Beach Street; then an ugly patch, as though the burden of the body had proved too heavy, and the bearer had paused to rest; afterwards, for a hundred paces, no sign; then half a score more of stains, that conducted the explorers to the timber extension that projected a little distance into the sea, and there of course the trail ended. Nothing could be more damning in the theory they suggested than these links of blood, starting from the bedside, and terminating, so to speak, at the very wash of the water. It was universally concluded that the tall young man with the long hair, name unknown, who had slept with Mr Workop, had murdered that unfortunate boatswain for the sake of the guineas in his pocket; and under cover of the darkness of the night, had stealthily borne the corpse to the timber extension and cast it into the sea.

Mr Jawker started off at a rapid pace, followed by the constable, to make out a warrant for the apprehension of the tall young man with the long hair for wilful murder; whilst a number of boatmen went to work with creeps or drags to search for the body in the vicinity of the beach; but though they persevered in their efforts till noon, watched by hundreds of people ashore as well as by the innumerable ships' crews who crowded the shrouds and tops to observe the

result of this patient dredging, nothing more than a very old anchor, which was supposed to have belonged to one of Tromp's ships, was brought to light.

OUR SPIRES AND SPIRELETS.

THE closer we look at our ancient churches the more ready we shall be to admit our predecessors did their best, in most instances, to hand down to us work that should be worth looking at. As we examine them, too, we must own much obligation to Time and Weather: for those inscrutable artists, following in the wake of the old Norman and Plantagenet masons, have softened the edges of the stonework, endued it with dove-like tones, enriching it besides with countless discs of sea-white, sea-green, and tawny-amber lichens no other craftsmen could design. The merit of these legacies from the past is perhaps most apparent when we look up to the lovely spires and spirelets left us in such abundance. These lift up their heads with a dignity and appealing earnestness which only good work suggests, and have charms that only centuries and sunshine can bestow.

Our most beautiful spire is that of Salisbury Cathedral. It rises to a height of four hundred feet from the pavement within the building. Midway in the splendid vista of clustered columns and graceful arches and shadowy aisles of the interior rise four mighty piers, over which is a stone-vaulted roof. On this open substructure is built a slender square tower of three tall stages, very light, yet rich with arcadings; and from the topmost of these rises the octagonal tapering spire with its capstone, and its banner-like vane, dated 1675, above it, and its metal cross above all. At each edge of the slanting stonework is a line of bead-like enrichment, and three times in the course of its height a wide band of quatrefoiled ornament encircles the spire. At its base on the top of the highest stage of the tower is a richly wrought open-work parapet, with a spirelet at each angle. It is, of course, hollow, except for a stalwart framework of timber in twelve diminishing stages on which the stonework is laid. When we realise the extent of the labour required to raise all the stones to their high places, of the skill for their adjustment, and of the necessary precautions in the way of supports, bandages, and braces to receive and sustain the vast weight at its enormous height, we may indeed agree that it is a wonderful work. Sir Christopher Wren was called in as an expert to examine its condition in 1668. He mentions with admiration the circumstance that its height corresponds with the length of the edifice, and adds that, though it is a hundred and fifty feet high in itself, without counting the height of the tall tower on which it is raised, it is but nine inches thick. His impression was that the original architect intended to 'conclude' the tower without a spire, and that it must have been a successor who tied the walls together with the immense iron braces and straps

now to be seen in them, and ventured to add the marvellous needle.

It is not unusual for spires to be after-thoughts. The spire of Shakespeare's church, or, more exactly, of Holy Trinity Church, Stratford-on-Avon, is a case in point. This church is a very ancient edifice, probably dating from Saxon times, and certainly containing fragments of Norman work. It is cruciform in plan, and from the intersection of the transepts with the nave and chancel rises a strong tower, which was evidently originally 'concluded' without a spire. In the course of centuries, various portions of the fabric have been rebuilt, and the work of the first builders taken down. There remains to us a large edifice chiefly of Perpendicular architecture with spacious mullioned windows and battlemented parapets. Tapering up from the centre of the top of the tower in the last century was a short stout spire on a timber framework covered with lead. This was eventually considered of inadequate importance, and was replaced in 1763 by the very tall, thin, unbranched 'extinguisher' we now see. The grave old tower is eighty feet high, and this addition is eighty-three feet high. If the object of its erection was to ensure that the situation of the sacred shrine that contains the remains and the tomb of our greatest poet should be seen by all comers from as great a distance as possible, it has answered its purpose, for, from the windings of the river, which flows past the churchyard, over the lime-trees that form the interlaced green avenue to the church door, over the prosaic chimney-stacks of the houses in the pleasant town, and from all the low-lying meadows around in which Shakespeare wandered, it is a conspicuous object.

The spires on Warkworth and Newbigen churches in Northumberland are also after-thoughts—though very antique and hoary after-thoughts. The towers of both structures were finished without them, probably that they might be used for observation, if not for defence, like some of the other church towers on the same border; and it was not till a century, or longer, had elapsed that they were capped with spires. Both are at the west end of their respective edifices, but that at Warkworth is nearly twice the size of the other, and besides being branched, or sloped from the square of its base into its octagonal taper, has three stages of small gables. We may see the need for them both; for Warkworth Church is situated on the Coquet, on a site so low that it would be quite undiscernible from the adjacent country but for the spire; and Newbigen is on a rocky coast where a lofty landmark is of the greatest value to mariners.

For the most part, however, preparations for a spire are made from the foundations. To take Kettering Church, in Northamptonshire, as a fine example, we may notice that the tower and spire are treated so independently of the rest of the structure that they might have been intended to be isolated from it. The tower from the floor of the nave to its summit measures eighty-eight feet high; and the spire measures eighty-eight feet high, without including the vane. Although the ancient architect was aware of the effect of distance in diminishing the appearance of size, and gave his beautifully ornamented string-courses uniformity by arranging they should get larger

and larger as they approached the summit, he made the tapering lines of his spire perfectly straight, thus placing his practice against the theory that to produce the effect of straight lines at a great height they must be slightly curved outwards. He chose the same stone for his structure that the builders of Peterborough Cathedral and the churches at Stamford chose for theirs. Then he began to build his tower before he built the nave, about twenty-five feet square, with a grand arched doorway enclosed within a square head on the western side of it, and a staircase winding up in one angle of it. He made a floor for the bell-ringers within, and another floor above that, and then a third floor for the belfry, and placed mighty corbels at the base of the spire, on which it is supposed he intended the bells should be suspended for repairs. And then he commenced his geometrically perfect spire with stonework that was fourteen inches thick at first, but diminished to six inches by the time it was nine feet high. At each angle of the base he placed loop-holed turrets, and round it a battlemented parapet, also loop-holed, and provided with gargoyles to carry off the rain. He gave it three tiers of dormers of graduated dimensions, the lowermost being divided into three lights, the second into two lights, and the third having one light only; and up each ascending line of the octagon to its neck he placed rows of crockets. He finished the capstone with ornamental iron-work surmounted by a cock, which has since been superseded by a banner-vane. Veritably, a noble piece of the old English architecture of an old English country town!

Grantham spire, the summit of which is two hundred and seventy-three feet high, and Boston 'stump' are two remarkable examples in Lincolnshire; and the 'three tall spires' of Coventry, all lately restored or rebuilt, are as well known as the compassionate Lady Godiva. The twisted spire of Chesterfield, in Derbyshire, is also of considerable interest. The three spires of Lichfield Cathedral are of superb beauty. Norwich Cathedral and St Mary Redcliff, Bristol, have also fine spires; and Chichester spire has experienced the rare fate of falling down and being rebuilt. Stoke-Pogis Church, the centre of the scene of Gray's *Elegy*, has a spire comparatively lowly and quite rustic in its homeliness by the side of these; but still, by virtue of its associations, very pleasing, if not alluring. Indeed, look in what direction we may, these monuments of the prowess of our builders in 'the merry days of old' are to be met with. Glasgow has a graceful example in the grand Cathedral, rising with the tower two hundred and twenty-five feet into the air. Edinburgh also has a fine specimen in the spire of the General Assembly Hall.

As the very earliest churches had no bells, and therefore no belfries, there were no spires. When bells were first used to summon worshippers they were small, and were suspended in small bell-turrets, or bell-cots. After large bells were made, high and rich and imposing steeples were erected for their reception. Communities vied with each other to make them as magnificent as possible and in the number of bells they placed in them. They seem in early instances to have been placed at the west end of churches, probably in continuation of the custom in vogue before they were

required of placing strong towers there for the purpose of defence. Eventually, central towers were adopted, in cruciform buildings especially. These combined the purpose of a belfry with the addition of a vast open space in the interior, which gave light and grandeur to it. Small edifices may have been content with low conical spires or spire-lets in these remote times; but as years passed, succeeding builders made them more and more pointed, or needle-like, and generally of the same height as the towers on which they were placed. Every church tower was either finished with a spire or intended to be so finished at a future time. London when seen from a distance is said to have presented the aspect of a forest of spires. There were particular laws of construction always carried out, which need not be described except to mention that much of the sober, soaring, light and picturesque effect of their outlines is the result of the clever treatment of the transition from the square of the tower to the form of the pyramidal octagon. Recorded particulars concerning their erection are extremely rare; but more frequently in old churchwardens' accounts there are entries in which mention is made of them. For instance, the churchwardens of Ludlow recorded in 1545: 'In primis payd for a key to the dore that goothe up into the stiple ijd.' And again, in 1550: 'To Thomas Season for gowinge up into the stiple ij. wyndy nyghtes to save the glase ther in the wyndowis, xd.' The materials used differed according to the locality of their erection. Besides stone and timber covered with lead, we have examples covered with slates, and others with oaken shingles. This last covering is seen only on the spires of village churches in our southernmost counties.

The Great Fire of London caused the downfall of many noble spires in the metropolis; and the rebuilding that succeeded it, which included the reconstruction of fifty churches, inaugurated a new style of steeple. A preference for classic architecture had become the order of the day. On the classic temple-like structure that took the place of the old medieval building that had stood for five or six hundred years, adapting itself by additions to the needs of its succeeding centuries, the architects of the period placed *loggia* upon *loggia*, often formed of columns arranged in circles, or in octagons, or in squares with the angles cut off or canted, one above the other, which were surmounted by cupolas or obeliskal spirelets, with a ball and cross above all. The details and outlines were varied in each case, with columns, caps, cornices, consoles, pediments, vases, urns, lunettes, festoons of flowers, and rusticated work; but the general character of them all is that which we identify as the style of St Paul's, with its colonnades, dome, cupola, and gilded ball. Walpole called one of these new steeples a 'masterpiece of absurdity.' Some of them have double bases and double columns; and all of them were much admired, generally, by the art patrons of the day, who described them as chaste, elegant, and majestically simple.

Removed by two centuries from the battle of the styles, we can see the beauties of both dispassionately. And whether we look at our wealth of spires of the old Plantagenet times, or of this Renaissance of the manner of building in the days of the Cæsars, we must echo the sentiment of

Carlyle, who, alluding to the trade of his father, wrote: 'A noble craft it is, that of a mason. O Time! O Time! wondrous and fearful art thou, yet there is in man what is above thee.'

A BEGGING LETTER.

It was the breakfast hour at the Leys, a small country-house near the country town of Harpsdale, in Greeneshire. The owner of the house, Hilton Juler, Esq., was seated with his wife and children at the breakfast table, alternately using his knife and fork and fingering a little heap of letters which he had taken out of the postbag before sitting down. One of these, being directed in a strange handwriting, fixed his attention for a moment; but he left it and all the others unopened until breakfast was over. He then passed one or two of them to his wife, and with a merry face tossed one over to his eldest daughter with 'There he is again; thicker than ever.' Presently, he came again to the unfamiliar handwriting, and opening the envelope, read the contents carefully.

'Just look at that, Mary,' said he, as he handed the letter to his wife. Taking it, she read as follows:

SHEPPERTON-ON-THAMES.

DEAR SIR—I venture, though personally a stranger to you, to solicit your kindest attention to the following circumstances. The respected vicar of our parish, the Rev. James Barforth, has so often spoken to me of you and of your close friendship in your university days, that I feel sure you would wish to know of his difficulties. Three months ago he was seized with rheumatic fever, and incapacitated for the performance of any duty. The medical man has urged that Mr Barforth must not spend the spring in England, but at Mentone or in Algeria. We have started a subscription in the parish to enable him to follow this salutary advice, and we hope to raise at least one hundred pounds for this most worthy object. I have myself out of my own very slender means contributed ten pounds, though in order to do this I shall be compelled to forego my own summer vacation. I write to ask if you would be disposed to help a poor parish in a work of benevolence towards a very deserving man of God? I need not say, sir, that my present action is unknown to our dear vicar, and it is only because I happen to have heard that you were fellow-collegians at Oxford that I venture to trespass on your kindness. You will see from the enclosed list of subscribers that the movement commands the sympathy of all classes of persons, some of the poorest having gladly contributed their mite.—Awaiting the honour of a reply, and trusting it will be favourable, I am, your obedient servant,

HENRY TWIDALE, vicar's churchwarden.

'What a nice letter! How kind of them!' exclaimed Mrs Juler as she handed the epistle back. 'Of course, dear, you will send them something.'

'Well, yes; it seems a deserving case,' he replied. 'I remember Barforth well as a man of quite unusual ability. How he has managed to vegetate in such a spot as Shepperton I can't

imagine. A man of good family too.—Well, I'll send him a couple of guineas.'

Gathering up his letters, Mr Juler retired to his private room; and amongst the letters sent off that evening was one directed to Henry Twidale, Esq., with a cheque for two guineas enclosed, and a promise of a similar amount if it should be found needful. By return of post came a brief acknowledgment and thanks for the promise of further help, which, however, should not be claimed without absolute necessity. Mr Juler thereupon ceased to think of the matter. But a few weeks afterwards another letter came from the benevolent churchwarden, saying that the poverty of the parish must be his excuse for asking for the fulfilment of the promise of further help, especially as their dear vicar's health was improving so slowly. Now, this second letter arrived just as Mr Juler was starting for London, and he had only time to thrust his unopened letters into his pocket before he and his wife drove to the country station, two miles away.

On arriving at King's Cross, he drove to his hotel, where he left Mrs Juler. He then proceeded to keep an appointment in the City. This detained him until, as he walked up Ludgate Hill, he saw that the clock of St Paul's pointed to five minutes to four. Wishing to attend evening prayer in the cathedral, he mounted the steps, and secured a place just in time to rise with the rest of the congregation as the clergy and choristers took their places. During the singing of the anthem he happened to catch sight of a clergyman standing a short distance from him whose face seemed familiar. At the close of the service he looked more carefully, and recognised his old college friend. Making his way to him, he said: 'How are you, Barforth? I'm glad to see you are able to get about. I suppose you'll soon be off to Mentone? But really you haven't much of the delicate invalid in your looks.'

The clergyman, with a smiling rosy face and a firm grip of the hand, said: 'Why, whatever do you mean? Mentone? That's about the last place I should think of. Time enough to go there when I'm used up.'

'Well, but you *are* used up, are you not?' said Mr Juler. 'Haven't you just recovered from rheumatic fever?'

'No, indeed.—Where have you heard that tale?'

They had by this time arrived at the door of the north transept, and as they passed out Mr Juler said: 'Why, I've just sent something towards your expenses to a warmer climate. I was told you had been ill, and a change was imperative.'

'You astonish me,' was the reply. 'I was never better in my life, nor in better spirits. Here have I just been offered a large London incumbency, and I'm up now to settle matters before coming to reside here.'

'But haven't you a churchwarden named Twidale?'

'No,' was the decisive answer. 'One of my wardens is named Jones, the other is very properly named Church. I know nothing of a Twidale.'

Upon this Mr Juler felt sure he had been duped. Producing the letter he had received that morning, he gave his friend the history of

it. Mr Barforth at once pronounced the whole thing a fraud. The next step obviously was to put the matter in the hands of the police, who advised that Mr Juler should send some reply to the last letter, and they would watch the post-office at Shepperton with the hope of capturing the delinquent.

Now, Shepperton is a village about twenty miles out of London, and is composed of one street, three lanes, a church, and two shops. At one of these the post-office is kept. The day after the rencounter at St Paul's, a middle-aged man dressed in respectable gray entered the shop and accosted the proprietor, telling him that he was a detective from London and should need his help in certain matters.

"I suppose," he said, "you've no one in the place named Twidale?"

"No," said the postmaster. "But three weeks ago a strange gent come in and said as how his name were Twidale, and he expected a letter in a day or two, and would I keep it till he called for it, as he were only a-visiting here at present. So the letter come, and I gave it him."

"Ah!" said the other. "I thought so. Well, he's coming again, and I shall want you to help to identify him. And if you can quarter me in your house, I shall be glad."

As this could be arranged, he took up his abode there, and instructed the postmaster to give him a signal when Mr Twidale came on the scene. This happened the very next day. That morning, Mr Juler's letter had arrived, and upon being inquired for, it was, after a little delay, handed to Henry Twidale, Esq. At that moment a middle-aged gentleman entered the shop with a "How do you do?" and quietly asked for a postage stamp. Mr Twidale had opened his letter and read it hurriedly; then saying, "I shall call again early next week," he left the shop, being followed by the gentleman in gray, who had stayed to affix his stamp to a letter, and who never lost sight of his prey till he saw him enter a respectable house in a quiet street in Bloomsbury. Having run his fox to earth, the detective hurried to the nearest police court and procured a warrant for the apprehension of Henry Twidale, Esq.

Meanwhile, behind the doors of the quiet house in Bloomsbury Mr Twidale had been, welcomed by a pleasant lady and two children, and was soon seated with them at the tea-table. All the while Black Care and Nemesis were approaching rapidly; and before a full hour had passed, Nemesis in very unclassical gray tweed unceremoniously pushed past the servant who had answered his knock, and entered the sitting-room unannounced.

"Excuse me," said the detective; "I'm sorry to disturb you; but I've some very particular business with you, Mr Twidale. Will you step into the passage a moment?"

"Twidale!" said the other. "What do you mean? You certainly use no ceremony. You'd better leave this room at once, if you don't want to be kicked out."

"Now look here, Mister; this won't do with me. I don't like to put a lady about; but if you won't come outside, I must tell my business here."

"Confound your impudence! You've come to the wrong house, evidently." My name is Johnson."

"Yes," said the detective; "I know that. But you were Twidale this afternoon at Shepperton post-office."

The brazen front of Mr Johnson shook a little at this home-thrust. His wife, who stood looking at each in turns, here said: "Whatever does this mean? My husband has been in his office in the City all day, and has not been near Shepperton.—I must request you, sir, to leave this house."

"Now, don't you trouble yourself, ma'am. My business is with this man here; and if you don't know where he's been to-day, there's no call for you to know at present."

Mr Johnson still continuing obdurate, the detective said at last: "Well, I'm a police-officer, and I've got a warrant to arrest you on a charge of obtaining money under false pretences; and there's a cub at the door if you like to come quietly."

The poor wife, unable to credit her hearing, and unspeakably shocked and terrified, fell fainting into a chair, and recovered consciousness only to find her husband gone, her children weeping for they knew not what, and her home shadowed and desolate. "Women must weep," sang Kingsley; but there is a sadder weeping than that of wives who find their husbands' corpses 'out on the shining sand.' As the Nemesis in gray rode along with Henry Twidale, Esq., by his side, he remembered the stricken home he had left, and the thought curiously connected itself with a brief sentence he had learned when a schoolboy, and the din of London streets could not prevent these words from passing again and again through his mind, "The way of transgressors is hard, is hard."

Mr Twidale at his trial found the evidence altogether too much for him. It came out that he had for years been a professional beggar, with numberless aliases, with an extraordinary skill in the combination of circumstances, and with a facile pen which had been his chief instrument in wheedling contributions from a benevolent and gullible public. He met with a richly deserved punishment; but when Mr Juler and Mr Barforth learned how the man's wife had lived in ignorance of his profession, they did what they could to soften for her the heavy blow, and procured for her employment and a home.

M U S I N G.

WHEN o'er the soul the twilight of sweet musing
Comes stealing, and the day of Thought is done,
And Action lies—the fiery circuit run—
Its restless heat in restful languor losing,
There floating pass, the outward sense abusing,
Fair dreams of hopes fulfilled and joy begun,
Retracted glories of some hidden sun,
That lure the spirit onward to its choosing:
Then comes again the sound of happy laughter,
Then comes again the sight of glistening tears,
To mock the dusty labour of the years,
Which strive to bar the Past from the Hereafter.
So lights and shadows, ever mingling, roll
In tender twilight musings o'er the soul.

TRUSTS AND SYNDICATES.

IN writing about 'Corners' some time ago we also referred to 'Syndicates' as combinations of individuals in certain operations connected with trade. But, since then, the word 'Syndicate' has come both into larger use and into somewhat different application on this side the Atlantic. In effect, a Syndicate may be a corporation analogous to a Joint-stock Company, either registered as such or not.

A notable example of an unregistered Syndicate is that which has created such a revolution in the copper market within the last year or two. The Copper Syndicate was of French origin, and is under French management, although some of the capital employed in it is supposed to be contributed by Englishmen. The true history of this remarkable adventure has yet to be revealed; but what is known is that the manager of a French Company in the metal trade, and largely interested in copper, became so impressed at the unprecedentedly low price to which that metal had fallen, that he conceived the idea of forming a combination of capitalists to buy up all the available stocks. His scheme met with ready acceptance in the financial quarters to which he applied, and it also received the support of some of the French banks. Thus armed, the Syndicate set to work to buy all the copper that was then offered—the price at the time being considerably under forty pounds per ton—and also the shares of the large Copper Companies which were selling at very low prices. As the Syndicate bought copper, copper rose; and as copper rose, the shares rose still more quickly, so that an astounding success followed the first operations. But they could not be confined there, as the higher price now obtainable for the metal was stimulating the production of all the mines in the world. Therefore, to obtain complete control of the market, the Syndicate had to enter into contracts with all the large producing Companies to take either all or a fixed proportion of their product for a given number of years. What these terms were it is not necessary for us to explain;

and still hold, complete control of the copper market of the world; and are credited with having netted fabulous profits on their operations up to this time. One source of their profits has been the speculative energy with which opponents sought to force down the price of copper by 'selling forward' at prices considerably below current rates. The Syndicate allowed these sales to go on; but as the time approached to implement them, they ran up the price suddenly ten, fifteen, or twenty pounds per ton for the time being, and compelled the unfortunate 'bears' to settle upon these differences, while they kept the price to consumers on a moderate basis.

At the time of writing, the price of copper is about seventy-eight pounds per ton—that is to say, about double what it was when the combination was founded. The consumer, therefore, suffers to this extent; but it is proper to observe that the former low price was so unremunerative that it could not have long continued, as many of the mines would have been compelled to shut down. It is contended for the Syndicate that they have only brought about in a rapid way that which would have happened in a more disastrous manner, and that, while raising copper to a level fair to producers and not unjust to consumers, they have benefited everybody all round—especially the shareholders in Copper Companies.

This Copper Syndicate is worked like a regular commercial Company, the profits being divided periodically among the participants, after laying aside large sums for reserve.

To come nearer home. The success of the Copper Syndicate impressed some people in the salt-trade with the idea that the principle might be applied with advantage to that great industry. As everybody knows, the chief centre of production of salt in this country is in Cheshire. There it is found in two forms—rock-salt and brine-wells. The common practice was for a manufacturer of salt to lease a brine-well from the proprietor of the land, paying usually a fixed rental for his works, and a royalty either upon the brine pumped

or the salt manufactured. Not a great deal of capital was needed to work the trade, and as a consequence, there were a very large number of small manufacturers in the district, as well as a goodly number of large firms with capital. The conditions of the industry have been such that competition frequently reduced prices to an unremunerative level—in fact, salt is said to have been of late years more often sold below the cost of production than above it.

Be that as it may, the trade was in a most unsatisfactory state when the idea of a Salt Trust was broached. It was adopted eagerly by the small men, and was not rejected by the large men. In fine, a Company was registered on the joint-stock basis with a capital of some three millions. To this Company each manufacturer agreed to sell his works, plant, and stock at a valuation, and to take payment thereof partly in shares and partly in cash, most of the vendors, however, becoming the managers of their own works under the Company. Extending operations to the other salt districts, the Company has now obtained a virtual monopoly of the salt production of Great Britain. Of course there are other deposits of salt which can be, and which report says are about to be, developed; and there is always the sea around us, from which we can obtain supplies, as did our fathers before us. Moreover, there are abundant deposits in Russia, Germany, Spain, &c., which can always be marketed here at a price. These are the restraining influences upon the Salt Union; nevertheless, the practical effect of the combination up to the month of November last was this: the price of common salt for home consumption had been advanced from two shillings and sixpence to nine shillings per ton, being an increase of six shillings and sixpence per ton; and the price of lump-salt for export had been advanced from eight to fifteen shillings per ton, or an increase of seven shillings per ton. As salt is an article consumed by every man, woman, and child in the country, as well as the basis from which many chemicals for manufacturing and medicinal purposes are made, it will be seen that this Salt Union is really a concern which affects the pocket of everybody.

So successful has been the Salt Union from a producer's and capitalist's point of view, that various projects are in the air for other enterprises of a similar character. There has been talk of a Coal Union, or syndicate of colliery-owners; a Flour Union, or syndicate of all the millers between the Humber and the Tweed; and even of a Match Union, to comprise all the match-makers in this country as well as their competitors in Norway and Sweden. It is no part of our business to discuss the prospects of such projects; we merely mention them as evidence of the rapidity with which the craze for this modern system of trading is spreading.

• We owe it to America. A Salt Union has

been in existence there, in Michigan, for some twenty years. Its constitution is somewhat different from that of the English Union. In the American concern each manufacturer sells his salt—which must be of a fixed standard of quality—and passed by inspectors—to the Union, which then resells through its agents in all parts of the country, and periodically divides the profits among its members. These members can always obtain cash advances upon their product from the Union; but they may not sell a ton to any outsider without paying a heavy fine into the joint coffer. In effect, the result is the same as here; competition is removed, monopoly established, and the prices regulated on as high a level as prudence will allow. For of course to overdo the thing by raising prices extravagantly is simply to invite competition from all parts and from other combinations of capitalists.

The Michigan Salt Association is a small 'Trust'—a word which is now preferred in some quarters to syndicate—compared to the Standard Oil Company, which practically monopolises the mineral oil (petroleum) trade of the United States. This great Oil Company is one of the marvels of commerce, and it is said to be the most powerful combination of private individuals ever effected. Its capital is practically unlimited, and its sway is absolute. Certainly, a man who 'strikes it' nowadays has very little chance of securing his fortune unless he allies himself with the Trust. It is said to be ruthless in crushing opposition and competition, and to be not above starting a grocery store in a country village with the sole object of 'running off' a man who presumes, in defiance of warnings, to sell the kerosene of some opponent of the Company's.

On the other hand, it is claimed that by concentration of capital in the oil-trade, the Standard Company has reduced the cost of production to a point not possible under the former system: that by the immense scale on which its operations are conducted, such materials as barrels, &c., are provided far below the price at which individual producers could get them; and that, by their immense resources, the system of conveying the oil from the wells to the ports over hundreds of miles of country by 'pipe-lines' worked by a splendid method of pumping, has alone been possible. And had it not been for the enormous economy in transport which has thus been effected, American petroleum could not have stood the competition of other illuminants, and would have been 'played out' of Europe long ago. Nevertheless, the Standard Oil Company makes enormous profits, and is reputedly the richest and most paying trading corporation in the world.

There are other Trusts in America of the same general character, differing only slightly in their respective constitutions and methods of working. There is a Sugar Trust, a Cotton-seed Trust, a Glass Trust, a Milk Trust, an Oil-cloth Trust, a Sandstone Trust, a Coal-tar Trust, and a

great number of others of greater or less importance.

In fact, the development of this so-called Trust system has very properly created an uneasy feeling in the public mind of America. Mr Hugh McCulloch, one of the oldest statesmen in the Republic, recently addressed a solemn warning to his fellow-countrymen on the subject. Some of his words are worth quoting in illustration of what we have been saying: 'We claim that the United States is the freest country in the world, the only country, except Switzerland, in which the people have equal rights. Equal rights before the law are indeed possessed by everybody here; but are there not combinations of interests which prevent the full play of natural rights, which hold in check, if they do not destroy, individual enterprise? In what other country can be found such Companies as have been organised in the United States for the purpose of controlling the manufacture, the transportation, and the price of goods? Where can be found an organisation like the Standard Oil Company, which absolutely controls the market of an article for which there is an immense and constant demand, and stamps out competition; or even such Companies as have been formed to regulate the production of iron and steel and coal? In what other country in the world do manufacturers who are protected by tariffs against foreign competition, combine by Trusts and other agencies to advance or sustain prices and prevent domestic competition? We have yet to learn that there may be as little personal freedom under republican institutions as under monarchies, and that the best efforts of all good citizens should be to prevent the great Republic from being a free country in name only.'

We present this extract as reflecting one section of public opinion against these combinations. That section has become so strong as to attempt legislative measures to check the formation and limit the operation of Trusts; but it has not yet been strong enough to carry such measures.

Meanwhile, we in this country seem to be imbibing a taste for the very thing which America seems to be turning against. It is a curious position; but to enter upon the ethical aspects of Trusts would lead us into controversy hardly suited for these pages. The economic aspects, however, may fairly enough be looked at briefly. Those who are utterly opposed to the principle of these combinations maintain: That they must tend to create monopolies, and to drive small capitalists out of the businesses on which they encroach: That they endeavour to, and practically do, destroy competition, which is the 'soul of business,' and the great equaliser of prices and of profits: That they enable a comparatively few individuals to amass fortunes at the expense of the community; and that they are building up a form of power which may come to have dangerous influences upon both the social and the political fabric.

Those who defend Trusts, on the other hand, contend that the effect of them is really to cheapen commodities ultimately to the community by first cheapening production, owing to the concentration of capital and energy. It is usual in this connection to quote the Standard Oil Com-

pany, and to show that in the first ten years of the Company's operations the price of crude petroleum at the wells fell from ten and a half cents to about two cents per gallon. It is difficult to see, however, how the price of the raw material was only affected by the operations of the Trust, and not by increase of production both in America and elsewhere. The argument, indeed, hardly holds here, although it may be admitted that, in bringing the goods to market, the economies effected by the capital and influence of the Trust have been beneficial. On the other hand, however, it is possible that these economies might have been effected by the energy and ingenuity of individuals assisted by the competition of the great carrying Companies.

Further, the defenders of Trusts deny that the concentration of capital tends to destroy competition, but affirm that it only transfers the competition from small manufacturers to great associated corporations. As the handloom weavers were driven out by the factory, so the small manufacturers with limited means will be driven out by the Trusts. The competition of the future, in short, is to be between Trusts and Trusts, instead of between individual and individual, or Company and Company. This is what is called 'raising the level of competition.'

In effect, it is claimed that the Trust system is merely an extensive and legitimate application of the Joint-stock Limited Liability system. If it be economically right to enable a number of individuals to subscribe limited amounts in order to form a capital with which to conduct a special business under nominees, it is urged that it is equally right to unite a number of such enterprises under one head for the common benefit. Unfortunately, we are not all impressed with the virtues of the limited liability system as at present conducted, and it is rather 'a large order' to ask that the principle should be allowed to be applied without limitation. If there is to be no limit at all to its application, then it is possible to conceive of one vast incorporated Company swallowing up all the industrial concerns in the kingdom.

The driving-out of the small capitalists, moreover, is the most serious objection to the principle of these Trusts. It may be that these small capitalists would be better off, financially, as servants than as masters; but the bread of independence is sweet, and the greatness of England has been built up by individual effort and skill. Can we be content to see the individual wither while Trusts grow more and more, even if we were certain—which we are far from being—that we shall, as consumers, get our commodities cheaper and better in the future than in the past?

No doubt, 'Union is strength' in the employment of capital as in all other human operations. But there are higher things than mere money considerations to move the impulses of a thoughtful people. The essence of monopoly is antagonistic to an Englishman's love of individual liberty; the destruction of individual competition is opposed to his belief in 'a fair field and no favour.' Till within fifty years ago, 'forestalling' and 'regrating' were penal offences. They are not so now, and we do not stop here to inquire into the legal aspects of Trusts and Syndicates. But the public feeling which condemned forestalling and regrating still

exists; and on the whole it may be assumed, that whether economically sound or unsound, ethically just or unjust, the 'Trust' system will not find very congenial soil in this country.

JOHN VALE'S GUARDIAN.

CHAPTER IV.

THE night was dark, cold, and clouded, when Snelling climbed into his trap, and Isaiah following, took his place alongside. The lamps on either side threw a broad light upon the roadway, and the horse dashed off confidently at the retreating wall of darkness which lay before him.

'It's a pleasant sight, gaffer,' said Isaiah, 'to see relatives living together in unity and doing kindnesses one to another. Ain't it?'

The big man turned his head on his shoulders and tried to study Isaiah's countenance; but the night was too dark for him to see more than a pale blur. 'What do you mean by that?' he asked.

'It is a pleasant sight, ain't it?' Isaiah answered. 'I suppose there's hardly a warmer man to be found anywhere for ten miles around than Mr Vale.'

'And what do you mean by that?' demanded Snelling.

'You're fifty?' said Isaiah. 'Then he's sixty-five.—Ah! it's a pleasant sight relatives living together in unity and being friendly towards one another. You're a very hale and hearty man, gaffer; and it's amongst the likelier that you'll make old bones. It's struck me lately that Mr Vale looks frailish.'

'It has, has it?' demanded the Colossus gruffly.

'Yes, gaffer, it has,' replied Isaiah.

'Then I'd advise you,' said Snelling, with a deliberately vicious cut at the horse, 'to keep your tongue betwixt your teeth, mind your own business, and think about them things that concern you.—Do you hear?'

'Nicely, thank you, master,' Isaiah answered.

'Then, obey,' said Snelling with weighty authority; and for a time they rode in silence. When they had travelled two or three hundred yards, Snelling gathered the reins in his left hand, as a preparative measure, and then slashed the horse savagely with his whip.

'Hit him again,' said Isaiah; 'he won't tell anybody.'

Snelling, who had flogged the horse into a pace so wild as to be dangerous, pulled him to a moderate speed.

'Riled at me,' pursued Isaiah, 'for seeing through him, like a pane of glass. That's what he flogs the horse for.'

'You can take a month's warning, Isaiah,' said Snelling.

'Right you are, gaffer,' replied Isaiah.—'So I can. But you might say that once too often. I might do it one o' these days.'

'Do it now,' cried his employer.

'I should sleep on that, if I was you,' the man answered, with an exasperating tranquillity. 'Come now. Do you mean it? A month from this here 21st October? Say the word.'

'Can't you keep that foolish tongue from wagging?' Snelling asked him sullenly.

'Why, you bught to know that, gaffer, as well

as most men,' said Isaiah. 'You ought to know, if anybody does. You and your month's warning! Offer me that again, and I'll take it.'

'You're a born aggravater,' Snelling declared; 'that's what you are—an aggravater born and bred.'

'A month from this here 21st October,' Isaiah reiterated. 'Is that the bargain? Am I to take it?'

'Take it or leave it,' Snelling growled.

'No, no, gaffer,' said Isaiah. 'It wasn't me as put it there. Take it or leave it yourself.'

'Very well, then,' his master answered. 'You've got a pretty good berth, haven't you?'

'Did I ever say anything again it?' asked Isaiah. 'But I'll take that month next time it's offered to me, as sure as I'm alive.'

Affairs being thus adjusted, they rode in silence for the remainder of the journey. As they reached the gas-lit high street of Castle-Barfield, Snelling turned upon Isaiah and sulkily scanned his face. The man looked before him as if he were unconscious of the scrutiny; and the master flogged the horse anew, restraining him the while, as if he found some relief for his own feelings in that contradictory proceeding. In front of his own house he pulled up with a jerk and ordered Isaiah to get down.

'You didn't think I was going to sit here all night, did you, gaffer?' the irritator asked as he descended with a purposed and laborious slowness.

Snelling returned no answer, but dismounting in turn, strode to the shop-door, and thrusting it open, started a jangling bell. Half-way into the shop he turned, as if he had meant to say something, but restraining himself, he disappeared, slamming the door behind him so violently that the bell struck the woodwork and cracked, as the sudden harshness of its tone declared. Isaiah chuckled without the disturbance of a single feature of his face, and led the horse in at a gateway beside the shop. Then, having closed and barred the gates, he left the horse in the dark whilst he went to the stables for a lantern, and returning, released the poor brute from the shafts, led him to the stable, and there groomed him.

A single gas jet burned dimly above the counter, and by its light Snelling walked into the sitting-room, which lay immediately behind the shop, and commanded a view of it through a glazed door. There a small but cheerful fire was burning, and supper was laid out upon a snow-white cloth upon the table. The big man sat down to unlace his boots by the firelight; and a woman entering with a taper in one hand and a jug in the other, set the jug upon the table and lit the gas. She was a pale-faced, timid-looking creature of about fifty years of age, dressed with scrupulous neatness in a black stuff gown and a white apron. Her gray hair, which had not a sign of a curl, was brushed close to her forehead and gathered in a neat knot at the back of her head; and a white kerchief was pinned about her shoulders by a silver brooch no larger than a sixpenny piece. She lingered for a minute, touching the things about the table, and once or twice glancing at Snelling, as if she expected him to address her, but observing that he kept his eyes studiously turned away from her, she made a movement towards the door.

'Wait there,' said the master of the house suddenly. The woman paused. 'You can tell your husband, Mrs Winter,' Snelling began in a bullying and angry voice; but when he had got so far, he stopped short and threw his boots towards her. 'Take them away,' he said, thrusting his feet into his slippers. -- 'Never mind Isaiah to-night. I'll have it out with him in the morning.'

The woman stooped to pick up the boots, and left the room submissively. Snelling, with a wrathful face, thrust a chair up to the table and took his seat there. He attacked the cold meat with a lively appetite, and seasoned it with angry grumblings; but growing more composed by-and-by, lit his after-supper pipe, drew his armchair to the fire and rang for a glass of brandy-and-water. Under the soothing influences of this beverage and the pipe and the fire, he grew more and more composed. At length he felt himself in a mood for relaxation, and so, walking into the shop, he unlocked a safe there, and taking from it a bulky ledger, applied himself to the study of its pages with every sign of satisfaction. After an hour's enjoyment he put back the book, made a pilgrimage round the house, to see that everything was safely locked and barred, and went to bed.

He made no renewal of the night's misunderstanding (or understanding) with Isaiah when he arose in the morning, but contented himself with an added weight and gravity in his instructions for the day.

'And now,' he said in conclusion, 'you can harness the horse. I'm going to drive over to Mr Vale's, according to arrangement.'

Isaiah's face was absolutely expressionless; and Snelling's mastiff glance, which seemed to challenge a renewal of hostilities as it dwelt upon him, discovered no sign upon which to fasten.

Castle-Barfield and holiday would have made a sort of winter paradise to John, and nothing much more beneficent than the change and stimulus it might have brought him could very easily be fancied. It was a quiet sleepy place enough in those days, with its mile and a half of straggling high street, where the shops and the private houses shouldered each other all along except where they were broken by the fields. But to a boy bred upon a farm it was full of all those strange and delightful things which towns offer to the rustic intelligence. Everything is comparative. A Cockney thinks Birmingham a little place; Birmingham thought Castle-Barfield a hamlet; and to Castle-Barfield, Beacon-Hargate was an unpeopled desert. But when Beacon-Hargate folk went to Barfield, they talked about going into the town, as if there were no other in the kingdom. It had one bank in the middle of the long sleepy street, a solemn ancient edifice, which John had been in the habit of passing daily on his way to school and home again. When he read of the Bank of England and the bullion in its cellars, he thought of the bank at Barfield, and the one was no richer or more magnificent than the other, to his fancy. Then at the other end of the sleepy street was the police station, where the tramps called of an evening for their relief tickets, and the loafing, brown-faced, barefooted ragamuffins and their mournful female companions were to be seen hanging about for an hour or so on fine evenings, waiting the hour of issue. Thither on

Saturdays the small malefactors of the district were brought up for trial at Petty Sessions; and there was always a noisy crowd of the idlers and good-for-nothings of the neighbourhood, picturesque in the mass, and interesting and profitable to a boy of an inquiring and reflective mind. On Saturday evenings there was a market, through which it was a privilege to wander, which made sixpence look amazing small in view of all the tempting things for show and sale, though sixpence was a mite of wealth at other times and places.

John looked forward to a life amidst these surroundings with a pleased interest and expectation. The shops; the bustle in the streets; the couch, which ran twice a day in lingering, obstinate opposition to the railway; the railway itself, with its monster locomotives rolling past with trucks clanking with the iron produce of the district of fire and smoke so near at hand, and the express thundering past the station at a pace which made the air whirl and the solid stone platform quiver beneath the feet—all these sights were delightful in anticipation. Then Uncle Snelling's shop itself, with its bins and bags and drawers of seeds of every kind, and its dusty and subdued aroma: it would be pleasant to be on terms of intimacy with that abode of wonder, which, though no more than a corn-chandler and seed-merchant's shop to the adult intelligence, was a kind of fairyland to a boy. Then, again, there was an Assembly Room, to which John had once been taken on an afternoon, when all the windows were artificially darkened, to see a panorama of the Holy Land. It stood over against the bank, and made that part of the street doubly rich in association.

When Uncle Snelling drove over in his trap to carry John away, the boy was on the tiptoe of delighted expectation, and the lethargy and self-distrust which his mishap had left him disappeared for the moment. Uncle Snelling pulling up at the gate, solemnly barked for James the hostler; and James appearing from the stables, held the horse whilst the corn-chandler marched up the paved path into the farmhouse kitchen.

'It's understood between us, John,' he said, addressing the farmer, 'that the golden hours is not to be altogether wasted?'

'Just so,' Vale answered. 'He'll try the school of mornings, and see how he gets on with it. But he mustn't be drove too hard at first. And let him have a day or two's rest, to get used to the place before he starts. Let him begin on Monday.'

'So be it,' said Mr Snelling—'so be it, John. You can leave him safe with me. He'll be well looked after, and well took care of.'

'That I have no manner of a doubt of,' the farmer answered.—'Ready, lad? Give your old dad a kiss, then, and off you go.'

John, comfortably greatcoated, gloved, and muffled against the weather, threw his arms about his father's neck and kissed him, and then walked out to see the box which contained his belongings stowed away in the back of the dogcart. He had never slept from under the paternal roof, and the parting was full of romance and wonder. He mounted the dogcart, and sat in readiness a full five minutes before Uncle Snelling, who was engaged with a mug of home-brewed ale, emerged from the house. When Uncle Snelling came, he

put the springs of the cart to a good test, climbing ponderously in, and pulling the vehicle down on one side until it seemed as if he must overturn it.

'Good-bye, Robert; good-bye, John,' cried the farmer from the doorway.

Snelling's bass and young John's treble sounded together; the hostler slipped away from the horse's head, Snelling drew the whiplash lightly along the sorrel's flank, and away the travellers bowled on a firm smooth road. Every inch of the way was familiar to young John, and yet everything had a new look upon it, and the journey, though it was one of hundreds, felt memorable and like a surprise. Castle-Barfield high street had never looked before as it looked then, and never more had quite the same aspect to him. He had an affection for the loungers at the street corners, and felt so expansive beneath his small waistcoat that he could willingly have called out to the passers-by that he was going to live at Uncle Snelling's.

And indeed for the earlier days, life at Uncle Snelling's was an almost unmixed joy. Isaiah had a good deal of driving about to do in a tall trap; and John, to his great contentment, was allowed to go with him, and to hold the reins whilst Isaiah descended for the transaction of business. When he got back from these excursions in time, he went to the gates of the school playground and waited for young Gregg, and tramped a mile or so on the way home with him; and after a week's leisure he himself was sent to school again to work half-times there—a favoured pupil, who had light tasks set him, and was free both of scolding and the stumpy bamboo cane which Mr Macfarlane carried, and was a trifle overfond of using. Boys who had known other schools were gloomy about this bamboo, for it had properties the commoner growths of cane did not possess. Pins and hairs, though never so carefully introduced amongst the dry splittings at its end, failed to shiver it when it came into contact with the palm. Resin rubbed upon the skin was no protection against its sting. There was a general murmur and rebellion at it, as being an intrusion on the established rights of boys; and the commoner scholastic weapon would have been less detested if it had been even more frequently employed, though that, by the way, would not have been easy. Nowadays, when a schoolmaster cannot administer deserved chastisement to an incorrigible without a fear lest the boy's father shall 'take the law of him'—and when, apart from that consideration, the law, which governs children has grown less harsh—the master's sceptre and wand of office is held in no such terror as it used to be. But Macfarlane was one of those

Who always, always, spoiled the rod,
And never, never, spared the child,

if he could help it; and John, whose shaken and addled brains were unequal to any great weight of study, had reason to be thankful for the fatherly injunction which kept him off the punishment roll that quarter. There is scarcely anything which will continue to be wonderful if you look long at it, and yet it continues to be something of a wonder that a grown man should take a pleasure in beating children. Macfarlane did, though he always declared he didn't, and his youthful victims add the profoundest distrust in the phrase in

which he announced the mercifulness of his own heart.

'Now, boy,' would Mr Macfarlane say, taking a right-handed grip of the boy and a left-handed grip of the bamboo, 'this hurts me as much as it does you. But your conduct is of such a nature, that'—

Macfarlane's boys could never be got to credit that formula, though, Sundays excepted, they heard it every day of their lives. These floggings had a baleful effect upon John, who was naturally sensitive to other people's pains. They stunned him and made him dizzy, so that sometimes, for an hour after, he would sit with lack-lustre eyes staring upon his task, and seeing nothing and understanding nothing, except that there was a sick and pitiful muddle in his head which would not let him think.

Uncle Snelling during this time was pompous, and was disposed to take a boy at a disadvantage by the production of sudden posers in way of grammar, history, arithmetic, and so forth; but on the whole he was endurable. Isaiah was always friendly, and his wife cockered young John famously. So, on the whole, things went very fairly with him until the Christmas holidays drew near; and then, one morning, bringing all the greater terror and dismay because it was so utterly unlooked for, the trouble of his life fell upon him, and Uncle Snelling found himself face to face with a horrible temptation.

IN THE CITY OF THE GOLDEN GATE.

A WESTERN SKETCH.

THOUSANDS and thousands of good people still look upon California as a place where the inhabitants are lifted out of the rut of daily toil and transferred to a serener atmosphere, where, somehow, without being compelled to toil or spin, they are enabled to dress themselves like lilies of the field, and have manna and quails and their daily bread without the sweat of their brows. As humanity has a soft spot in its mercurial head, and believes strange stories and acts upon unaccountable impulses, let me say at once that an honourable living cannot be gained in California without work and care. Gold-mining, which for twenty years was the leading occupation of California, has now fallen to a subordinate position. A few years since, the twenty-five cent. piece, or 'quarter'—the equivalent of our shilling—was the smallest coin in general circulation in San Francisco. A man would give one or two of these to his shoeblack: the world went very well then. Now, all that is changed, and the five-cent. piece, or 'nickel,' does duty for the 'quarter.'

I arrived at the *Palace Hotel*, San Francisco, about mid-day. This hotel is, I believe, the largest in the world. It rises seven tall stories from the ground, and has, it is said, housed as many as two thousand five hundred guests. Certainly, all the passengers of an overland train or of a steamer may be stowed away with lightning-like rapidity, and every traveller as well looked after as though his own servant were receiving him in his own house. He is relieved of packages and wraps, and whirled up in an elevator to the rooms to which he is consigned. The entrance is under a graceful archway, and the

spacious central court is completely roofed over with glass.

For the first few days I was thrown upon my own resources: my companions had remained at Denver. But the Americans are a hospitable people, and the Californians are the most hospitable of Americans. The good-fellowship of Western life makes itself felt in the genial bustle of the streets. Though a stranger in the land, I felt no sense of forlorn loneliness such as I have often experienced. As I stepped into the roadway, the distant strains of *Tramp, tramp, the Boys are Marching*, played by a military band, broke upon the ear. Ladies in dresses of very light material and very bright colours, were promenading, in pairs and singly, side by side with others in sealskin. What could it all mean? Surely, thought I, some of them must have a touch of 'that same—you understand me—a speck of the motley,' as Charles Lamb puts it; and it couldn't be those who were lightly clad, because the thoroughfare was baking and blistering in the sun, and I should certainly have preferred discarding my blue serge jacket to donning an overcoat. The houses, in many cases built of wood, were not so tall, so red, or so plastered with advertisements as those of New York. There was a perpetual din of traffic and press of private equipages. The streets were thronged, the dresses were showy, the colours varied: all the indications of wealth and progress were there. One could no more be dull here than in the Strand. What myriads of restless feet had trodden these streets! What fortunes had been made! What hopes had been shattered! What awful deeds had been done amid the 'delusions and deliriums' of the gold-fever!

But now the people began to march in time, for the Second Artillery Band, still playing *Tramp, tramp*, drew slowly up in a street car. For a time the tread of feet was heard accompanying the music, then the car left us behind, the music ceased, and the passengers became less gay. In about an hour it became positively cold. The nights are always cold; and the changes of temperature, I learned, are so sudden and so great, that San Franciscans need the same heavy clothing in midsummer and in winter, and rarely feel oppressed by an overcoat. I now saw, what I have often had occasion to remark, that there is a reason for a good many things which at first sight appear absurd, and that it is well the traveller when in Rome should do as Rome does. I remembered that what once seemed to me to be the foolishness of our ancestors, had turned out to be their wisdom. I used to think there was something comic in the idea of prohibiting a man, so to speak, from marrying his grandmother, that mere age would be a sufficient disqualification, until one day a friend in the British Museum showed me the following paragraph in the *London Chronicle* for September 1772: 'Dublin.—A few days ago was married at Sligo, William Mooney, tobacco-spinner, aged 18, to Widow Vincent, aged 105.'

You can't describe San Francisco with a pen and movable types, any more than you can represent the heavens in a sketch-book. Its houses are the most heterogeneous collection in the world. Nothing can be more beautiful than the artistic homes of the Yankee millionaires, and

there are many of them. These are built of wood, and are in harmony with their surroundings. The palaces erected by the Vanderbilts and Stewarts on the Fifth Avenue in New York are so built as to leave no space for trees, shrubs, and flowers; whereas the magnificent residences which adorn California, Sutter, and other streets are surrounded by ample grounds, tastefully adorned with rare and beautiful trees, plants, and flowers. The business houses, which present a good appearance, are also built mainly of wood, though now and then you see a structure of brick and iron. Deep foundations are rendered impracticable by reason of the earthquakes, which, if not severe, are by no means unfrequent. Of course some of the by-streets of this metropolis of the Pacific coast, a city covering some twenty-five thousand acres, are as dirty as by-streets in London; that goes without saying. But for filth and wretchedness you must go to Chinatown by night. It would be a libel on Petticoat Lane and Seven Dials to compare them with a certain part of Chinatown. Chinatown is lawless, and so dangerous, that it would be about as safe to explore it without a guide as to stroke the royal Bengal tiger or the Nubian lion at feeding-time.

There are two private detectives attached to the *Palace Hotel*—mainly for the purpose of securing guests against the 'sappers-up of unconsidered trifles' in the shape of diamonds, dollars, brooches, &c.—and Mr Fred Dennis, the senior, generously offering to become my conductor, I 'did' Chinatown on the night of my arrival.

I am not an antiquary. I never could go into hysterics over a cracked teacup—my own or anybody else's. There are, of course, beautiful curiosity-shops in Chinatown, shops in which the attendants are dressed out almost as finely as the Celestials one meets in the neighbourhood of Bedford Square. But these did not detain me long. We passed through the market-streets, smoking in self-defence. Several women were in the streets; but my guide said that the ladies of quality never promenaded, for the best of all reasons—they could not walk. The calculating machines with which the Celestials do their reckoning and save their stationery are strange to white men, and their books are not easily decipherable. The streets were full of busy people, bargaining in high tones. We passed what I was told was 'once upon a time' a 'murder-house'; then we dropped into an opium den. Here half-a-dozen men sat on a platform, surrounded with the paraphernalia of opium-smoking. They prepared a pasty substance—an operation of some two or three minutes—put a bit about the size of a pea into their pipes, lit it, smoked it in two or three whiffs, repeated this operation until they began to get drowsy, and then spreading themselves on cushions, calmly waited for unconsciousness and 'sun-bright dreams.' The 'murder-house' we had just passed was in a narrow alley; and while we are watching the opium-smokers, my guide explained the *modus operandi* of its whilom tenant, which may be gathered from the following little Chinese legend, which purports to be an accurate translation of about two yards and three-quarters of Chinese manuscript:

'Chi Ching fell in love with Petti Sing. But Chi Ching was poor, and Petti Sing's father

insisted on her marrying rich Ah Tung, who was also a suitor for her hand. But Petti Sing had given her love to Chi Ching, and neither her father's threats nor Ah Tung's entreaties could make her untrue to her lover. In this state of affairs, old Petti Sing had recourse to Hong Di, the keeper of a murder-house. Hong Di lived in an alley, so narrow that not more than two people could walk abreast. There was no door in his house which opened upon the street, but only a window about three feet from the ground. This window was covered with a blind, behind which Hong Di waited for his victims. Down this alley at night came Chi Ching with old Petti Sing, the former on the side of Hong Di's house. When opposite Hong Di's window, Chi Ching was stabbed to the heart with a crease, a thin wavy dagger, sharp as a razor. His body was then pushed and dragged through the window, and Hong Di found means to dispose of it, this being part of his compact. Had the body been left in the street, Hong Di would have had little to fear on the score of detection: the presumption would have been that Chi Ching had been killed in a row or assassinated, by an enemy. Petti Sing, by some sense of which we have no physiological explanation, felt that her lover was dead, and wept so much that her beauty became impaired to such an extent that she was no longer an object of desire to Ah Tung, and old Petti Sing in disappointment destroyed his life. Hong Di's villainy was eventually discovered, and he was put to death with the crease with which he had deprived so many persons of life.

There are two Chinese theatres: the better one is in Jackson Street. Of the beauty of their plots I can say nothing: they are not to be understood without an interpreter. But besides a discordant clangour of gongs, a squeaking of stringed instruments resembling the creaking of doors, a booming and rattling of drums, a noise compared with which one of Wagner's operas performed by the inmates of Colney Hatch would have been soothing—besides all this, we had two murders, a suicide, and other dramatic bloodshed. What more could we expect for half a dollar?

Of the Chinese Buddhistic temples, of which there are four or five, I shall say nothing. Their restaurants, the best of them, struck me as being particularly clean. But there is something saponaceous about all Chinese cooks, and something greasy about their cooking which is to me distasteful. The meals were costly enough, and could be partaken of in true Chinese style. I have, however, a constitutional aversion to tea; and the bird's-nest soup, sea-slugs, bamboo sprouts, and other Celestial delicacies, tempted me not. Doubtless, they were good enough in their way; but, to use the favourite expression of a very great friend of mine, different people have different ideas.

San Francisco: singularly bare of trees; yet to no city could they be a greater acquisition. The people like sunshine; and to enjoy it they are willing to put up with dust. Sand-storms are the curse of the city.

When the heavens hang down to the languorous earth, and a palpitant white heat shimmers on the streets, it is pleasant to drive out to the Cliff House and watch the seals and sea-horses basking

on the sun-kissed rocks, and barking and rolling in the waves. The Seal Rocks are distant but a stone's throw from the Cliff House, whose foundations are licked by the 'furrow-faced sea.' Countless seals disport themselves in plain view from the Cliff House balcony; and no one ever thinks of discharging a rifle at them, not because—as Mr Froude seems to think—the Americans are less cruel than the English, less ardent in their sport, and have no love of killing for its own sake, but because there is a prodigiously heavy penalty for so doing. Beyond a few measly specimens in menageries and a fine herd in Yellowstone Park, where is the noble buffalo? In his wild state he is already as rare as what we call a white elephant, and in a few years he will be as much a thing of the past as the great auk. The coyote, or prairie-wolf, survives because he seems to have learned the art of living on nothing, and to have discovered the secret of continual motion; but the antelope-hunter has often to content himself with a sight of 'tracks.'

Unlike the old Indians of the North American continent, the negro has lived to improve his lot. From his face the am-I-not-a-man-and-a-brother look has disappeared. Freedom is 'writ large' upon his forehead; and if his employer is dissatisfied with his services, he leaves that benighted man, and seeks to confer a blessing on one more worthy. He occupies many positions of trust, and has so well obeyed the command to go forth and multiply, that he must of necessity ere long become a real power in the land. At present, the traveller makes his acquaintance in evening dress—white waistcoat, white choker—discharging the duties of waiter in many Western hotels, and no James or Robert in Piccadilly or St James's was ever buoyed up and sustained by a higher sense of the importance of the duties which he is called upon to perform, or a surer conviction that he will gain your approbation—and a tip.

I had been in San Francisco for about ten days, when an American speculator, whose acquaintance I had made in London, carried me off to his home in Oakland. Oakland is on the inner or opposite side of the Bay, is the principal town of Alameda County, and has forty thousand inhabitants. It is, so to speak, the fashionable suburb of San Francisco. Ferry-boats cross the Bay each way at intervals of half-an-hour. These ferry-boats are floating palaces. The saloons are gorgeous, with carpets downy as Turkish, costly mirrors, luxurious spring cushions, and panels resplendent with green and gold. From their decks by night the lights of San Francisco show like the flickering remnants of a monster pyrotechnic display. Oakland is far more beautiful than San Francisco. It is a city of bay-windows, gardens, and trees. Nature has been prodigal of indigenous evergreen oaks. Art has added palms, roses, and all the most beautiful favourites of the garden. Its drives, which are wide and smooth, are, thanks to a plentiful water-supply, innocent of dust; and its lawns are bright with grass almost as delicate and healthy as the grass of England. The gardens—and there is a garden to almost every house—are, many of them, large and luxuriant, all neatly kept. There is an aristocratic side to the principal street. The fashionable promenade rejoices in the name of

the 'four-bit' side, the opposite side of the way being known as the 'two-bit' side. 'Bit' is the American term for a ten-cent piece. Strange terms these for a democratic country, where one man is supposed to be as good as another—and a great deal better, as the Irishman said.

On the whole, I agree with Mr Froude, that the taste in California is greatly superior to what you see in New York. This is particularly noticeable in the interior of the Californian houses, where there is not the senseless agglomeration of costly things and over-supply of gold and showy colours which strike one in the East. Wealth cannot purchase an artistic taste. That faculty of the mind which discerns harmony with pleasure, and its opposite with dislike, though often intuitive, may be acquired by education and surroundings. A quantity of gold, silver, silk, china, and yards of painted canvas in splendid frames, are undoubted proofs of wealth; but great care must be taken in their arrangement, or the effect will be aesthetically unsatisfactory. The general taste of Americans is for display. To banish this from among them, the tasteful elegance of the French interior, the simplicity of the Italian, and the solid comfort of the English, might be studied with advantage, and imitated without being copied.

JEREMY YORK.

v.

THE world moved very slowly in those days, and Deal's solitary constable, Timothy Budd, had not fairly started for the house of the widow Bax on a road that would have brought him in time to the ancient and beautiful minster of Minster, until the clock in Deal church showed the hour to be a quarter before nine. He was mounted on a clumsy village cart, like to what Hogarth has more than once drawn, armed with the warrant, a full description of the tall young man, to the obtaining of whose name from the brig *Jane*, still lying in the Downs, the magistrate objected on the grounds of delay, and animated with full conviction that he would find the malefactor at his sweetheart's house.

The old village cart was drawn by a lame horse, that was occasionally to be impelled into a brief staggering trot by the one-eyed driver who sat by Constable Budd's side, and who on occasions acted as assistant or 'watch' to that worthy. A crowd followed the cart out of Deal, for the excitement was very great indeed; and many would have been glad to have accompanied the constable the whole distance; but this he would not suffer, sternly ordering them to turn about when they had proceeded half a mile, 'lest,' as he bawled out, 'the criminal should catch scent of their coming and fly.'

It was a drive of five or six miles. Constable Budd stolidly puffed at his pipe, with now and again a glance at his heavy stick, and an occasional dive into his coat-pocket, where jingled a massive pair of gyves or handcuffs, for such ease of mind, maybe, as the chill of the iron

could impart to him. Seawards, where the blue of the ocean showed steeping to the golden line of the Goodwin Sands, hung the huge white cloud of the line-of-battle ship, scarce stemming the slack westerly tide, though every cloth was aboard with studding-sails far overhanging her black sides and grinning batteries. Little was said by the two men as they jogged along between the hedgerows and past the sand-downs on that rosy and sparkling September morning, saving that when they were nearing Sandwich, Budd's mate turned and said to him: 'Timothy, it's the long chap, as he's described, as slept with the bo'sun, that you're to take, ain't it?'

'Oy,' said the other with a slap at his breast, where lay the warrant.

'But who's to know,' said the driver, 'that it wasn't the bo'sun as killed the long chap?'

'If you'd heered what was said, you wouldn't ask such a question,' answered Budd. 'I knew Mr Worksep. He wor a proper gentleman. Mr Worksep worn't a man to shed the blood of a flea.—Whoy, look here—the long chap comes ashore wanting money, and he goes to bed with a man with yough hand forty guineas in gold. It speaks for itself, Willum; it speaks for itself.—Now, then, probe this old clothes-horse, will 'ee? We shall be all noight at this pace.'

They rumbled through the streets of Sandwich, over the quaint old structure that bridged the little river of Stour; then to the left, into the flat plains—dashed here and there with spaces of trees—that stretched pretty nearly level all the way to Canterbury; and as the great globular watch in Constable Budd's breeches' pocket pointed to the hour of ten, the cart came to a halt opposite one of a group of cottages—the prettiest of them all, a little paradise of creepers and green bushes and small quickset hedge, shadowed behind with trees, with the dark glass of the windows sparkling in tiny suns through the vegetation, and the air round about sweet with a pleasant farmyard smell, and melodious with the voices of birds, and the bleating and lowing of cattle in the distance.

Budd and his man got out of the cart, threw the reins over a post, and walked to the house-door. It stood open. With a mere apologetic blow upon it with his fist, the constable marched in, and swiftly peeping into a room on the left-hand side, and noting that it was vacant, he turned the handle of a door on the right of the passage and stood in the threshold, filling the frame with his gaunt, knock-kneed figure and huge skirts.

A little table was laid for breakfast; the room was savoury with the smell of eggs and bacon and coffee. Half risen from his chair was the figure of York, a table-knife in his hand, a frown of amazement and indignation upon his brow; confronting him was a comely old lady in mourning, half risen too, and staring with terrified eyes and pale cheeks at the constable and the one-eyed face that showed over his shoulder. Close to York was his sweetheart, Jenny Bax, an auburn-haired little woman of eighteen, with soft dark eyes and girlish figure and breast of snow scarcely concealed by the kerchief that covered her shoulders.

'It's the Deal constable!' cried the comely old lady.

'What do you want?' exclaimed York, slowly rearing himself to his full stature.

'You!' thundered Budd.—'Put that knife down.'

York did so with an expression of amazement. The constable produced his warrant.

'I'm here,' he cried, 'to arrest you for the wilful murder, either last night or in the small-hours this morning, of Gabriel Worksoop, mariner, who shared his bed with 'ee and who's missing.'

He thrust his hands into his pocket with a look behind him, and in a breath almost, so quickly was it done, he and his assistant had thrown themselves upon York and handcuffed him. Ten minutes later, York, pinioned in the cart, between Budd and the driver, was being leisurely conveyed to Sandwich jail, whilst the widow Bax hung weeping bitterly over the form of her daughter Jenny, who lay motionless and marble-white, as though dead, upon the floor.

VI.

When York was searched, they found in his coat pocket a large clasp-knife with a ring through the end of it, capped (where the ring was) by a mounting of copper such as formerly might protect the butt-end of a pistol, upon which the words 'Gabriel Worksoop' were rudely scored. The knife looked to have been newly cleaned. There was no stain of blood or anything approaching such a mark visible upon it. In the pocket where this knife was they found a Spanish gold piece minted in the year 1690, with a hole through it, as though the coin was used as a charm or an ornament. His bundle contained merely a few tringles of wearing apparel. They also found upon him four shillings in English money and other articles of no moment as evidence. But when they came to strip him, they found the left side of his shirt heavily stained with blood.

All that he said was, he was innocent of the crime charged against him, but refused to declare more.

The first hearing was before the mayor of Sandwich and a bench of magistrates. The room was crowded; never in the memory of the most ancient inhabitant had anything of the kind excited so much interest, not indeed in the district, but throughout the south-eastern portion of the county. It was universally agreed that Mr Worksoop had been murdered, and by whom, if not by Jeremy York? But, then, what had become of the body? The marks of blood proving that it had been dragged to the timber extension were conclusive enough; yet it was almost inevitable that a corpse thrown into shallow water close inshore should be set upon some part of the beach by the action of the tide, unless weighted by a heavy sinker, in which case there would be a chance for the grapnel. But day after day, a broad tract stretching from Deal Castle to Sandown Castle had been swept without result. Would completer evidence be forthcoming? Would York confess, or make some admission that might help to solve the mystery?

The landlady of the *Lonely Star*, along with other witnesses, proved that the knife and the gold coin had belonged to Mr Worksoop. The landlady stated that she had frequently handled the coin, and that on the day preceding his dis-

appearance or death, she had asked him to sell it to her; but he replied that it had been given to him by a sweetheart twenty years before, and that he would not part with it for a ton of gold. She and other witnesses also testified to Mr Worksoop having been in possession of some thirty or forty guineas, which in his cups he had a trick of lugging out by the handful, that the company might know a jolly sailor need never be a pauper. The two boatmen that had rowed Jeremy York ashore gave evidence that he confessed he was 'only worth half a guinea, that there was a quarrel over the fare, and that they had to be satisfied with four shillings.

York's statement, on the other hand, was as follows: He said that on the night in question he fell asleep, after having lain with the boatswain for about an hour. He was then awakened by the oppression of the atmosphere, which made him fear that he would suffocate; and being parched with thirst, besides desperately fevered by the atmosphere, he resolved to seek for the inn's back-yard, where he might hope to find a pump, and where he would be sure of the relief of fresh air. As he could not lift the latch of the door, he searched Mr Worksoop's clothes, not choosing to disturb the man, who had shown himself querulous and grumbling, as though in pain, and found a knife, with which he succeeded in opening the door. It was a little past two o'clock when he returned to his bedroom; a faint light penetrated the window from the oil lamp outside, which enabled him to see that the bed was empty. He also took notice that Mr Worksoop's wearing apparel, that had lain upon a chair, was gone. He was somewhat surprised, but concluded that Mr Worksoop had been awakened, as he himself had, by the heat, had dressed and walked forth into the night, and that he would return presently. He got into bed again, but lay sleepless, until, hearing some distant clock strike four, he rose, clothed himself, took his bundle, and left the house, carrying away the boatswain's knife, which he would have left behind, had he remembered that it was in his pocket. He was unable to account for his possession of the Spanish piece of gold, which the witnesses swore had belonged to Mr Worksoop; nor could he explain how it was that there were blood-stains upon his shirt, in the bed, on the floor, not to mention the marks which terminated at the waterside.

Having heard the evidence, the magistrate committed him to take his trial for wilful murder at the forthcoming assizes to be held at Sandwich.

There was probably but one person living at that time who believed in Jeremy York's innocence, and this was his sweetheart, Jenny Bax. The widow Bax, after much mental awaying to and fro, arrived at the conclusion that the youth was guilty. How could it be otherwise? she reasoned, as did all others who discussed the matter. The mysterious disappearance of Mr Worksoop—the knife and coin in York's pocket—the bloodstains, the incriminating marks discovered on him—if these things did not point to his being the assassin of the unfortunate boatswain, what, in the name of truth, could they signify? But what had he done with the guineas, to obtain which, of course, he had committed the dreadful deed? Well, that was a thing not to be conjectured. It was strange, no doubt, that the

money should not have been found upon him when he was searched; for one might well think that if he had been artful enough to conceal his booty somewhere on the road to the widow's cottage, he would have taken care to hide such damning testimonials to his guilt as the knife and the Spanish coin. But it is always through some oversight on the part of the evil-doer that he is brought to book. However it might be as regards the concealment of the guineas and the retention of the knife and coin, it was beyond all dispute manifest that Mr Worksop lay somewhere secreted, a murdered man, and that York was his assassin.

Jenny alone believed in his innocence. She and her mother were poor; but had the widow been well to do, she would not have advanced a groat in defence of the man whom she believed a murderer. In the brief time that the lovers had been together before the arrival of the constable, York had told his sweetheart that he was in hope of obtaining the balance of his wages as second-mate from the owner of the *Cobia*; and this coming into Jenny's mind whilst her sweetheart lay in Sandwich jail, she wrote imploringly to the owners of the brig, spoke of the terrible charge that had been brought against Mr Jeremy York, and how neither of them had funds to enable them to procure counsel; and she prayed them, with all the might of her little bursting heart, to send her the money her sweetheart said was owing to him, that some effort might be made to rescue him from the gibbet. In response to this piteous entreaty, the owners of the brig sent her fifteen guineas, with which money she hastened to Canterbury and there engaged the services of the likeliest lawyer that that ancient city contained. This lawyer had several interviews with York, and he was candid enough to represent to Jenny Bax that though he would do his best, there was little or no hope. Beyond his solemn assurance of innocence, coupled with the carelessness, which certainly did not look criminal, of his suffering the knife and coin to remain in his pocket, the young man seemed incapable of stating a single point upon which the defence could rely or which it could make anything of. And it turned out as the sagacious lawyer had predicted: the evidence that had been previously tendered was gone over again, and far more diligently examined; the blood-stained shirt, the knife, the coin, were produced. The landlady of the *Lonely Star* along with her husband and six other witnesses were present to testify to the coin, to the knife (though the name scored upon it abundantly indicated the ownership), to the money in possession of the boatswain at the time of his disappearance, to the circumstance of Jeremy York having shared the bed with him, to the avowed poverty of the young man, to the blood-marks terminating at the timber extension, from which point beyond all question the corpse had been thrown into the sea.

The judge summed up, making but little of the circumstance of what he referred to as the heedlessness of York in retaining upon his person such incriminating articles as the knife and the coin. The jury conferred a few moments without withdrawing and returned a verdict of 'Guilty.' Whereupon his lordship put on the black cap, and after a tedious sermon on the hideousness of the crime for which the prisoner was to suffer,

sentenced him to be hung by the neck until he was dead.

VII.

In the days in which Jeremy York flourished, the gibbet was a much less conventional detail of the civilisation of the century than the gallows now is. Pirates and blood-stained smugglers were, to be sure, hanged in chains upon gallows erected on Thames mud. Execution Dock and the lower reaches were filled points in Jack Ketell's programme when it came to maritime tragedies or felonies committed in the home waters round about the coast within convenient distance; but the ordinary land-going felon was again and again 'turned off' in places adjacent to the scene of his wrong-doing. There seemed to the old-fashioned intelligence a sort of poetical justice in hanging a man within view of the spot where, according to the ferocious laws of those days, he had earned his bitter title to the halter.

In conformity, then, with this practice, it was decided that Jeremy York should be hanged on a gibbet erected within musket-shot of Sandown Castle; that is to say, within a mile or so of the old wooden structure on to which he had dragged the bleeding body of the hapless boatswain, and from which, with horrid secrecy, he had committed it to the sea.

It was a windy melancholy morning, sombre with the stoop of dusky weeping clouds sweeping out of the north-east, with an edge of frost in their occasional showering of wet. The sea ran a dark hard green under their shadow, with a ghastly glare of froth along the horizon where the surf was boiling upon the Goodwin Sands. The sandhills were dusky with crowds of people, who had assembled to witness the fine show of a hanged man; many full of curiosity, congregated close about the gibbet, that stood black and horrible like a hideous signpost pointing the road to Death, with the rope swayed by the wind dangling from the extremity of it. But the mass of the mob seemed to give it a pretty wide berth, as though it was an object to be best admired from afar.

One might have noticed, however, that amongst the people who lingered in the immediate vicinity of what used to be called the fatal tree was a knot of some eight or ten persons, whom the least observant eye might have suspected were present from a motive that had but little reference to curiosity. They were most of them young men, with a certain air of resolution in their manner; they conversed very earnestly; they might have been observed to measure the height of the arm of the gibbet from the ground, the length of the rope, and the space from where the noose would be when the end of it had been coiled about the neck to the sand beneath. Some time before the arrival of the felon, a woman of slight figure, in deep mourning, her face concealed by a veil, came to the steadfast group of men, conversed with them for a few minutes, then broke away sobbing passionately, and was seen to walk hurriedly in the direction of Sandwich. It was whispered amongst the crowd that she was Jenny Bax, the murderer's sweetheart; and several females who recognised her as she walked away, exclaimed that, for all her mourning and veils, she could not but be an unfeeling person to come and view the gibbet where her sweetheart was to be strangled,

even if she had not made up her mind to witness the whole scene from behind one of those sandhills she was skirting in such a hurry.

A little before eleven o'clock, a murmur ran through the crowd like the cry of a wave breaking aslant along a mile of shore. The procession was in view! a horse and cart, in which were seated, York the malefactor, the chaplain of the jail exhorting him, and the hangman sitting behind, with his legs over the edge, fortifying his spirits with a sly dram from time to time from a flat bottle which he drew from his pocket, for this was a country pageant, with nothing but rooks, and here and there a farmyard labourer, as sight-seers, no crowded progress, such as that from Newgate to Tyburn or Newcastle jail to the town moor. On one side of the cart walked the sheriff, on the other three constables, one of whom was Budd, and a small detachment of helpers after the pattern of the one-eyed man. Jeremy York sat cold and silent, gray as tobacco ash, habited in the clothes he wore when taken; he held his eyes bent downwards; his lips were compressed into two bloodless lines; he gave no heed to the chaplain, who mumbled in his ear; he had only spoken once since he had entered the cart, and that was to say to the ordinary: 'Sir, before God I am innocent.' All the while he lay waiting for the day of execution he had said no more.

The cart rolled up to the gibbet, and the constables and helpers drove the crowd into a circle round it. It was thought that York would make a speech, but he held his peace, never looking up. His arms were pinioned; the hangman hitched the end of the rope round his neck; the chaplain prayed earnestly and devoutly; the crowd held their breath, and not a sound broke the dreadful stillness saving the dreary sweep of the wind over the sandhills and the seething and hissing of the breakers rising and falling upon the shingle. The sheriff then gave the signal; the driver who held the horse's head started the animal, the cart rolled away, and left Jeremy York hanging.

But scarce had he swung to an erect posture under the gibbet, when it was observed that the hangman had not allowed for his considerable stature; his toes touched the ground; but ere the crowd could well distinguish this, the group of men whom the veiled woman in black had conversed with gathered round the 'suspended figure in such a way as partly to support it. The sheriff, conversing with the hangman, looked away; no notice was taken of the action of these people, for it was a common custom in those days for friends of a malefactor to gather about him after he had been turned off, to shore him up, and to do their best to keep him from strangling during the half-hour in which he dangled. The crowd looked on; what the group of men were trying to effect they might have guessed; but whether the criminal should be ultimately saved or immediately throttled was all the same to the mob, as it was apparently to the sheriff. It was an execution anyway; this was the sight that the people of Deal and Sandwich and of adjacent hamlets had covered the sandhills to witness, and be the issue of the spectacle what it would, there was nothing to disappoint them in the presentation of it.

At the expiration of half an hour, time was called by one of the men who crowded round

the motionless body; the sheriff signed to the executioner, who, springing forward, severed the rope, and the body fell into the outstretched arms of those about it. A minute after, a small cart, containing a shell, was brought to the gibbet, the body was placed in it, five men of the group who had clustered about the pendent form sprang into the cart, and within a few moments the vehicle was being driven rapidly in the direction of Sandwich.

TRAPPING TIGERS.

AMONG the most interesting of books to Scotchmen who love to read of the words and works of their fellow-countrymen in distant lands and among stirring scenes of adventure and peril, is the *Lives of the Lindsays*, published by Mr Murray in 1849, and not the least interesting pages of this delightfully clannish compilation of tales of travel are those contributed by Robert Lindsay, who was Resident of what was then known as the 'Province' of Sylhet, just one hundred years ago. To his successors in charge of one of the swampiest and prettiest districts of India—a collocation of adjectives which shall presently be explained—it is tantalising to read that in days of an easy and paternal administration and ample leisure, it was possible, in twelve years, with a nominal salary of five hundred pounds a year, to amass a large fortune. The lucky Robert, while yet a young man, was not only Resident over the valley of Sylhet and the marshes thereof, but enjoyed a monopoly of trade with the inhabitants of the surrounding hills, of which those on the north, a huge wall of limestone five thousand feet high, seamed with cascades and clothed with orange-trees, provide the district with scenery so picturesque that the wonder is that it has been so rarely and so inadequately described. Nowadays, Robert Lindsay's degenerate official descendant receives a bare salary, which, counted in depreciated rupees, is worth little more than the nominal emoluments of a hundred years ago; and with this he has to face enhanced prices, a more civilised society, and the withdrawal of the prohibition to trade. Truly, the golden age of Indian officialism has passed, never to return—to join 'the snows of yester-year.'

Meanwhile, other things have changed. The low jungle-crowned hills which extend into the district, like the fingers of an outspread hand, from independent Tippera on the south, have been reclaimed from tigers and elephants, and are covered with flourishing tea-gardens, in the opening out of which Robert Lindsay's countrymen have borne no small share. To meet the wants of these and carry away their tea to Calcutta, great steamers ply the waters of the Surma and the Kusira, and their booming whistle is heard in the quiet villages which nestle under ancestral peepul and tamarind trees on the densely populated banks of the two great rivers of the district. But in the villages themselves very little is altered. To a man who knows India,

nothing speaks so strongly for the inrooted conservatism of its people as the perusal of such a narrative as that of Robert Lindsay. The Autocrat of the Breakfast Table revisits Europe after an absence of only fifty years, and delights to pick out and commemorate the institutions and habitations which have survived since his last visit, evidently because they are oases in a desert of change. But Robert Lindsay, if he refrained from visiting the tea-gardens, might well imagine himself to be in his old province in the old times, could he return to it now. His arrival in a green budgerow—if he wisely abstained from travelling in a cargo steamer—would be greeted by a fleet of boats, more or less gaudily equipped with bunting, and filled as of yore with his obedient and obsequious *ontahs*, or native subordinates. He would find the ancient and picturesque mosque of Shah Jalal still visited by devout admirers of the wandering saint, who pitched his tent here, on the extreme limits of Mohammedan rule, three hundred years ago. And as for the villages, they stand where they did, and their inhabitants live much the same life, with its easy round of agricultural labour, much facilitated by the abundant and never-failing rains which have made Cherrapoonjee the meteorological wonder of the world. Their amusements are much as they were one hundred years ago: boat-racing in long canoes on the noble rivers and in the great shining meres of the southern valleys is still practised. And above all, the page which we are tempted to extract, and which describes the sport of trapping tigers, is still a true description of a very characteristic and picturesque incident of Eastern rural life. Robert Lindsay's account runs as follows: "Large traps, constructed of wood and turf, with four doors successively opening from each other, are built in such places as the tigers frequent. The bait is a living bullock in the centre. The tiger may enter on either side: on treading on a spring, the two counter-doors drop, and he is secured, while the bullock remains in perfect safety. A tube or cylinder, of about twelve feet long and eighteen inches calibre—made of mats, and fortified with rope or ground rattans, and secured at the further end by two sticks run across it—is now introduced; and the tiger, being previously teased in the trap and abundantly anxious to escape, seeing this ray of daylight conveyed into his prison through the tube, gathers himself together and darts into it, in hope of finding a passage at the opposite extremity; but is stopped by the crossbars. A man stands by to drive in two other bars across the end by which he entered. No mouse was ever more inoffensive than this powerful animal now finds himself; the whole space he has to move in is only eighteen inches calibre, which barely allows him to move, and I have repeatedly taken him by the whiskers with impunity."

In Robert Lindsay's time, the unfortunate animal was usually carried to the walled enclosure of a deserted mosque, and there, in presence of an excited crowd of spectators, compelled to do battle with a buffalo, tame or wild. The result was seldom doubtful; for if the buffalo once got his opponent within reach of his huge and massive horns, the unfortunate tiger was tossed from one horn to another with a dexterity of

which the uncouth gait of the buffalo gives small promise, and was speedily killed.

Nowadays, the captured tiger or leopard is usually carried in triumph to the homesteads of the more wealthy landowners, who are expected to recompense the captors with presents suited to the donors' importance and wealth. When the poor beast is worn out by its ineffectual struggles in the confined space which renders its mighty muscles powerless, it is conveyed to the nearest official, who has it put to death as speedily and mercifully as possible, and disburses the customary government reward, the amount of which seems to have been determined a hundred years ago. One improvement only has been effected in the method of capture. On the trapdoor is now usually mounted an empty kerosene oil tin, the work of distant American tinsmiths, and this serves by the clatter of its descent to waken the builders of the trap, who commonly sleep in a temporary hut hard by.

The process of driving the tiger into the long 'tube' of mats and rattans is more exciting and dangerous than Lindsay's description would lead the reader to suppose. The trap-door has to be raised to admit the end of the tube, and there is always the possibility that the infuriated animal, whose roars are loud enough to strike terror into the stoutest breast, may break loose on either side. Consequently, an excited ring of villagers, armed with spears, billhooks, and perhaps even a rusty muzzel-loading fowling-piece or two, is formed round the trap, ready to account for the animal, if his exit should not take him into the cunningly devised tube. If he does break loose, a general stampede is not uncommon, or else one or two of the stouter villagers receive honourable wounds from tooth or ravening claw. But more commonly the frightened beast crawls quietly into the long tube, and is powerless, in spite of the fragile appearance of his mat envelope, which in shape exactly resembles the pink or white biscuits which are commonly eaten with ices. It is a curious sensation to see a tiger's growling face within a few inches of your own, and to be able, if you are so little magnanimous as to follow Robert Lindsay's example, to pull the great cat's whiskers. I have even known young men boast, with a fine air of paradox, of having shot tigers in their own verandas; but the tiger was swaddled in one of these tubes, and to slay him was but butcher's work.

In many other respects than the custom of tiger-trapping the inhabitants of Sylhet are conservative folk. The district was one of the first to come under British rule. It has been under the administration of several officers, who have subsequently won fame in more important spheres. It has even, for Englishmen, a faint flavour of literary interest, for one of its earliest magistrates was the father of William Makepeace Thackeray, as the name of Thackeray Street in the town of Sylhet testifies. But to this day wheeled vehicles are unknown in the greater part of the district, and roads are yet to make. On market-days, the rivers are thronged with thousands of boats; or, when the drier season of winter stops this mode of communication, the villagers trot in Indian file along the footpaths leading to the market, bearing on their shoulders a bamboo, from each end of which is suspended a load of merchandise. When

a European travels in the district, his tent and his camp equipment must needs be carried in similar fashion. And if the outward aspect of life in Sylhet is little altered, there is probably even less change in the mental attitude of the two millions of cultivators who till its rice-fields. Education has extended marvellously; every village has its little vernacular school, every 'subdivision' of four or five hundred thousand people its high or middle-class schools. But for the most part the people are content to live their traditional life, and to see as little as possible of the busy world outside. The Sylhetia has an ill reputation among inhabitants of other parts of India for manners and morals, a reputation not entirely deserved, and won partly by a sturdy provincialism and local patriotism and pride which has something attractive about it. One of the difficulties of the wide-spreading, all-embracing British rule in India is this, that the laws which are passed in Calcutta embrace the whole country, and include such conservative and old-world tracts as these. Municipal boards and local councils have to be created, and fostered and propped up with official praise. But they are foreign to the habits and traditions of the people, who are for the most part quite content that the work should be done for them by their European ruler. And so the matter is commonly compromised. The 'magistrate,' unlike the conventional constitutional monarch, really rules under a pretence of governing, and the compromise works fairly enough. Possibly the people are being slowly inducted into the elements of popular government, at least in local matters; but before they can attain to any independent control over their local government, there are not wanting signs that they will pass under the hands of wirepullers and agitators, whose advent the most easy-going of officials cannot regard with approval or without anxiety.

We must not leave Robert Lindsay without one more extract, to prove that in some respects British rule has worked wonders in the way of civilisation. He is describing the Khasia chieftains who had come to meet him to negotiate for the lease of their lime-quarries, the possession of which was the most important step towards the fortune which he took home with him to Scotland. 'In order to pay due attention to the great man, they had come down from every part of the mountain, accompanied by their retainers, dressed in the garb of war; and when thus accoutred, their appearance is most unquestionably martial, and by no means unlike our native Highlanders when dressed in the Gaelic costume. Many hundreds of this description were now before me. But my new friends on this occasion breathed nothing but peace and friendship; though it was still evident, from their complexion and from the war-yell that occasionally escaped their lips, as well as the mode in which they handled their weapons, that their temperament was not dissimilar to that of other mountaineers; and the opinion I thus hastily formed I found corroborated in the sequel. We had a most sumptuous entertainment on the turf.* Our viands, to be sure, were neither of the most costly nor delicate nature; nor were the decorations of the table such as would suit the dandies of the present day. The repast consisted entirely of six or eight hogs,

barbecued whole, or rather roasted in an oven, according to the Otahite plan—a hole being dug in the ground, lined with plantain leaves, and filled with hot stones—the hogs placed therein—more hot stones laid on the top, and the whole covered with turf. The chiefs acted as carvers, their dirks being the only instruments used, and the large leaves of the plantain served for plates. The entertainment was universally admired, and abundance of fermented liquor closed the festivities of the day.'

The Khasias still eat pigs and drink fermented liquors. A favourite dish among European habitués of the Cherrapoonjee dawk bungalow is a tender Khasi sucking-pig roasted, to whose crisp succulence only Charles Lamb could do justice. And as for Khasi beer, it is not bad stuff when better is not to be had. But in other respects these wild 'Tartars,' whom Lindsay took to be 'inhabitants of the high range which separates our possessions from the Chinese frontier,' have altered greatly for the better. A magnificent cart-road traverses their territory from north to south, terminating at one extremity in our civil station of Gauhati in the plains of Assam, and at the other in the new wire tramway which plunges temerarily from the brow of the hill below Cherrapoonjee into the plains of Sylhet. Midway, in the very heart of the hills, lies the charming station of Shillong, bosomed in fragrant pine-groves, the headquarters of the new province of Assam, of which Sylhet is the most populous district. The Khasias are now as peaceful as the Highlanders among whom Robert Lindsay ended his days, and have become great traders. Many of them are converts to Christianity, owing to the zealous labours of the Welsh missionaries, whose stations are scattered all over the hills. Two Europeans wandering on a walking tour, not long ago, in a part of the hills where they supposed few of their colour had been before, were greeted by a chorus of school children singing, 'Men of Harlech, flags are streaming!' Quaint old superstitions linger among them, such as that of the great serpent who is said to have lived in a cavern in the hills, and whose ghostly shape haunts certain families, who have to perform ghastly sacrifices to its memory if they would maintain their property. But a European may wander with perfect safety, unarmed and unattended, from end to end of the hills, and may enjoy the lovely scenery of their unequalled gorges. He must be an experienced traveller, indeed, who has seen anything more lovely than the glassy veil of the Maosmai waterfall, spread over the face of a great fern-clad cliff, or the wonderful view from the summit of the bare brown Kullong rock. And of the people he will retain the pleasantest memories: of the stout, muscular good-humoured men, dirty and smiling, one cheek invariably distended with a great quid of betel-nut; of the women, buxom and plump, and equally good-natured and dirty; of the sturdy children, who shout a friendly 'kooblay,' or good-morning, after the traveller, and are rapturously thankful for a copper coin wherewith to buy oranges.

Of Robert Lindsay himself it only remains to say that he seems to have followed the best traditions of Indian official life in securing the confidence and intimacy, so far as that is possible, of

the natives under his charge. The task was an easier one in the days when more independence was allowed to the heads of districts, when the mere routine of governing was less absorbing in its multiplicity, and leisure was more ample. But the tradition has not died out; and many an Indian official, spite of depreciated rupees and the cost of remittances, spite of inspections and reports and the crushing grind of modern administrative work, loves his district, and is proud to own many good friends among its inhabitants.

ANTIPYRIN.

PROBABLY no class of investigations has been more popular with chemists of recent years, and certainly none have been more prolific of wonderful results, than those in which they have attempted the artificial production of alkaloidal substances. It was, for example, in the attempt to construct an artificial quinine that the first aniline colour was discovered—a discovery which has developed one large and important industry and revolutionised others. It was in conducting investigations in similar directions that one of the latest remarkable discoveries was made—the production of saccharine, a substance recently noticed in these pages. Between these two discoveries, which in a certain sense might be termed the earliest and latest valuable products of public importance derived from coal-tar, there lies a third, which has all these years been slowly but surely developing; and although the discoveries connected with it may not startle the world in the same way that both mauve and saccharine did when first introduced, still they promise to be equally important in another way, and deserve more than a mere passing notice.

The discoveries referred to are full of technicalities, and it would be out of place to discuss these at present; but if the developing process just spoken of is to be thoroughly understood, it will be necessary to explain that a certain chemical relationship exists between quinine, a well-known alkaloid derived from the cinchona bark, and another substance called chinoline. This last substance can be prepared, amongst other ways, from coal-tar; and from the circumstance that it had medicinal properties similar to quinine, as well as this chemical relationship to it, it was thought that some new alkaloidal substance might be built up from it which would take the place of quinine. Hence the reason that, since the year 1881, chemists have been systematically, persistently, and also successfully pursuing their investigations in this direction. One after another of such valuable coal-tar alkaloids have been discovered, and several of them at the present time are slowly, but certainly, changing one department of medicine, and no one can quite foresee how very important these discoveries may yet be, alike to science and medicine. All these coal-tar alkaloids have a powerful tendency to reduce the temperature of the body in cases of fevers, hence they are called antipyretics; and antipyrin, it will at once be understood, derives its name not from anything connected with its composition or

production, but from its antipyretic action as a medicine.

It was discovered several years ago by Dr Knorr of Munich; and when its important medicinal properties were also discovered by repeated experiment, its manufacture was handed over to a Company, who acquired proprietary rights, and in their hands it has remained very much ever since. For a considerable time, little was known regarding it; but ultimately Dr Knorr published a paper on its chemistry, and thus scientific men got to know its composition and mode of production. Chemically, it rejoices in what, to ordinary minds, will appear the unpronounceable name of 'Dimethyloxychinizin;' such a name, unlike antipyrin, being intended as much as possible to represent to scientific men its chemical constitution.

It is one of the very best antipyretics ever discovered, not even excluding quinine. It reduces the temperature in cases of fevers with almost unflinching certainty from two to four degrees within two hours of being administered, and this, too, without the after-disturbing constitutional effects of quinine. This thermic effect of antipyrin seems to be much more prolonged than in the case of the majority of the other newly discovered antipyretics, and equals anything ever produced by quinine. To quote two cases out of many which have recently appeared in the medical journals: fifteen-grain doses were given to two patients suffering from typhoid fever, and reduced the temperature nearly to normal, while in both cases a refreshing sleep for five or six hours was obtained. In commerce it appears in small white crystalline scales, and also as a white powder, in both cases being soluble freely in water, without smell, and of a mild bitter taste. It is thus very much easier administered than quinine, particularly to children and those patients who cannot readily take nauseous medicines. When first introduced, it was entirely for its antipyretic action; but medical men were not slow in discovering that such a valuable agent could be advantageously employed in many cases besides fevers. It is, for example, recommended in cases of phthisis, pneumonia, pleurisy, neuralgia, lumbago, sciatica, and in that distressing complaint, sea-sickness. In short, its history is intimately connected with the history of medicine for the past three years, and it would be difficult to cite all the different cases in which it is recommended to be administered.

Probably, however, it has attained its greatest popularity in this country, so far as the general public is concerned, from being recommended as a cure for headaches. The writer has daily means of knowing that its use in this respect is largely increasing, and this of itself is sufficient to prove that in such cases it is useful. Only those who know how distressingly common this complaint is can rightly understand and appreciate what a public boon it would be were a reliable and at the same time a safe cure to be discovered. It is not to be expected that it will prove a panacea in every case; but that it has a wonderful power in many cases in allaying if not in entirely averting these painful attacks is undoubted. It may be given in doses of from ten to twenty grains with perfect safety, either at the commencement of the headache, or as soon after as possible,

and rest should be taken for several hours afterwards.

One peculiar circumstance remains to be noted as to antipyrin, namely, that while introduced, probably in the first instance, as a rival to quinine, not so much in regard to efficiency as in regard to price, its market value at the present time ounce per ounce in this country is double that of quinine. If the respective dose of each substance be taken into consideration, the value is more than four times that of quinine, as antipyrin as a rule is given in doses double that of quinine. Notwithstanding this fact, its popularity and consumption are daily increasing, and as it gets better known, will no doubt increase still more. As evidence to show that it holds an equal reputation in its native home, it may be mentioned that it has officially been recommended for introduction into the next edition of the German Pharmacopœia.

FROM A CANADIAN BANK CLERK'S NOTEBOOK.

THE business of banking is generally regarded—and quite rightly—as a very serious one. The most enthusiastic member of the profession will hardly assert that it offers much scope for the display of wit and humour. Yet here too 'the eye sees what it looks for,' and even a bank clerk bent on discovering an amusing incident to enliven the monotony of business hours, will occasionally find one—in Canada, at least. The writer cannot answer for the mother-country.

Who, for example, could help feeling grateful to the unconscious humourist who writes :

DEAR BANK—Pleas find enclosed 25 dollars, the amt of My note to —. The note is Due Nov. 3, but I send the money to days a head, as I am awfully afrade of Banks.—Pleas send the Note to yours truly, J— S—.

The writer of the above frankly confesses his mistrust of our profession. But many of our correspondents display a gratifying confidence in our good-will and energy. Among these is the country farmer who wishes to dispose of twelve pounds of salt cod-fish, and who writes to request the biggest bank in Montreal to conduct the transaction for him. Another equally confiding countryman desires to invest in ten pounds of maple sugar through the same medium.

Among the doubters is the old lady who presented herself the other day at the Savings-bank department with a demand for the one hundred dollars she had recently deposited. She received the money, and forthwith retired to a seat for the purpose, it was supposed, of depositing the notes in her boot, according to the graceful custom of many country customers. But after subjecting the notes to a close and rather suspicious scrutiny, she got off her stool and handed them again to the teller. 'I don't want 'em,' she explained. 'I've got no place to keep 'em in at home.—Why, if I was to have 'em in the house, Jim—that's my boy in the lumber-trade—he'd have 'em away from me right off, bless him! I only wanted to be sure I could get them any time I liked.' And she departed, fully satisfied with the success of the experiment.

Many of the Savings-bank depositors cannot sign their names; in which case they make their mark, and a note of their personal appearance is entered in the ledger. Mistakes sometimes occur here, as, for example, when a young man found himself described, much to his disgust, as having 'prominent hair and black teeth.' Another was entered as 'a small boy,' and the description was transferred from ledger to ledger by successive clerks, until, at the age of thirty, the depositor appeared to claim his accumulated savings, and found difficulty in getting the money because he 'did not answer to the description.'

'Mary Ambrose' is evidently aware of the necessity for clearly proving her identity, for when she writes to withdraw her savings, she is careful to sign herself, 'Mary Ambrose, wife of James Ambrose, plumber and painter, Eric City, Penn., and sister of William Wyer, blacksmith, Staffordshire, England.'

Mrs Elizabeth Molloy is a well-known visitor to the same department. She is frequently the worse for liquor when she appears to transact her business. On one occasion she wanted to draw seventy-five dollars without taking the preliminary step of depositing them. A somewhat stormy interview with the ledger-keeper ensued, which ended in her taking her departure, at the threat of ringing for the police. The next day she appeared again, and informed him she had found the missing money. Her remorse was poignant and loudly expressed. 'To think,' she cried, 'that I should have accused a gentleman like you of robbing a poor old woman of her savings! I'd loike soine to do you a bit of a koinddness, just to make up. Now, wouldn't you'—very persuasively—'come round to our little place and taste the case of whisky my husband "found" on the wharf last night?'

The day after that on which her husband died—he had 'found' more whisky than his constitution would stand—she called upon us again: 'Yes,' she said sadly, 'he's gone. Poor Mike. He was a good man. Then brightening up, she added: 'But anyway, I'm all right; for, do you see, there's Teddy Rooney down in Little Dublin dead-broke on me, and I needn't be a widdy a day longer than I like.' With which cheering reflection she took her leave.

C O L U M B U S.

I know not rightly whether bard or sage
Hath ever moralised upon his name;
And yet 'twas well, for like a giant came
His soul, the mightiest in a stalwart age,
Bearing the Christ across the water's rage.
And though succeeding ministers of shame
Belied their King of Peace with sword and flame,
Yet we are fallen upon a lovelier age,
When the West stretches out its filial hand
To bless the Old World on the Eastern shore,
And crowns with endless fame that Christopher
Whose sacred burden ever more and more
In links of mutual love and common care
Doth bind the Sunset with the Orient strand.

PRICE 1½d.

INDISCRIMINATE CHARITY.

ON a bright summer day a short time ago, as an employer of labour was driving through Charlton, in Kent, on his way to London, he observed a poor man lying down by the wayside in a state of apparent exhaustion. Getting down from his trap, he elicited from the man that he had walked from Chatham that morning without food, and was on his way to the metropolis in search of employment, having been discharged from the Chatham dockyard a few weeks previously. After putting a few questions, the replies to which were satisfactory, the gentleman presented the poor fellow with half-a-crown and directed him to finish his journey by train from the station close by, giving him at the same time his card, with instructions to call on the following morning at the place of business pencilled thereon, when there might possibly be employment for him.

The next day passed without the man appearing; but on the following morning a gentleman from Bromley called and, producing the card, stated that the party in question had waited upon him seeking assistance, presenting the card as evidence of the *bona fides* of his recommendation; and that, giving him a shilling and leaving him in the hall while he directed some food to be taken to him, he found on his return that the fellow had decamped, carrying with him a great-coat and a silk umbrella.

At the time of this occurrence there existed much penny and want, owing to a number of people being out of employment, and this evil, instead of diminishing, has steadily increased; but while it is to be deplored that so much misery and destitution should periodically prevail throughout the land, it cannot but be admitted that many claims upon public sympathy, and upon the purse of the charitably disposed, are frequently preferred by persons of questionable character and unworthy of relief.

The country swarms with professional mendicants and tramps, many of whom are born and brought up to the business; the majority, how-

ever, proceeds from a class of improvident people, who, while they profess to be anxious to obtain employment, invariably indulge in the idleness of poverty in preference to the performance of such labour as would supply their more immediate necessities. All attempts, hitherto, to dispose of this pestiferous class or to keep it within proper limits have proved abortive. The labour-test in the vagrant wards does not trouble them, for they are too cunning to avail themselves of the guardians' hospitality.

Let any person, for a change, in preference to spending a holiday at the usual seaside resort, take a walking tour through the country clad in professional tramp costume, living as they live—omitting the mendicancy—frequenting the places they most abhor, domiciling in the 'padding kens' they nightly patronise as they pass from place to place in the round of their nomadic life, and he will be amply repaid by the knowledge he acquires for the temporary inconvenience and discomfort he must necessarily experience.

Great facility is afforded to their operations by the possession of a hawker's license. Armed with this authority, which is procurable for five shillings, and provided with either a few sheets of writing-paper and envelopes, which they term their 'book,' several cards of buttons, or a common comb or two, to which may be added a knowledge of the words of a couple of Moody and Sankey's or Salvationist hymns—tunes desirable, but not indispensable—as a cloak to their mendicancy, they can generally baffle all attempts of the police at detection. Giving Tuesday until Friday to working small country places, they bestow their patronage on the towns on Saturday, Sunday, and Monday. By intercommunication, few of them are unacquainted with the merits and demerits of the different poorhouses on their circuit, and know pretty well where to choose a hospital or infirmary, into which, by artistic preparation, they can obtain admission, and pass the winter comfortably should business prove slack. Their hardihood and persistence are somewhat remarkable, although not always attended with success.

'Och! shure,' said a female Hibernian, on hearing the charitable acts of a worthy priest highly eulogised, 'I must go and see his riverence;' and calling upon him with a piteous tale, she managed to obtain the loan of a shilling; and a month later, on arriving at the same place in the order of her route, she waited upon him 'to pay back the money so kindly lent in me thrubble; and shure, your riverence, if I could only get some good Christian to loan me a few shillins for a while, it wud be the makin' of me wid the haukin', so it wud.'—'Well,' said the reverend gentleman, 'here is the shilling you have so honestly repaid. I will give you that towards it; but don't trouble me again.'

To bestow food or clothing upon this class is mistaken charity. The former is only an encumbrance, to be got rid of at the first opportunity; and the latter is of no use unless available for the pawnshop.

'I don't want bread—I want coppers,' said a sturdy beggar the other day in the neighbourhood of Liverpool, as he threw the proffered bread into the street; and the act attracting the attention of an observant constable, was rewarded by him with a free pass for a night's lodging at the police station.

In the counties of Gloucester and Hereford, a rule was in force, a year or two ago, by which tramps were required to apply at the police station for a ticket, on which were inscribed their name, age, description, and destination. This ticket was accompanied, on its issue, by an order for a night's lodging and a pound of bread, and was also endorsed for another town on the tramp's route, some ten miles further on, for the following night, where he would receive similar accommodation and allowance, and so be passed from town to town till clear of the county.

'Will you be kind enough to tell me how far I am from Aldershot?' inquired a decent-looking young fellow, a few months ago, of a gentleman who was walking in the neighbourhood of Cheltenham. Expressing his surprise at such an inquiry at such a distance, he put a few questions to the young man, and gathered from his replies that, being out of work, he was on his way to Aldershot, in order to enlist in a regiment in the camp there, in which regiment he had a brother serving Her Majesty.

Explaining to him that it was not necessary to walk such a distance to accomplish his purpose, and instructing him how to proceed, the gentleman gave him a shilling, on its being intimated to him in a quiet way that the military aspirant had not the necessary funds for his night's lodging. About three weeks after, the same gentleman was accosted by the same man in the vicinity of Gloucester, requesting to know if he was on the right road to Aldershot; and it is more than probable that the same individual is still inquiring his way to that military station.

Should a strike or unusual depression in trade occur in any locality, creating a call upon the charitable, to that locality will these human vultures flock, and ruthlessly thrust aside those for whose benefit the bounty is bestowed, in order themselves to prey upon the spoil.

Another class which preys upon the charitable consists of the families of the disreputable drunkards and loafers who are invariably to be found

in certain districts in every town, and who have no idea of earning a fair day's wages for a fair day's work; who, in far too many instances, maintain their worthless existence and satisfy the craving of their depraved appetites out of the proceeds of the wife and family's labour. These are men who, sunk in degradation through their own vices, would still loaf and idle even if there were employment for every working-man. Upon the families of these men charity is ill bestowed.

We have next a class of improvident people, with which all our large towns abound. No matter how brisk trade may be, they are never able to make both ends meet. When work is in full tide, no provision is made for any future contingency. The greater part of the husband's earnings passes into the publican's hands weekly. The wife pays her regular weekly visit on the Monday to the pawnshop to pledge, and on the Saturday to redeem. She patronises every travelling draper from whom she can obtain goods, the greater part of which finds its way to the pawnshop. She runs a weekly account for groceries and provisions at some small shop. Enter the house at any time, and the waste of food perceivable is almost incredible! There is not a charity in the town with which she is not acquainted, and from which she is not a recipient. Every charitably disposed person is a fair object for her operations, and the parish relieving officer is not free from her attacks. Her tale of misery is never ended, and her demands are insatiable. Let her but once enlist your sympathy so far as to obtain a pair of old shoes for her youngest child, or an old frock for her eldest girl, and from that moment your wardrobe ceases to be under your own control, and the rapacious demands to satisfy real and imaginary wants increase to an alarming extent.

'I'm sure I beg your pardon, sir,' from a female suppliant at the time of an epidemic, 'but you've been so kind during my husband's illness, that I make so bold as to ask if you will help me with a trifle towards his funeral.'

'Why,' was the reply, 'I thought your husband was in a Burial Club?'

'So he was, sir; but you see we got behind in our payments, and it threw him out of benefit.'

'When did your husband die?'

'Well, sir, he's not quite to say dead; but we don't think he can live over to-morrow.'

And such illustrations might be cited *ad infinitum*.

Nevertheless, the fact is incontrovertible that throughout the country misery and want are rife; and as the ranks of the unemployed are daily recruited by foreigners and the refuse from other lands, the demands at the most inclement season of any year will not be trifling.

Britain has never failed to respond to the cry of the wretched and the suffering either at home or abroad, and it is to be hoped never will; but it is desirable to prevent as much as possible the relief intended for the deserving poor from being appropriated by the undeserving and vicious. Misery that presents itself in appalling forms, openly to our view, is calculated to enlist our sympathy and aid, rather than that which remains unseen. The sturdy wooden-legged crossing-sweeper who stood in former years near London Bridge, and could afford to spend ten shillings

per day on his favourite brandy; the well-dressed children who, as clever violinists, a few years ago reaped a golden harvest under George Stephenson's monument in Newcastle-on-Tyne, while their disreputable parents lurked in the neighbourhood waiting to clutch the receipts for drink; the old widow Nanny Blain, who for twenty years received parochial relief in Scotland, and was buried at the expense of the parish, who lay with one hundred pounds in notes, and no end of silver coins, concealed in her bed; the miserable wretches with hired babes who prowl our streets for alms; the wretched match-selling children who haunt the places of public resort; even the urchins who vend the evening papers, and dare not return to their wretched homes without the amount necessary to satisfy their unnatural parents—these, and scores of other cases, have all in their turn excited our compassion and demanded our aid.

Wherever charity stretches forth its hand there will it be abused, and a great point for consideration is, how to reduce the abuse to a minimum.

'The poor ye have always with you,' were the words of the Great Teacher; but the deserving poor are not always to be found by the wayside begging. The class which loudly calls for sympathy and aid is of no blatant kind, but rather conceals much of its want and misery from public notice; when article after article of clothing, and even the very furniture, down to the poor bed itself, have been parted with to supply the commonest necessities of life. The husband has probably travelled many a weary mile day after day, legitimately seeking for work, only to return at nightfall to his poverty-stricken home with hunger gnawing at his vitals and despair in his heart. This class requires much searching out, and often when face to face with those who fain would relieve, make the most of their miserable surroundings in order to conceal their poverty. Indiscriminate alms-giving should be avoided and organisation adopted; not the organisation which requires elaborately furnished offices and a heavy staff of paid officials, but that which consists of benevolent individuals who have time at their disposal, and the heart and means to give, co-operating with each other.

In a northern town, one winter, forty railway trucks of coal were distributed amongst the poor by ticket, each ticket entitling the holder to thirteen hundredweight. Five-sixths of these tickets were sold by the recipients for a couple of shillings to the small coal-dealers and others. This abuse might have been avoided by the ticket simply authorising the holder to receive one hundred-weight per week for a certain number of weeks.

Soup-tickets are often obtained by shopkeepers in low localities, avowedly for distribution, but in reality for retail sale. Blankets find their way to the pawnbrokers. A benevolent Scotch lady once suggested that these should be procured in two separate colours, and the blankets divided down the centre, and the half of one colour neatly attached to the half of the other, thus answering the purpose of the gift or loan, but rendering it valueless as a pledge.

In all cases, the assistance afforded should be adapted to the circumstances of the case, and wherever possible, assume the form of a loan in preference to that of a gift. Money should

demand an equivalent of labour in some shape or form: an outhouse whitewashed, a stable cleaned, a fence mended, and a hundred other ways. Organisation could provide common material for shirt-making at proper prices by starving seamstresses, even if the articles were subsequently sold at a loss or given away. In any case, let something, however simple, be required in return, and so indiscriminate charity would be largely avoided.

JOHN VALE'S GUARDIAN.

CHAPTER V.

It happened on that particular morning that an unfortunate who was pretty constantly in trouble was seated at his desk at the very bottom of the class, and as far away from the fire as the confines of the room would permit. He was a gaunt and bony boy, who wanted a prodigious deal to eat, and rarely got it, his guardians being of opinion that it was well to teach children to repress their fleshly appetites early. He was a boy who grew very fast—which perhaps accounted for his being so constantly hungry—and there was always a *lacuna* between the bottoms of his trousers and the tops of his highlows, whilst his jacket was never within a size or two of his needs, so that his great red hands and bony wrists stuck out beyond his sleeves. He was a cold boy—he thought for his own part that insufficient nutriment left his circulation languid—and being at the farthest corner from the fire, he essayed to warm himself by a surreptitious beating of his limbs. Mr Macfarlane's desk stood beside the fire, and Mr Macfarlane was comfortable enough to make this behaviour on the boy's part seem scandalous.

'Jenvey,' said Mr Macfarlane, 'you are warned.'

The bony boy went quiet, and tried secretly to warm his fingers by blowing upon them from a distance, but met no great success. By-and-by Mr Macfarlane, turning away to tweak another boy's ears, Jenvey saw his chance, and began to beat his shoulders with his tingling fingers, whilst he kept a keen lookout on authority. Authority was one too many for him; the ear-tweaking had been no more than a cunning ruse, and when Macfarlane turned suddenly round, there were the guilty Jenvey's arms going like windmill sails. A frantic plunge to stop midway, and to assume an air and attitude of profound study, bettered the case from Macfarlane's point of view, inasmuch as it sent a leaden inkstand flying from the desk to the floor.

'Jenvey,' said Mr Macfarlane, softly and persuasively, 'come out, sir.'

Jenvey, ruefully sucking his chilled knuckles, numbed by their sudden contact with the inkstand, came out, filled with dire forebodings.

'You were warned, Jenvey,' said Mr Macfarlane regretfully and politely—'you were warned.' Jenvey knew his ways, and came on with the forebodings deepening. The schoolmaster took

up the bamboo from the desk, and gave a firm resounding slap with it, to quicken Jenvey's lingering footsteps and encourage him. 'Now, sir, will you be so kind as to explain this conduct?'

'I was cold, sir,' said the wretched Jenvey; 'I'm always cold, sir.'

'You will not be cold,' returned Mr Macfarlane with a soft reflectiveness—'you will not be cold, Jenvey, in a little while from now.' Jenvey gave a short sharp yelp, as if to say he knew he wouldn't, but on the whole would prefer to be; and the schoolmaster, taking a business-like grip of the jacket collar with his right, raised the dreadful left with the bamboo in it. 'Now, Jenvey,' said Mr Macfarlane, 'you know that this hurts me as much as it hurts you, but'—

'It's a lie!' bleated the desperate Jenvey.

The whole schoolroom was silent for a moment. The boys were petrified with astonishment and fear, and the schoolmaster himself was frozen by the impious horror of this rebellion. In the middle of this awful stillness, a laugh sprang up, a wild excited ringing laugh.

'Vale!' cried the schoolmaster, 'you dare to laugh at this unparalleled and shameful affront?—Stand up, sir.'

But Vale laughed the more, for the luckless Jenvey was his next-door neighbour and a chum, and overwrought sympathy and terror had already brought him to such a state that Jenvey's unexpected outbreak had thrown him into a sort of hysteria.

'Stand up, sir!' thundered Macfarlane, and the voice of power was strong enough to frighten hysteria away and to silence the shrieking laughter. 'Take your place upon that form, sir; I will attend to you directly.'

John obeyed. He could not have told, to save his life, what he had laughed at, but he knew that he could not have helped it. He was very pale, and his breath was troubled.

'Now, Jenvey,' said Mr Macfarlane. It was a brief exordium, and Jenvey could have wished it longer, not being yet learned in that philosophy which teaches that where an ill is unescapable, it is best to have it over. And whatever want of faith the ill-starred youth was conscious of in regard to Macfarlane's inward sufferings, he would have admitted, if it had been put to him, that the schoolmaster's prophecy had come true, and that he was not cold any longer. Macfarlane certainly bore his own pangs like a hero, and bated none of them. It sounded from outside as if a savage tribe had turned carpet-beaters, and timed the service with war-whoops. The most pressing sense of duty could not sustain Mr Macfarlane's powers for ever, and he found his strength failing him. The spirit was still willing, but the flesh was growing weak.

If everybody had not been so entranced by the excitement of the scene it might have been known earlier that a loud and exigent rapping sounded at the schoolroom door. As Jenvey grew hoarse and Macfarlane grew tired, the noise from without

grew louder. Then it ceased suddenly, the door was thrown violently open, and Isaiah appeared in the doorway. The schoolmaster let fall his uplifted arm and looked magisterially at the intruder.

'I'm sorry to spoil sport,' said Isaiah. Whether he were serious or satirical, his face showed nothing. 'You can finish when I'm gone, sir, if there's anything left to do. I want Master Vale at once.'

'Master Vale, I am sorry to say,' returned Mr Macfarlane, 'is at present in disgrace.'

'Well,' said Isaiah, 'he'll have to come out of it. We've just got news as his father's asking for him, and'—The rest of the sentence was whispered into Macfarlane's ear, Isaiah sheltering the whisper with his hand.

'Vale,' said Macfarlane, 'you are wanted at home.' John seemed to take no notice of this statement. It appeared, indeed, as if he had not heard it. 'You are wanted at home, Vale. Do you hear?' cried Macfarlane.

'What hast done to the lad?' Isaiah demanded, seeing that John stood still upon his form with an altogether vacant air.—'John! Master John! you come along with me; you're wanted. Your father's asking after you.'

'This is obstinacy,' said Macfarlane.

'It looks a good deal worse than that to my eye, gaffer,' Isaiah answered. He made his way to where John stood, and taking him up in his arms, bore him to the middle of the schoolroom and set him down before the fire. The wretched Jenvey was still moaning and whining, and was rubbing himself with many contortions. When he had rubbed for a second or two at one place, he seemed suddenly to remember another, and transferred his attention to that with an exasperated feeble yowl like that of a frightened cur.

'Never mind, Jenvey,' said John with a face strangely grave.

Jenvey left off rubbing and stared at him in mere amazement. The schoolmaster was puzzled and troubled; but Isaiah put an end to the scene by taking the boy's hand in his own and leading him away. Caps and overcoats and satchels were hanging up outside the schoolroom in a little corridor, and selecting John's belongings, Isaiah helped him to put them on, and led him into the street, through the long narrow playground and past the big green-painted gates. There stood the tall trap, with a small boy at the horse's head; and Isaiah, having given the boy a penny, lifted John into the trap, mounted after him, and drove away with many sidelong glances at his charge.

'Has the school-gaffer been beating you?' he asked, stooping sideways towards him.—John shook his head.—'Then what's put you into this state?'

'He beat Jenvey,' said John, breaking silence for the first time.

'Well, yes,' said Isaiah; 'he certainly did beat Jenvey.—What did he do it for?'

'Jenvey broke an inkstand,' John answered. The open air and movement were restoring him, but he spoke in an odd dream-like way. 'Then Mr Macfarlane called him out. Mr Macfarlane said it hurt him as much to punish Jenvey as it hurt Jenvey to be punished, and Jenvey said it was a lie.'

'That was it, was it?' asked Isaiah. 'Jenvey'll

grow wiser by-and-by than to show his wisdom.—But what made you fret so about seeing Jenvey catch it?

'I don't know,' said John. 'It makes my head swim; everything turns round, somehow.'

'That's how it is, is it?' Isaiah responded. His features did not lend themselves readily to the play of any emotion, but he looked often towards his young companion, as if he were disquieted. There was silence between the two for the space of perhaps a mile.

'Where are we going, Isaiah?' John asked him then. 'Are we going to father's?'

'Yes,' said Isaiah; 'that's where we're agoing to. We're agoing to your father's, Master John.'

Then there was another silence, and now, in place of Isaiah looking at him, John often looked at Isaiah; but he was busily intent upon the horse, and seemed to have no attention for anything else in the world.

'What are we going to father's for?'

'What are we agoing to your father's for?' Isaiah repeated, with that elaborate air of frankness which some people assume when they have anything to hide. 'Why, I suppose we're agoing to your father's because your father sent for you.'

'Do you know why father sent for me?' asked John.

'Why,' replied Isaiah, turning round to look more frank and open than before, 'because he wants to see you.'

'Yes,' pursued John, frightened by Isaiah's manner without knowing why. 'But what does he want to see me for?'—Isaiah hesitated, and looked confused.—'Is there anything the matter?' cried John.

'Well, in a way therer is, Master John.'—The boy laid hold of his coat sleeve and looked up at him.—'Your father's been rather badly hurt this morning, and he wants you at home. A chain broke, somehow, at the mill, and a sack of flour fell on him.—Come, come, Master John; he won't like to see his little b'y aerying; he'll expect his lad to bear up and be brave; that's what he'll naturally look for.'

'Is he—much hurt?' the boy asked, pausing, as if he hardly dared to put the question.

'Well, from what James told your uncle Snelling, he does seem to be rather badly hurt,' returned Isaiah. 'A sack of flour is a weighty thing, you see, Master John, and falling from a height, it would do a deal of damage to anybody it fell on.—That's only natural, ain't it, Master John?' He spoke as if he vaguely expected the boy to find some sort of comfort in this; but if his own hard visage, enamelled with soap and weather, showed anything, he seemed to find but little comfort for himself in it.

'Will he die, Isaiah?' the boy asked in a terrified whisper.

'Dear, dear!' returned Isaiah, avoiding his eye again. 'What has put such a thought as that into your head? We've all got to die, Master John; but there's none of us as will die afore the time comes.'

'Did it strike him on the head, Isaiah?' John in asking this question put his hand to his own head; and Isaiah, transferring the whip from his right hand to his left, put his hand on the boy's

further shoulder before he answered, and patted him twice or thrice.

'No, no,' he answered after a pause, in which a keener observer than young John might have thought that he mistrusted his voice. 'It wasn't so bad as that. He happened to be stooping at the time, James told us, and the bag fell on his back. It was a nasty thump, of course, and they had to carry him home. James drove down to tell your uncle Snelling about it, and so your uncle Snelling went on ahead, and sent me to fetch you with word to follow.' When Isaiah had got as far as this, he began to recover himself somewhat. He continued with friendly cunning: 'A man of your father's age, Master John, can't get a blow like that without suffering a good deal from it.—Now you listen to what I'm saying, Master John, and try to remember it, because it's for your father's good, and what's for your father's good is for your own good. It's like enough that your father won't be able to tell at first whether he's bad hurt or no. If he sees you frightened, he'll think you've heard somebody say as he's hurt very bad indeed, and then, don't you see that may cast him down? So you must just be as brave and quiet as you can, Master John.'

'I'll try, Isaiah,' said John, sobbing and trembling a little; and Isaiah put the horse to his best speed.

John looked anxiously at the house when they came in sight of it, and saw that the blinds of his father's bedroom windows were drawn down. Hostler James stood at the gate, guarding the doctor's chestnut mare and Uncle Snelling's sorrel. Isaiah catching the hostler's eye, gave an almost gesture of the left thumb, indicating John, and executed a ghastly grin of warning.

'What' the news now, James?' he asked as he alighted and fastened the reins to the fence.

'Young master's wanted up-stairs,' James answered guardedly; and John entered the house and climbed the stair with so strong a certainty of the worst imprinted on his mind, that he often recalled it in after-years, and thought it strange. The corridor at the head of the stairs was dark, and he had to grope for the bedroom door. When he had found it, he knocked softly, and Dr Haycock came to open it. After the clear wintry sunlight without, with everything made bright and dazzling by a coat of dry powdery snow, the room looked dark, and John could only make out the great old-fashioned mahogany four-poster with its canopy and hangings of dark maroon as if it had been a cloud in twilight.

'Is that John?' his father's voice asked faintly. He knew the voice, and yet it was strangely altered; all the manhood had gone out of it, and it was weak and low. 'Bring him where I can see him.'

This request and the gloom of the chamber and the silence of the dim twilight figures there all seemed like a continuance of the dread certainty which had fallen upon the boy in the darkness of the stairway. Uncle Snelling's great bulk reared itself beside the bed on the far side. The housekeeper stood on the near side, her white cap a little clearer than other objects against the dark bed-curtains; she took young John by the hand. Why so gently, unless that awful sense of certainty were true?

'Put him on the bedside,' said the farmer.— 'Give me a kiss, lad. I'm glad thee gottest here in time.'

There was the certainty again, but John stooped and kissed his father without a sob or a tear. He found his cold hand, and held it in both his own, fondling it softly, as if he had been the elderly man and the sufferer had been the child.

'It's a mercy I'm in no pain,' said the farmer in that changed voice. 'I should ha' thought a man would ha' suffered.' He paused for a time and then called 'Robert.'

'Well, John?' asked Snelling, stooping over him.

'You'll find everything straight and orderly. You'll be sole executor, and John's guardian until he's twenty-one. I've left you a thousand pound in ready money, in testimony of our friendship and the esteem we've had for one another.'

'Thank you, John,' said Snelling; 'I take it kindly of you. I've neither chick nor child of my own, and John will get it again when my time comes, and something to the back of it.'

'The rest,' said Vale, 'goes to John. I leave him to your charge, Robert. You've been good to him always; but now you'll have to stand for everybody. He's got nobody else i' the world. Be good to him, Robert.'

'Make your mind easy on that score, John,' Snelling answered; 'he shall be taken care of.'

'It's a great blessing to be out of pain,' said the farmer after a long interlude of silence. 'I should ha' thought a man would ha' suffered more.'

Young John heard, saw, and noted everything that was to be seen, heard, and noted. He was aware of no unusual interest, and yet he remembered years afterwards the position and aspect of things about the room.

'You'll find yourself remembered, Mrs Herrick,' the farmer said, turning his eyes upon the house-keeper. 'So will James.'

Except his eyes and his pale lips, not a feature stirred, and his head and limbs were as immobile as if he had been dead already. The eyes rolling round the darkened chamber, and the face otherwise motionless, frightened the boy, and he clung tightly to the cold hand he held. The eyes turned towards him.

'Kiss me again, lad.—Good-bye. Be a good lad, John.—You'd better take him down-stairs, Mrs Herrick.'

'No, no,' John besought him in a whisper.

'Let the lad stay,' the dying man said feebly. 'Poor little chap. I'm all that's left him, and he won't have me for long.'

Snelling, moving noiselessly, crossed to the doctor, and whispered to him. The doctor shook his head, and the two stood side by side in the twilight looking down. Suddenly the farmer spoke out clear and loud: 'Robert, you'll do your duty by him?'

'Make your mind easy about that, John,' Snelling answered. 'I shall do my duty by him.'

With that Vale sighed and closed his eyes, and the elders looking at him saw that his chin had fallen. The housekeeper took young John by the hand and led him away. He knew as well as she did what had happened, and wept bitterly.

He had good reason to weep, being thus robbed of that kindly father; but if he had seen into Uncle Snelling's mind, he would have found a better reason still.

(To be continued.)

OVERLAND TO INDIA IN 1789 AND 1889.

It has long been a common thing for novelists to seek material for their pens in depicting the marvels and wonders of which the year 1900 A.D. will be the witness. The pen of Lytton has described for us the 'Coming Race,' and other writers have exercised their ingenuity in picturing the circumstances by which that remarkable people will be environed. Submarine vessels, self-steering air-wagons, the utilisation of the central fire, are only some among the many marvels which the end of the twentieth century will, according to them, employ as every-day mediums. It is not, however, our present purpose to add to these annals of prophetic fiction; but to go back in spirit, and see some of the ways and means of our forefathers even a short hundred years ago.

A weekly mail, and, in an emergency, the cable, has been so long familiar to us, that it is difficult to realise that India is really four thousand miles away; while, thanks to Indian Museums and Colonial Exhibitions, it is no longer to us the land of marvel that it was to our forefathers. In a general way we know and realise that Columbus, Cabot, Magellan, and Drake found travelling no very easy thing; but they are out of our sphere and age, and we cannot fancy ourselves in any way like them. India of to-day is a thing that we understand. It is a little out of the way; but one can take a return ticket to it as one would from Baker Street to Gower Street, spend six weeks upon its shores, and return home to keep an engagement not quite three months old. It is a little pleasure trip in which one experiences in reality little more discomfort than would be one's lot in a journey to Switzerland. The traveller can time himself to a minute. Sixty hours to Brindisi, three days to Alexandria, ten days from there, and the journey to Bombay is an accomplished fact.

Such is the overland route of to-day; but such was not the overland route of 1789. In that year, Major John Taylor of the Bombay establishment, partly for private reasons, and partly on behalf of the Honourable East India Company, decided, as the sea-route via the Cape was ineligible at that season, to proceed to India by an overland journey, via the Tyrol, Venice, Scanderoon, Aleppo, the Great Desert to Bassorah, and the Persian Gulf. His companions in this most arduous undertaking were Mr Blackader, also of the Company's service, and Mrs Taylor, who intended only to proceed as far as Venice, but who eventually elected to follow her husband to India. The first and most necessary item of the outfit required for the journey, and upon the worth of which the Major lays great stress, was a strong travelling coach, completely fitted up. To us of to-day it is difficult to understand the meaning of the term, unless one takes for a model that famous carriage of the First Napoleon which was so familiar an object to our young eyes in the showrooms of Madame Tussaud. To this, besides the necessary changes

of linen, were added two pair of pistols and a gun 'with the necessary apparatus;' portable soup, tea, a medicine chest; some maps of the countries through which they were to pass, a compass, a spyglass, a sextant, and some phosphorus matches. Two servants accompanied the party—one a native of Bengal, and the other a European, who could talk both French and German.

A start was made from London at 10 A.M. on the 22d of August 1789, and Ostend was reached in twenty-eight hours. Fast coach-travelling leaves little time for observation of scenery or people; but in the Major's notebook we find remarks upon the different places at which they stopped, which read strangely now. The approach to Aix-la-Chapelle is described as 'unspeakably bad;' at Cologne the accommodation seemed tolerable; but the travellers were detained there all night, as the gates of the city were closed immediately after their arrival, and were not opened till next morning; they therefore slept all night in their coach, so as to be able to start at an early hour next morning. Nassau is 'poor and ill built;' while near it are described the hot springs of 'Embs,' which, however, 'were not much frequented,' as the more fashionable attractions of Spa drew away all but those whose slender purses made the last place inaccessible. At Worms they were again obliged to sleep in the coach during heavy rain. Incidents such as fording rivers, passing dangerous mountain defiles with a wall on one side and a precipitous gulf on the other, are common. Although they make light of the bad accommodation and food they met with, they complain bitterly of the bad roads, of the inefficiency of the drivers, and of the want of post-horses. At almost every town they lost time waiting for relays of horses, and had to submit to the extortion and insolence of the postmasters. For two days they travelled behind the carriage and suite of the Polish ambassador to the Porte, who of course monopolised all the fresh post-horses, and left behind him his jaded cattle for Major Taylor's use. At Trent, to avoid this, he changed his route, and thus got ahead of the ambassador, and reached Venice twenty-four hours before him. The total distance from London to Venice (ten hundred and fifty-two miles) was accomplished in seventeen days, and at a cost of two hundred and fourteen pounds three shillings and sixpence.

In the city of the Doges the party was detained from the 8th until the 17th of September before they could secure a vessel to proceed down the Adriatic. However, after many wearying delays, they embarked in a small brig, whose master agreed to conduct them in safety to Cyprus, the passengers finding themselves in everything save water, fuel, and fire; and to defray their passage they were to pay the captain the sum of seventy-one pounds and tenpence, and further to make him a present according to their generosity and to the attention they received on board his ship. That the comfort and speed of the journey were not great, we may infer from the earnestness with which Major Taylor urges his friends never, in a like emergency, to engage with a Slavonian. Here, enraged with these needless delays, they attempted to leave the ship and to engage with another. This plan the captain attempted to frustrate by refusing to allow them to disembark.

However, this was finally accomplished, and Zante was quitted on the 14th of November, an English vessel bound for the Levant having opportunely made its appearance; and the party landed at Scanderoon on the 28th. From here they rode to Antioch under the protection of parties of Turkish soldiers placed along the route to protect travellers from the extortions of various neighbouring pashas; and they entered into that ancient stronghold of Christianity after two days' journey. Of the inhospitality and hostility of the Antiocheans, Major Taylor speaks bitterly; and when they finally got away, the party, by the advice of a friendly Armenian, walked to the outskirts of the town, to avoid wounding the susceptibilities of the natives, who would not allow to Europeans the dignity of mounting on horse-back within their gates.

From Antioch, their way led to Aleppo—which our traveller enthusiastically describes as a flower-surrounded city rising from the bosom of a desert—and thence to Bassorah across the Great Desert. Major Taylor engaged a caravan for his party at a cost of three hundred and thirty-three pounds six shillings and eightpence, by which they were allowed fourteen camels for the tents, baggage, &c., besides those for their own riding. Thanks to the intelligence of their escort, the usual troubles to be expected from hostile sheiks were avoided or compromised by presents; and after thirty days' march and the endurance of many discomforts and privations, they entered Bassorah. Here they rejoiced to see the British flag flying over the house of the Resident, who received them cordially. The comforts they here enjoyed, the fruit which abounds in that district, appeared to them, after their many and arduous trials, the height of luxury. On the whole, their journey through the Desert was a quick one; for, though Major Taylor allows that, mounted on a dromedary like his Arab guide, and travelling express with no encumbrances of tent or baggage, a man may cross the Desert in thirteen days, yet he judges that few Europeans could stand the fatigue and exposure.

At Bassorah they were not exposed to any needless delay, for the cruiser *Intrepid*, belonging to the Honourable East India Company, was fortunately in the bay; so the party promptly embarked for Bombay, and, after one or two contretemps, reached their destination, after a passage of twenty-one days, on the 23d of February 1790; thus making a total of one hundred and eighty-six days from London. The entire cost of this journey for the three travellers and their two servants was thirteen hundred and twelve pounds eighteen shillings and threepence.

Such is a brief sketch of what our great-grand-fathers underwent who tried the overland route to India just one hundred years ago; and on the whole, Major Taylor and his party were very fortunate. Five years previously, a party of gentlemen had essayed to return from India by this Bassorah route, and on their arrival in that city, found the Desert to be reported by the natives in so unsettled a state, that they changed their line of march, and embarked upon the river. Euphrates, to Hillah, thence to Bagdad, and so to Aleppo. They divided their numbers; and the first party, under protestations of friendship and promises of escort, were cruelly murdered by the

Arabs. The second band, warned by signs and symptoms of excitement among their treacherous allies, only saved their lives by their determined attitude; and after numberless escapes from worse than death, arrived in Marseilles twenty-one months after their departure from Bombay.

Though Major Taylor could hardly deem his experiment a success, he was too much impressed with the necessity of finding an expeditious route to India to be discouraged by his failure. In 1789, France was threatening the safety of our Indian possessions. The Eagle was striving to rend from the Lion this important and valuable prey. So Major Taylor argued that India would be attacked through Egypt and the Red Sea, and urged that British supremacy should be maintained in these parts at any cost. Keeping this, then, in his mind, he next records his journey to England via Suez, which journey he computed could be done in the most expeditious manner and in the most favourable season in sixty-five days eight hours. To effect this, he advocated that an agent should be established at Messina with relays of boats to forward despatches to Alexandria; that from thence the consul should forward them by native messengers to Suez; that they should be conveyed from there to Mocha by relays of country-boats, for whose safety armed vessels should be maintained in the Red Sea; and that at Mocha one of the Company's cruisers should be in waiting to sail at once for Bombay.

Such was the quickest means that could be devised a century ago to communicate between England and India; and it must be borne in mind that sixty-five days could only hold good in the most favourable season of the year, and without regard to the numberless delays that might arise where so many changes and different bearers were necessary. For the expenses of this journey for a single gentleman travelling without a servant, Major Taylor found by experience that it could not be done for less than one hundred and fifty pounds. As for letters and packages from India to England, the scale of charges was in 1793 as follows: two ounces, four rupees (eight shillings); three ounces, nine rupees; four ounces, sixteen rupees; five ounces, thirty-five rupees.

But this or any overland route to India was in 1789 practically closed to any but the Livingstones and Stanleys of their day. It was an arduous and difficult undertaking, full, as we have seen, of perils by land and sea from robbers and pirates. It bore no more likeness to the overland route of to-day than did the pilgrims upon which our great-grandmothers rode to church to Pullman cars. The difference is too great for us of the nineteenth century to draw a parallel. Let the reader who is unacquainted with modern improvements go down to the docks and inspect one of the magnificent Peninsular and Oriental vessels that weekly start for the East. It is absurd to say that they are merely comfortable, for many who travel by them experience more of luxury while on them than they have ever done before. From the electric light to chain mattresses, nothing is wanting to complete the comfort of passengers, and all responsibility for the voyage drops the moment the passenger sets foot on deck until he reaches Bombay.

Of the old sea-route—that is, the ordinary

journey round the Cape—it is needless to speak. Vile accommodation, worse food, and still worse water, and a journey that lasted indefinitely from seven to ten months, formed the sum-total that might be gathered from its logbook. Truly, if the old Company's servants reaped a rich harvest in India and shook the pagoda tree to some purpose, they deserved all they gathered. If, indeed, we are to judge of the future by the past, how shall we prophesy for the year of grace 1989? What will then be our position on the political map? We cannot tell; but no change that can occur will be as perplexing to us, could we then 'revisit the glimpses of the moon,' as would be the changes that have taken place during the last hundred years to our ancestors of 1789.

JEREMY YORK.

CONCLUSION.

EIGHT months have passed, and the scene is now on the broad equinoctial ocean, with the fiery atmosphere of the Antilles in every cat's-paw that tarnishes the polished heaving mirror let the faint air blow whence it will; a sky of copper brightening into blinding dazzle round about the sun, that at his meridian shines almost directly over the mast-heads, and transforms the vast spread of sea into a sheet of white fire, trembling into the blue distance faint with the haze of heat.

There was a small West Indiaman named the *City of Glasgow* that had been lying stagnated on these fervid parallels for hard upon four days. There was no virtue in awnings, in wetted decks, in yawning skylights, in open portholes, and the heels of windsails to render the atmosphere of the 'tween-decks and cabin tolerable to the people aboard the ship. The air was sickly with the smell of blistered paint, the brass-work was fiery hot, and took the skin off the hand that for a moment unconsciously touched it; the pitch was like putty between the seams; the fresh water in the scuttle-butts was warm as newly drawn milk, but quite without dairy fragrance. It was time, indeed, for the wind to blow. The mere detention was nothing in those pleasant times of groping. In cooler climes the mate would have been satisfied to whistle for wind for a month, and go below every time his watch was up with a feeling that he had done everything that was necessary, and that all was well. But the heat made an enforced resting-place off the Cuban heights insufferable.

It was half-past eight o'clock in the morning watch; the hands had come up from breakfast and were distributed on various jobs about the deck. There was not a breath of air; but there was a run of glassy folds from the south-west, which within the past hour had somewhat increased in weight; and upon these long-drawn heavings, the ship, that was a mere tub in form, as all vessels were in those days, saving, perhaps, the piratical *barco longos*, rolled as regularly as a pendulum swings, swelling out her canvas to one lurch, only to bring it in to the masts again at

the next with sounds like the explosions of nine-pounders in the tops.

The captain of the *City of Glasgow* was a small fiery-faced man, with deep-set eyes that gloved like cairngorms under the shaggy thatches of the brows, a nose that not a little resembled a small carrot both in shape and hue, and a mouth with a set of the lips that indicated a highly peppery temper. He walked to the mate, who stood near the wheel fanning himself with a great straw hat.

'When is this going to end, sir?'

'I don't know, sir.'

'Blood, sir! Is there no limit to calms? Thunder and slugs! If this goes on, we must tow—d' ye see, *love*, I say—get the long-boat over and crowd her with men. What though they frizzle? We must get out of this, or'—

He was probably about to launch into a piece of profanity, but he was interrupted by a cry coming down from aloft, delivered by a man who had been sent on to the mainroyal yard to repair some defect that the vigilant eye of the boatswain had detected: 'Sail ho!'

The little fiery-faced captain started, and looked as if he scarcely credited his hearing; then running to the rail, he thrust his head clear of the awning and bawled up to the fellow, 'Where away?'

'Right astarn,' was the answer of the man, swinging with one hand from the tie as he pointed with the other directly over the taffrail to the gleaming haze of sea-line there.

'Well,' said the skipper, 'that should be a sign there's wind somewhere about.'

'It is some craft,' said the mate, 'that may be bringing a draught of air along with her.'

'Don't talk of a draught of air, sir,' said the captain passionately; 'what we want is wind, sir, a fresh breeze—a gale—a howling hurricane, by thunder! H'an't he had enough of cat's-paws? Draught of air!' he muttered under his breath with a look of loathing in his eyes as he made them meet in a squint upon the compass card.

But the mate was right on one side of his remark, at all events. What the fellow aloft had sighted proved to be a ship climbing the shining slope to the impulse of a breeze; but it was not until her royals were trembling like stars above the horizon, with nothing else under them showing, that the people of the *City of Glasgow* caught sight of the line of the wind darkening the waters in the south-west. In half an hour's time it was blowing into the canvas of the West Indianman, raising a pretty tinkling sound of running waters all around her; and though it came warm as the human breath, yet, after the long spell of hot and tingling calm, it put a sense of coolness into each fevered cheek turned gratefully to the quarter whence it came. If ever the crew of the *City of Glasgow* desired an illustration of the ponderous sailing qualities of the clumsy old castellated wagon they navigated, they might have found it in the rapid growth of the stranger astern. By noon she had risen to the reefband of her forecourse, with her flying jib yearning fair over the water-line. She was clearly making the same course as the West Indianman. Indeed, it took rather the form of a pursuit, for, when first seen, she was apparently heading to the north-west; but scarcely had the

West Indianman to the first of the breeze trimmed yards for the north-east, than the stranger was observed to also haul her wind.

The fiery little captain did not like it. What was she? A Spaniard? A Frenchman? A Dutchman? He packed on studding-sails, but to no purpose, for the fellow astern came along hand over hand, as though her crew were warping her up to a stationary object. Presently she was showing fair on the water, a big yellow craft, with great curling headboards and a double line of batteries. Then, when she was plain in view, puff! blew a white ball of smoke from a forechaser, followed by the dull thud of the distant gun; and a minute after, the mate, who was working away at her through a long perspective glass of the period, cried out that she had hoisted the Union Jack at her fore.

'Well, and what's that to me?' bawled the fiery little captain.—'Anybody observe if that gun was shotted?' There was no answer. 'What do they mean by shooting at us? Wounds, but it may be a trap! Hoist away our colours and keep all fast.'

Five minutes later, the stranger fired again; but observing that no notice was taken of the summons, she waited until she was within range, then, yawing, let drive with such good aim as to bring the West Indianman's mizzen topgallant-mast down with a run. The sight of the wreckage struck a panic into the soul of the little fiery captain.

'Down stun'-sails; man the braces!' he roared; 'bring her to, or he'll founder us.'

In a few moments the *City of Glasgow* lay with her foretopsail to the mast, docilely waiting for what was to happen.

It was not long before the ship had ranged alongside, and she then proved to be a great fifty-gun man-of-war, an Englishman on a West Indian cruise, with crowds of pigtailed heads looking over her bulwarks forward, and a quarterdeck brilliant with the quaint naval uniforms of that day—if, indeed, it can be said that any approach to a uniform was then established. A stout man in a cocked-hat, white silk stockings, handsomely laced coat, and a big white wig, mounting on to the rail of the man-of-war, clapped a huge copper speaking-trumpet to his lips and bawled out, 'Ship ahoy! What ship are you?'

The little peppery captain sprang on to a hen-coop and answered, 'The *City of Glasgow* of London, from Havana.'

'Keep your topsail to the mast; I'll send a boat,' cried the other.

'A boat?' cried the little chap, turning to his mate. 'What does he want to send a boat for? Does he question my papers?—Zounds! if there be any sort of law still going in the old country, I'll make him pay for that mess up there; and he sent a fiery glance at his topgallant-mast.'

The boat plunged from the man-of-war's side; a crowd of sturdy fellows armed to the teeth jumped into her; a young marine exquisite, with a hanger on his hip and a cambric pocket-handkerchief in his breast, his laced hat airily cocked upon his head, and a flash of jewels upon his fingers, took his place in the sternsheets, and with a few sweeps of the long oars, the boat was alongside. The dandy lieutenant stepped aboard.

'Why did you not heave to,' he exclaimed in an affected drawl, 'when you were summoned by our cannon?'

'How did I know what you fired for?' cried the irritable captain. 'Look how you've served me,' and he pointed aloft.

'Pon honour!' exclaimed the lieutenant, 'you deserve that we should have sunk you.' He applied the scented pocket-handkerchief to his nose, as though he could not support the smell of the hot pitch and blistered paint rising into the atmosphere from off the Indianan, and exclaimed in a voice as if he should swoon, 'Muster your men, sir, and for the Lud's sake be quick about it.'

The little captain fully understanding the significance of this order, was about to remonstrate, but seemed to change his mind on catching the glance that was shot at him from under the seemingly sleepy lid of the languid, perfumed sea-dandy, and repeated the lieutenant's order to his mate, turning sulkily on his heels afterwards, and starting off into a sharp fiery walk betwixt the binnacle and the mizzen rigging.

The boatswain's pipe shrieked to the silent hollows of the canvas aloft; the men stood along the deck, and the lieutenant with six armed seamen at his back fell to picking and choosing. The man-of-war wanted twenty men to complete her complement, and of these the Indianan must contribute ten. There was no help for it; and the little captain had presently the mortification to witness ten of his best seamen descend the side with their bundles and bags and enter the boat, which forthwith carried them aboard the fifty-gun ship.

One of these ten men was a tall handsome young fellow, whom no one who had before known him could have failed instantly to recognise as Jeremy York, spite of his assumption of the name of Jem Marloe, of his hair being cut short in front and rolled into a tail down his back, and of the hue of it, that had been a sunny auburn, being now whitened as though dusted with powder. He was the second of the ten men to step on board. It was not, only that he was the most conspicuous of them all by reason of his stature and beauty—for his frame had long since erected itself into its old manly port out of the stoop and depression of ill health; he was specially noticeable besides for an air of profound indifference. Most of the others glanced insolently and mutinously about them, savagely resentful of this imprisonment and of their liberty as merchant seamen being abruptly ended without regard to wages, to cherished hopes, to their homes, their wives, their sweethearts, their children ashore. A number of the ship's crew stood near the mainmast watching the new hands as they went forwards marshalled by the boatswain. On a sudden Jeremy York was seen to come to a dead stand with his eyes fixed upon one of these sailors; his bundle fell from his hand, his face turned to a deathlike white, shiver after shiver chased his form, they saw his fingers convulsively working, and his eyes, filled with horror, dismay, incredulity, seemed to start from their sockets with the intensity of his stare. They believed he was seized with a fit, and would fall to the deck in a minute; and amongst those who sprang to his assistance was the fellow on whom his gaze

was riveted. He shrieked out at his approach, and fell upon one knee trembling violently, swaying to and fro, to and fro with his hands pressed to his eyes in the posture of one wild almost to madness.

'Is the man ill?' bawled a lieutenant from the quarter-deck. 'If so, bear him below, and let the surgeon attend him.'

York staggered on to his legs, and looking at the man at first sight of whom he had appeared to have fallen crazy, he cried in a weak faltering voice, 'Your name is Worksop? You were bo'sun of a West Indianan.'

The other, full of amazement, with a slow bewildered stare at York and then round upon his shipmates, answered in a hurricane note, 'That's so: I ain't ashamed. My name's Worksop, and I was bo'sun of a West Indianan, as ye say.'

'Look at me!' cried York. 'O man, look at me! What have I suffered through you! Do not you remember me?'

Any one would have laughed outright to have witnessed the perplexity that lengthened yet the longdrawn countenance of Worksop.

'What's all this?' cried the lieutenant in charge of the deck, coming forward angrily.

'Sir,' shrieked York, 'I have been hanged for the murder of that man!'

'Mad, by Heaven!' cried the lieutenant: 'sun-stroke, no doubt. Take the poor devil below, and see to him.'

'Sir,' cried York, clasping his hands, 'I beg you to listen to me one minute. I am not mad indeed. Mr Worksop there will remember that one night more than eight months ago he gave me a share of his bed at an inn at Deal called the *Lonely Star*.'

Worksop started and looked intently at the speaker.

'I quitted the bed to get some water; when I returned, my companion was gone. Blood was found in the bed; there were bloodstains down the staircase, along the roadway to the beach; there was blood upon my shirt, although, as God is my witness, I knew not how it came there. They found his knife upon me, which I had taken from his pocket whilst he slept to prise open the door with; and also a gold coin belonging to him they found, though how I came by it I vow, before Heaven, I know not; and on this evidence they hanged me!'

He faltered, hid his face, and fell to the deck in a dead faint.

'Hanged him, *hanged him for me!*' shouted Worksop in the voice of a man about to suffocate. 'Hanged him for *me!*' he repeated. 'But, lor bless my soul and body! I was never murdered, mates!' and in a very ecstasy of astonishment, he hooked an immense quid out of his cheek and flung it overboard.

'Rally this poor fellow, some of you,' exclaimed the lieutenant, and hastened aft to the captain to make his report.

A bucket of cold water topped with a dram of rum served to restore York to consciousness; and when he had his wits, he and Worksop were conducted by a midshipman to the captain's cabin.

'What is all this?' inquired the gray-haired commander, levelling a piercing glance at York,

as though he had made up his mind to be confronted by a madman. 'D'ye mean to tell us that you've been hanged for the murder of yonder seaman alongside of you?'

'Yes, sir; I've been hanged as his murderer;' and thus breaking the silence, York proceeded. He told his story in good language, plainly and intelligently, with an occasional catch of his breath and a sob or two when he spoke of his sweetheart.

'You were hanged,' cried the commander, watching him with a fascinated countenance, for the corroborative looks and nods of Worksope as York delivered his tale had soon abundantly satisfied the captain that the poor young fellow was speaking the truth—'you were hanged,' he repeated, 'strung up by your neck in the customary style, I suppose, and left to dangle for the usual time. And yet you are alive!'

'I am coming to that, sir,' said York respectfully. 'Everybody was against me whilst I lay in jail awaiting my trial at the assizes; but after I had been sentenced to be hanged, there came a bit of a change in some folk's minds; not that they doubted my guilt, but they thought it hard, perhaps, that a young fellow should die for a crime he swore he had never committed—that he should suffer death on no stronger evidence than some blood-marks and a knife and a coin, when by rights they should have found the murdered man's money upon him, besides making sure that he *was* dead,' glancing as he spoke at Worksope, 'by the discovery of his body. Sir, my sweetheart got to hear of this feeling and worked upon it, and got a number of young fellows to hang about the gibbet and shore me up, as is often done, I'm told, after the cart had been drawn away. The rope was too long, my feet touched the ground—that's what they told me. It all went black with me soon after I felt the tightness in my throat; and when I recovered my mind, I found myself in a little cottage someway the Deal side of Sandwich, with my sweetheart, Jenny, kneeling by my side, and a Sandwich barber letting blood from my arm. What was then to be done, sir, being a live man, but to get out of the country as fast as I could? Jenny helped to disguise me, gave me all the money she had, having spent what the owners of my ship had sent her on a lawyer to defend me at the trial; and walking as far as Ramsgate I found a vessel there that wanted a man; and coming to the Thames after a coasting trip, I signed for the West Indianman out of which I have just been pressed. That's the truth of the story, sir, as Heaven hears me.'

Once again he hid his face, and his strong frame shook with a violent fit of sobbing. They waited until he had collected himself, burning as they were with curiosity to hear Worksope's story, for the solution of the amazing mystery must lie in that.

'And now, what's your yarn?' says the captain.

Worksope seemed to emerge with his prodigiously elongated countenance out of a very trance or stupefaction of astonishment. He wiped his brow, threw a bewildered look around, dried his lips, and began.

'Your honour,' he said, 'this is how it was; and I do hope Heaven'll forgive me for being the involuntary cause of this poor gentleman's most

tremendous sufferings. He comes to bed on that precious night all right, just as he says, and found me a bit growling and surly, I dessay, for the fact was, your honour, that same afternoon, unbeknown to anybody belonging to the *Lonely Star*, I'd called upon a barber that was a stranger to me to let me some blood for an ugly pain I had in the side; and when this poor young fellow came to bed, I was lying very uneasy with the smart of the wound the barber had made. Well, I fell asleep, but was awakened by feeling my side cold and damp. There was light enough coming through the window, as this young man has already told your honour, to throw things out middling visible; and with half an eye I saw that I was bleeding badly, and that if I didn't look sharp, I must lose more blood than I was ever likely to get back again. I dressed myself in a hurry, meaning to run round to the barber's house, that he might strap up the wound he had made in ship-shape fashion, just noticing, whilst I pulled on my clothes, that this young gentleman had left the bed, and was out of the room, though I scarce gave the matter a moment's heed, being too anxious to get the bleeding stopped to think of anything else. I bundled down the staircase, and as I arrived on the pavement, a group of men pounced upon me. They were a pressgang from the first-rate the *Thunderer*, lying in the Downs. I tried to make 'em understand my condition; but instead of listening, they turned to and gagged me, and carried me, dripping as I was, which they wouldn't take much notice of in the dark, down to a bit of a pier on the beach, tossed me into the boat, and put me aboard, where I was properly doctored after the wound came to be looked at. When I'd served two months aboard the *Thunderer*, they transferred me to a sloop, and afterwards drafted me into this here vessel, your honour; and that's the blessed truth,' cried he, smiting the palm of his hand with his fist, 'as I'm alive to tell it.'

'Did you miss the knife?' inquired the commander.

'I did, your honour, when I came to feel in my pockets.'

'And the Spanish gold coin?'

'I did, sir, to my sorrow. I had thirty-six guineas in cash; the money was all right; but I'd have given it four times over to have got that Spanish bit back again.'

'How do you account for your possession of it?' inquired the captain, addressing York.

'Why, your honour, I think I can explain that,' cried Worksope, before the young fellow could answer. 'I've no more belief that I was robbed of it than I have that I'm a murdered man. This will have been it, your honour. The blade of my knife was a bit worn, and there was a vacant length in the hollow of it when clasped. The coin must have got jammed into that vacancy. It would fit well, sir; mor'n once I have drawn out the knife with the coin stuck in it. There was nothen, I suppose, but the wish to keep that coin away from my other money that allowed me to let it lie in the pocket where my knife was.'

'A wonderful story indeed,' said the captain. — 'What is your name, my man?'

'Jeremy York, sir.'

'It will be my duty to put you in the way of

righting yourself with the law, that has most grievously sinned against you, at the earliest opportunity.—You can go forward, now, both of you.'

The captain of the man-of-war was as good as his word. On the arrival of the vessel at Havana, he sent York and Worksop on board a king's ship that would be sailing for home in a few days. Out of his own purse he presented the young man with a handsome sum of money; whilst all hands, from the first lieutenant down to the loblolly boy, subscribed dollars enough to handsomely tassel the handkerchief of the victim of circumstantial evidence. Further, the captain gave him a letter addressed to a relative of his holding an important official position at the Admiralty, in which he related York's story at large, and begged him so to interest himself in the affair as to contrive that the unfortunate young man should have his character thoroughly re-established, along with such reparation from government as influence could obtain.

The story is one hundred and thirty years old; time has blackened the canvas; one sees the singular picture but dimly, and such sequel as remains must be left to the imagination of the student of this blurred old-world piece. Yet tradition is not wholly unhelpful, for there is reason at least to believe that public emotion was sufficiently stirred by the representations of the broadsheets and prints of those days to result in a sum of money considerable enough not only to enable Jeremy York to marry his faithful sweetheart Jenny Bax, but to free the young man from the obligation of going to sea for a living, and establish them both in a snug business in the neighbourhood of Limehouse.

SWEARING-IN AT HIGHGATE.

ABOUT one hundred years ago the question, 'Have you been sworn at Highgate?' was one very frequently asked in all parts of the country. At that time this interesting ceremony was flourishing in full vigour, and every one had heard of it.

It's a custom at Highgate, that all who go through
Must be sworn on the horns, sir; and so, sir, must you.
Bring the horns, shut the door; now, sir, take off your hat;

When you come here again, don't forget to mind *that*.

This last line refers to the peculiar password of those initiated at Highgate. If a man emphasised the word '*that*' in conversation, one knew he had been sworn at Highgate. The custom is now quite a thing of the past, even in Highgate itself, and is scarcely known.

Highgate, being near London, in the palmy days of coaching was naturally a great place for taverns. In 1826, when it was not a very large place, there were no fewer than nineteen, the Gatehouse and the Red Lion being the most important. The Gatehouse inn used to extend right across the road to the burial-ground of the old chapel; hence the name. This arch was taken down in 1769, owing to its lowness. These inns derived much support from soldiers in time of war, as Highgate was generally a halting-place.

Imagine, then, a coach—there were sixty passed

a day—to be just stopping at one of the Highgate inns. When the passengers were all crowded into the room for refreshment, the subject of swearing-in was introduced. It was soon discovered as to who had taken the oath before, and who were willing to take it. When some one declared his willingness to be sworn, in came the landlord in a black gown, mask, and wig, accompanied by the clerk, holding the horns, which were fixed on a pole five feet long. Then the oath was administered to the person proposed. The oath was as follows, as nearly as possible: 'Upstanding and uncovered! Silence! Take notice what I now say unto you, for *that* is the first word of your oath, mind *that*! You must acknowledge me to be your adopted father; I must acknowledge you to be my adopted son. If you do not call me father, you forfeit a bottle of wine; and if I do not call you son, I forfeit the same. And now, my good son, if you are travelling through this village of Highgate, and you have no money in your pocket, go call for a bottle of wine at any house you think proper to go into, and book it to your father's score. If you have any friends with you, you may treat them as well; but if you have money of your own, you must pay for it for yourself. For you must not say you have no money, when you have; neither must you convey the money out of your own pocket into your friends' pockets, for I shall search you as well as them; and if it is found that you, or they, have money, you forfeit a bottle of wine for trying to cozen and cheat your poor old ancient father. You must not eat brown bread while you can get white, unless you like the brown better; you must not drink small-beer while you can get strong, except you like the small the best; or you must not kiss the maid while you can kiss the mistress, except you like the maid best; but sooner than lose a good chance, you may kiss them both.—And now, my good son, for a word or two of advice. Keep from all houses of ill repute, and every place of public resort for bad company; beware of false friends, for they will turn to be your foes, and inveigle you into houses where you may lose your money and get no redress; keep from thieves of every denomination.—And now, my good son, I wish you a safe journey through Highgate and this life. I charge you, my good son, that if you know any in this company who have not taken this oath, you must cause them to take it, or make each of them forfeit a bottle of wine; for if you fail to do so, you will forfeit a bottle of wine yourself.—So now, my son, God bless you! Kiss the horns, or a pretty girl, if you see one here, which you like best, and so be free of Highgate.' Hereupon, a woman, if present, was kissed; if not, the horns—an option not allowed formerly. In later times, after this salutation, the following was added: 'Silence! I have now to acquaint you with your privilege as a freeman of this place. If at any time you are going through Highgate, and want to rest yourself, and you see a pig lying in a ditch, you have liberty to kick her out and take her place; but if you see three lying together, you must only kick out the middle one and lie between them.'

The essential point for the neophyte to remem-

ber was *that*. If he forgot it, he was liable to be resworn. By this password, too, he could be known among his fellow-freedmen.

The origin of the practice is doubtful. Some say it was started by a landlord to increase his trade. The following, however, is the most likely explanation. Highgate, being the nearest spot to London where cattle stopped on their way between Smithfield and the North, many graziers put up at the Gatehouse. These being joined in fraternity, disliked admitting others to join them. Finding they could not exclude strangers, they brought round an ox, and made them kiss its horns, as a mark of fellowship, or quit them.

The horns were of different kinds. The Gatehouse, the Mitre, the Green Dragon, the Bell, the Wrestler, the Bull, the Lord Nelson, the Duke of Wellington, the Crown, the Duke's Head, the Rose and Crown, and the Angel had stags' horns. The Red Lion and Sun had bullocks' horns. The Coach and Horses, the Castle, the Red Lion, the Coopers' Arms, the Flask, and the Fox and Crown had rams' horns. In many of the inns the old horns remain, notably at the Gatehouse, where are an immense pair in the hall. Unfortunately, however, none of the registers of the names of those sworn have been preserved. These would probably reveal many names of celebrated men, who deigned to take a part in this jocularly. Lord Byron was one who was sworn here, and refers to the custom in *Child Harold* (Canto i. stanza 70):

Some o'er thy Thamis row the ribboned fair,
Others along the safer turnpike fly;
Some Richmond Hill ascend, some scud to Ware,
And many to the steep of Highgate hie,
Ask ye, Boetian shades! the reason why?
'Tis to the worship of the solemn horn,
Grasped in the holy hand of mystery,
In whose dread name both men and maids are sworn,
And consecrate the oath with draught, and dance till morn.

THE MONTH: SCIENCE AND ARTS.

THE art of cutting ship canals, which has reached such a wonderful development since the opening of that at Suez, is likely to receive an unfortunate check now that the scheme of piercing the Isthmus of Panama has proved so disastrous a financial failure. We feel much sympathy both with the promoter of this great enterprise and with those poor investors who have in many cases contributed to it all their savings. This scheme would most surely have been carried to a successful issue had not unforeseen obstacles presented themselves, the principal of which was the necessity of diverting the rapid waters of the river Chagres. A canal connecting the Atlantic and Pacific oceans will probably be made some day; but another route must be chosen, most probably the longer one by way of Lake Nicaragua, which, by the way, was the route advocated by the late Emperor Napoleon.

In the meantime, there comes a proposal to make another important Ship Canal which is to connect the Baltic and the White Seas. This

scheme dates from the time of Peter the Great; but it has remained dormant until the success of similar enterprises has once more aroused attention to this very hopeful project. There seems to be no great engineering difficulty to cope with, and it is quite certain that such a canal would have a strategical as well as an economical value; for such a water-way would open up a very large and fertile territory which suffers from the want of means of transport. The cost of this canal is estimated at ten million roubles; and the surveyors who have visited the district and sent in their Report assert that the difficulties of construction are practically nil. It is probable that the work of constructing this new canal will soon be entered upon.

Although the Glasgow Exhibition of 1888 has now become a thing of the past, we trust that many of the new machines and appliances shown there will not be suffered to sink into oblivion. Among these we call to mind the Collapsible Boat, designed by Mr Charles Henderson of 9 York Street, Glasgow. This boat is constructed of steel and wood combined, the framework having an outer flexible covering, made of a specially prepared canvas, which is both water-proof and rot-proof. This boat, although measuring nearly twenty-nine feet in length, weighs only eleven hundred-weight, and will contain with safety at sea sixty to seventy persons, together with water, provisions, &c., for their maintenance. In a collapsed state the boat only measures eleven inches in depth; and five such boats can be placed on board a vessel, one on the top of the other, and will only then occupy the space on board of an ordinary lifeboat. By means of this invention, therefore, it becomes possible for a large passenger steamer or emigrant ship to carry a sufficient number of boats, to save every life on board in case of emergency. We may mention that experiment shows that the boat can be rendered perfectly rigid and ready to place in the water in one minute; and innumerable trials have shown that the number of persons it will accommodate is not overestimated. In these days of frequent collisions at sea, it is the positive duty of ship-owners to provide a ready means of escape for those whose lives are entrusted to them, and it seems that this new collapsible boat offers a very efficient means of doing so.

Those who have much penwork to do have often very unpleasant experience of a complaint which is known as writers' cramp. This affection manifests itself as a cramp of the fingers, accompanied by great pain in the wrist, and many means have been suggested for mitigating it. We have lately received from Mr McGill of Fraserburgh an instrument which he calls the Brachionograph, which he has invented for the relief of sufferers from writers' cramp. It consists of a gauntlet of soft leather, which is laced on the arm from below the wrist to about three-quarters of the length of the forearm. At its lower part this gauntlet is provided with a short rod, which will carry a steel nib like an ordinary penholder. There also projects from the gauntlet, at a certain angle, a metal rod, terminating in a knob or ball. Both these attachments can be regulated by set screws. The gauntlet having been placed on the writer's arm, where it is almost concealed by the sleeve being pulled over it, he writes with the nib,

while his fingers rest idle on the paper before him. By this means the right hand enjoys complete rest, for all movement is brought about from the elbow. From this it will be seen that the instrument is also applicable to those who have lost or injured the right hand. We have tried this apparatus, and feel certain that it fulfils the object for which it is designed.

It is not often that pontoon bridges are used except for military purposes, but those of our readers who have visited the Rhine scenery may remember that there is such a bridge for general use between Coblenz and Ehrenbreitstein. One of the same kind has recently been opened on the Missouri River, at Nebraska City, and it accomplishes a scheme which has long been under discussion, but which had not been carried out previously owing to the rapid current of this river and the opposition offered by the steamboat Companies using the water-way. But both these difficulties having been overcome, the bridge is now in use; and a very curious structure it is. Its total width is twenty-four feet, and it has a roadway for vehicles in the centre, and a pathway on each side for foot-passengers. It is V-shape in form, the point of the V being directed down stream. By very clever mechanism, the bridge opens at this point, when a vessel needs to pass along the river, the action of the tide separating the two halves of the bridge, which then leave an unobstructed channel of five hundred and twenty-eight feet. The current, too, is made the means of closing the bridge, when the vessel has passed; the whole mechanism being put in action by one pair of hands. It is possible that similar bridges will, on account of their cheapness, be constructed on other streams.

The very successful series of Exhibitions which have taken place in London during the last few years are to be continued this year by the establishment of a Spanish Exhibition upon the site of the late American and Italian Exhibitions. And from the extensive preparations which are being made for this important show, it is almost sure to be successful. It is intended to gather here representative collections of articles from the chief centres of industry; and as Spain is not so much visited as other continental countries, English people no doubt will take this opportunity of learning more about it. As in the case of previous Exhibitions, national life will be illustrated by the erection of streets, occupied by citizens in their picturesque costumes, and engaged in their various employments.

Two novel vessels have recently been constructed in America, the first of which can be described as a steamboat, although it is very different from those of the ordinary pattern. It contains a boiler and engine at the stern of the boat, but the method by which this boiler is heated is entirely novel. The fuel is kerosene, which is vaporised by means of heat in a coiled tube, and is then driven out into the furnace and mixed with air. This mixed vapour will burn, it is said, without any smoke or smell, and without any fouling of the boiler tubes. Steam can be got up to working-pressure in three or four minutes, a circumstance which alone is very favourable to this type of vessel.

The other vessel to which we call attention has lately been described in the *New York Herald*.

This is still more of a novelty, in that the working parts are without motion, and therefore there is at once a guarantee that no power is lost by friction. Vaporised petroleum is here the active power in propelling the vessel, but instead of feeding the engine, the vapour is forced from a tank into cylinders, and is ignited by an electric spark. These cylinders are open to the water; and the continual and successive explosions of the vapour act upon that water, rocket-fashion, so that the boat is propelled by the various blows upon the resisting water caused by these constant explosions. The inventor, Mr John H. Secor, claims the following advantages for this boat. The supply of fuel is automatic, and this fuel is consumed directly it is introduced to the cylinders. There is instantaneous conversion of heat into power; and as the functions of the usual modern engine are performed by the combustion chambers, the room occupied by the ordinary machinery is almost altogether saved. We are not informed whether this new boat has been submitted to practical test.

We some time ago announced that M. Pasteur had proposed a novel method of grappling with the rabbit-pest in Australia and New Zealand. This method consisted in infecting the food of the rabbits with microbes of chicken cholera; and the experiments in this country had shown the method to be successful. But the experimental tests which have lately been carried out in New South Wales have to a certain extent failed. Rabbits which actually ate of the food prepared for them did die of the disease; but it is said that they did not carry it to other rabbits. In other words, there were no signs of contagion. It is noteworthy in referring to this subject that the colonists of these rabbit-ridden districts are compensated to a certain extent by the immense export of rabbit-skins which has taken place since the rabbit-plague became the question of the day. From New Zealand alone, during the past ten years, there have been sent out seventy million skins, valued at three-quarters of a million sterling; and during the same period, nearly half that quantity has been exported from Victoria. A large quantity of these skins reach the English market, where cony wool, as it is called, is valued at seven shillings per pound. Many of the cheaper kinds of furs which are used for the linings of coats and cloaks, although supposed to belong to more valued animals, really come from the despised bunny of the antipodes.

Dr Crookes, whose Radiometer astonished the scientific world a few years ago—an instrument, we may remind our readers, which shows the direct change of light into motion, and the phosphorescence of electrified molecules in high vacua—has presented to the Department of Science and Art his collection of instruments, including the first radiometer ever constructed. Some of these instruments are not only of great scientific value, but of intrinsic value also, for they contain collections of rubies, diamonds, and other precious stones for exhibiting the phenomena of phosphorescence. These instruments will be of great value also from an educational point of view, and will be kept for permanent exhibition in the Science Galleries of the South Kensington Museum.

'Who shall decide when doctors disagree?' says

the poet Pope. And surely we may quote this line in referring to that remarkable substance called saccharine, among the latest of the many by-products of the gas manufacture. Some doctors tell us that it is a valuable remedy in certain diseases, that it might usefully take the place of sugar, because it does not interfere with the digestive processes, and that it is in every way innocuous. But their French confrères are of quite the opposite opinion, and warn people against the use of saccharine, as if it were actually a poison.

The propulsion of street tramway cars by means of electricity, although it has been tried in this country, has not, in general, so far succeeded. In New York it appears to be different, for the Julien Electric Promotion Company of that city are now running three cars, apparently with very satisfactory results. These vehicles are driven by means of accumulators or storage batteries, and whereas it used to be necessary to charge these batteries after each trip of twelve miles, they will now run for double that distance without recharging; and the Company hope shortly to make arrangements by which the motors will run thirty-six miles with a single charge from the stationary dynamo-machine.

The medical editor of a certain London paper, who advocates a vegetarian diet, certainly seems to have the courage of his opinions, for he has undertaken to live for an entire month on nothing but whole meal and distilled water. This meal he grinds himself, mixes it with cold distilled water into a batter, and bakes it for an hour and a half. He allows himself one pound of meal and two pints of water daily. The result of this interesting experiment will be looked forward to both by vegetarians and flesh-eaters, and cannot fail in any case to throw light upon many physiological points which are open to question.

The great telescope at the Lick Observatory, California, seems to answer all the expectations of those who were concerned in its establishment. It has already been used for photographic purposes; and we have just had an opportunity of seeing a very marvellous photograph of the moon five inches in diameter, which has been taken by its aid. But big telescopes seem to be somewhat like big guns in the desire which they generate for something bigger still, and it is said that the university of Southern California intends to rival the telescope at the Lick Observatory altogether by constructing one on a far larger scale. Whereas the object-glass of the latter instrument measures three feet across, the contemplated instrument is to have one of forty inches. But it is one thing to contemplate the construction of such an object-glass, and a different thing to complete that construction, not that there is so much difficulty in the work as in producing a plate of glass free from stria and other defects. However, it is said that the well-known firm of A. Clark & Co. has been requested to undertake the work.

Although we have no white ants in this country to eat away our woodwork and to leave but a thin shell behind them, we have a destroyer of wood which is in many cases almost as bad. We refer to dry-rot, which often will render a sound piece of timber as soft as pith. The question has lately been discussed whether this dry-rot is contagious; and it has been asserted that the germ of this

disease in wood may be communicated to sound timber by tools which have previously been used where dry-rot exists. The suggestion is plausible, and it would not seem unnatural that contagion should be possible under such circumstances, and therefore it is a matter that should be submitted to experts.

The invention of the microscope has usually been credited to a Dutchman, who lived towards the end of the sixteenth century. Some doubt has recently been thrown upon the correctness of this statement in a paper presented to the Academy of Sciences, Paris, by M. Govi. He does not claim for one of his own countrymen the honour of having invented this marvellous instrument, but traces its discovery to Galileo, who, although not the inventor of the telescope, is certainly the first man who used it for astronomical research. M. Govi supports his views by certain letters from Galileo which speak unmistakably of magnified images of minute objects, such as parts of insects, &c. We are inclined to think that the discovery of the microscope can hardly be credited to any one man. We know that the use of a lens was known many centuries before the time of Galileo, and by the natural process of evolution the microscope was bound to follow it. But the instrument did not reach its development until late in the present century, and we must certainly look among men of our own times for those to whom the most credit is due.

A train on the Midland Railway has during the past two winters been fitted with a heating apparatus known as the Foulis Patent Railway Carriage-heater. The apparatus consists of a small boiler, which is placed above the ordinary roof-lamp of the carriage, communicating with which are two pipes which serve to circulate the water, and which in turn are connected with a heater below the seat of the carriage. The plan is effectual, and has the merit of being quite free from danger. At the same time it will be observed that the heat used costs nothing.

The whole of Great Britain and Northern France were during the month of December almost constantly enveloped in fog, and this fog was of course felt in its greatest intensity at London, where smoke abatement is a thing at present only talked about. An unusual feature of this fog was the saturated state of the atmosphere, and the leafless branches of the trees testified to the fact by their constant dripping. It is pointed out by the *Times* that this species of wet fog is not nearly so dangerous to life as the dry variety, by which, a few years back, many of the beasts at the London Cattle Show were suffocated. Nothing of the kind occurred during the late show, although the darkness was sometimes that of night. It is suggested that it would be an interesting subject for study to investigate the two conditions under which fog is presented to us, and the reason why one should be so much more harmful than the other.

We are glad to observe that the Zoological Society have secured three living specimens of Pallas's sand-grouse, the interesting stranger from Asia which lately in large flocks paid a visit to the British Isles. On the appearance of any rare feathered creature, it is the custom to beset every endeavour to shoot it; and we are glad, therefore,

of evidence that at least three of these birds escaped. In the island of Möen (Denmark) lately, a *rara avis* had not so lucky an escape, for it was shot at sight. This bird was a specimen of the Isabelline Courser (*Cursorius Isabellinus*), a native of the Desert of Sahara, which has only twice before been seen in Europe.

THE FORTH BRIDGE AND THE. NOVEMBER GALES.

THE severity of the gales in November last, as measured by the recording instruments at the Forth Bridge, affords ample evidence of the intensity of one of the most prolonged storms that have been felt in Scotland for many years. The worst of these gales was that which began early on the morning of the 16th and continued with but little intermission into the morning of the 17th. The wind blew from the south-west; and those in charge of the Forth Bridge believed that, though blowing very hard on Friday, the gale was if anything more severe in the early hours of the following morning.

The Forth Bridge wind-gauges, situated on the old castle of Inchgarvie—a familiar object to all visitors to Queensferry—are three in number. The large gauge presents an area of three hundred square feet to the wind, and is fixed parallel to the centre line of the Forth Bridge, being specially designed and erected to test the pressure of wind over a larger area than that of the gauges commonly in use. This gauge registered at 9 A.M. on the 17th November, for the previous twenty-four hours, a maximum pressure of twenty-seven pounds per square foot. The small revolving gauge, which has an area of only one and a half square feet, and by means of a vane is always at right angles to the direction of the wind, indicated a pressure on the same day of thirty-five pounds per square foot; whilst the gauge of similar dimensions, but rigidly fixed with its face parallel to the centre line of the bridge, registered on the same date forty-one pounds per square foot, a pressure corresponding to a velocity of wind exceeding ninety miles per hour.

It will be noted that the pressure per square foot on the large gauge is considerably less than on the smaller gauges; this reading corresponds with all previous experience at the Forth Bridge, and would seem to indicate that the pressure on the small gauges must be due to 'threads of air' of limited area and high velocity, which, when integrated over a large surface, produce an average pressure of considerably reduced intensity. The inference deduced—namely, that the greater the surface the less the resultant average pressure per square foot, is favourable to the stability of large structures with reference to wind-pressure.

The severity of the gale was evidenced by the numerous casualties in different parts of the country; the Forth itself was the scene of several shipping disasters; and Leith harbour, crowded with vessels which had put in to repair, abundantly testified to the duration and intensity of the gale. Under these circumstances, it is satisfactory to add that neither the permanent erection nor any of the temporary steel structures of the Forth Bridge, in any way suffered from the gale;

some slight damage to timber-stagings, some minor injury to wooden huts, and the shifting of loose planking, being the only loss sustained. The Forth Bridge has behaved precisely as its designers knew it would do, and public confidence in the stability of the giant cantilevers has received material support from this severe and impromptu testing.

SUNWARDS.

DAZZLING track of woven beams,
Stretching to the farthest verge,
Where blue sky in blue sea seems
Scarce perceptibly to merge,
Art thou not a lustrous band
Linking Earth to Wonderland?

Oh, if mortal man might pass
Like a god across the brine,
Where between two planes of glass
Lies the fiery liquid line,
Marvels on yon path of gold
Would his dazzled eyes behold.

He might gaze on either side
Down into the deepest deep,
Where untouched of storm or tide,
Monsters heave in dreamless sleep;
Glimpses catch beneath the foam
Of the mermaid's coral home.

He might tread the watery ways,
Meeting none but phantom ships,
Pass into the golden haze,
Where the sun reluctant dips;
Would he find yon pathway curled
Down towards the under-world?

Nay, perchance beyond our view
Leaps the bright path into space,
Leads through leagues of filmy blue
To a far, delicious place,
In the sparkle of some star
Where all fair enchantments are.

Thither should the traveller win
O'er the clear crystalline track,
Once those fairy realms within
Would he evermore wend back?
Never! Who, from yonder pale
Would return to tell the tale?

A SNOW-SCENE.

WHEN I drew up the blind this morning, my eyes were dazzled by the radiant purity of a heavy fall of snow. For days, a 'black frost' had bound the earth, and the cold was too intense to allow the heavy clouds to discharge their fleecy burden; but cunning Nature took advantage of a weak link in the iron frost-chain, and in the darkness of the wintry night she has spread this carpet, spun of captive rain. And now again there is a keen frost; and the wind, which is in the north, makes itself felt, not by the foreboding gusts that heralded the snow, but by that stealthy keenness which is the characteristic sign of a real winter day.

It is the very best of afternoons for a brisk walk; there is a stimulus even in the crunch of the feet upon the snowy road that takes me past the ancient church and graveyard of Abbots-hall, wherein lies the dust of Sir Walter Scott's quaint and delightful girl-friend 'Pet Marjorie.' Who that has read it can ever forget that exquisite picture, portrayed by the sympathetic pen of Dr John Brown, of burly Sir Walter hastening through the wintry streets of Edinburgh, through slush and fast-falling snow, in search of his little friend, to cheer him when his novel refused to unfold its plot, or he was 'aff the fang'? See how he strides onward, a veritable man of the hills, until, reaching the door of the home which holds his treasure, he takes his key, and letting himself and his faithful hound into the tiny lobby, proceeds to follow the dog's example of shaking himself free from the powdery snow. Then 'Marjorie, Marjorie! where are ye, my bonnie wee croodlin' doo?' he cries; and in swift response to the breezy call, the little maid of seven springs into his arms with impetuous caresses. Nor does he rest content until he has wrapped the beaming little lass warmly within his 'plaid neuk,' and, in spite of Mrs Keith's protest against carrying Marjorie through such an 'on-ding o' snaw,' he has taken her in his strong arms through

the dark street until they have reached the cosy shelter of Sir Walter's own room. Then what a carnival of frolic and laughter was there! The old Edinburgh house rang with their laughter.—Enough! Why should I spoil the racy tale, which has thus suddenly flashed upon me from the palimpsest of memory while I passed the old churchyard where Marjorie sleeps?

This is a day stamped with Winter's kingly signet, and I gaze upon the familiar road winding among the austere bare trees with half a feeling that I am the pioneer to an undiscovered country, for mine are the only footprints visible upon the radiant snow. I could easily imagine that the ghostly silence of night has taken a visible form in this soft whiteness of muffled day. The sky is luminously blue, and the wintry sunlight falls with dazzling effect upon the distant sheet of water, whose uniformly white expanse is broken by three parallel burnished bars of steel-gray ice. These are the curlers' rinks; but I am too far away from the lake to catch the jovial shouts which I know to be ringing up into the frosty sky from the eager knights of the broom.

Snow acts upon the landscape in a truly dramatic fashion, accentuating and exaggerating every light and shadow; the dark bare trees look doubly dark as their intricate outlines of branch and bough stand out in bold relief against the snowy rocky uplands where garrulous echo dwells. I can see from the far hills the ethereal blue smoke of a woodland fagot-fire, its delicate columns rising straight into the rarefied azure sky. How exquisite is the purity of the snow-shadows, tinged as they are with the divinest blue, tipped with the most fleeting suggestion of rosy colour, amid which the frozen crystals shimmer like scattered diamonds! Every leafless tree, every bending twig of the stiffened hawthorn hedges, is decked with twinkling jewels, for lance-like icicles gleam and scintillate in thousands, every one holding an iridescent prism of shifting colour within its minute compass.

I pass an avenue of stately snow-encrusted

trees, each intent upon the winter's task of hardening its wood now that the sweeter toil of leafage is past. All is silent and snow-laden here; every chance sound assumes an undue significance in this far-stretching glade, and falls upon the ear clear yet muffled in the crisp silence: a bough from 'an elm is suddenly snapped by the frost, and it creaks dolefully for an instant ere it falls with a dull thud upon the frozen snow: the alert 'Caw, caw!' of a passing crow strikes with startling clangour from above; and as I look involuntarily upward I catch a glimpse of his black form as he wings— I had almost said elbows!—his vigorous way westward.

Red Robin's cheerful ditty breaks the enchanted silence of the woods, for this little winter chorister is as much a matter of course in a snow-scene as is a ghost in an ancient castle. The harsh wintry cry of a flock of fieldfares on their way to some secluded meadow is heard overhead; a few thrushes rustle the dead leaves lying in sheltered hollows of the hedge; while an impulsive flock of chattering sparrows, alighting hurriedly upon the snow-laden hedge, send the fleecy particles to the ground as they pause for a moment to revile a hawk disappearing over the distant woods. Now that the eager little disputants have discovered that I am near, off they hurry in the midst of a cloud of disturbed snow-flakes, and I can hear them from the safe distance of the next field shrilling forth sundry seemingly derogatory phrases; but the chattering dies faintly away, and once more the silence is unbroken except for an occasional metallic 'Ching, ching!' which is the winter song of the bright little chaffinch.

As I walk onward, I begin to trace in the snow many an otherwise secret footprint. Here, for instance, are the bold hieroglyphics of the starling and the blackbird; here the careless zigzag of the hurrying chaffinch, and the filigree snow-embroidery wrought "by the tiny mouse and the timid hare. This sharply chiselled track is the witness of a marauding squirrel's nocturnal raid: let us hope that his store of nuts will outlast the winter, for he is an independent and hardy little fellow, the Rob Roy of the animal kingdom, who adopts

The simple plan,
That they should take who have the power,
And they should keep who can.

The gamekeeper's masterful hobnails are also printed here, and so are the honest footpads of his faithful collie. An adventurous couple—of lovers, shall we say?—have left their trace, but the charming fair one has unwittingly patented upon the snow the hideous fact that she wears high-heeled boots; her footprints are all 'out of drawing,' and they present a humiliating contrast to the truthful impressions of Nature's silvan folk.

But now I must retrace my way, for the snow

has drifted into deep wreaths in this more unfrequented part of the woodland path, and it is much too deep and powdery for pleasant walking; besides, the short winter day is drawing to a close, and the sun is growing redder as he sinks behind the trees.

'Tis the low sun makes the colour,

and the western sky is gorgeous in its graduated tinting of orange, yellow, and rosy pink—and my shadow slanting across the snow has a faint yellow aureole round its head, which is the only crown—and who could desire a better?—that I am likely to wear in this world.

Nature is asleep to-day. I feel it with a sudden awe and chill, as if I stood in the presence of the dead. The time of snow is her resting-time; let us not disturb her sleep. Why should she be aroused to whom time is nothing—whose time is counted by ages—whose ages merge into eternity? Deep-eyed Nature never hastes—it is only man with his pathetic three-score years and ten who is constantly in a hurry. When shall we learn of Nature this secret of immortal youth? When shall we find in her solitudes her blessed gift of healing? For Nature's solitude never curses the heart with that dreary sense of loneliness that abides in the busy haunts of the crowded city, where men scarcely remember that there is a sky brooding silently overhead.

As I pursue the sloping homeward way, the sun sinks red and broad behind the dark masses of the trees, and the rosy flood of colour quite obliterates their delicately-bare pencilled outlines. How black the fluttering starlings look, and how restlessly they clamour as they seek their hereditary home in the ancient elms!

JOHN VALE'S GUARDIAN.

By DAVID CHRISTIE MURRAY,
Author of 'VAL STRANGE,' 'JOSEPH'S COAT,'
'RAINBOW GOLD,' etc.

CHAPTER VI.

THE difference between your big Napoleon who curses a continent, and your little Napoleon who makes life intolerable for somebody in a mere corner of the world, is not at all a difference in will or spirit, but only in brains. At bottom in either case there is a sublime conviction that the earth and the fulness thereof are for him, and not for other people; that the good things of this life in the possession of another are misplaced, and that on him they are naturally and fittingly bestowed; that there is somehow vested in him an inherent right to everything, and that the ownership of property or the exercise of will on the part of any other creature under heaven is more or less of an injury to him.

Mr Robert Snelling was mentally a very small creature by the side of the grand Napoleon, but morally he was a very faithful copy. If young

John's hairs had been estates, his cupidity would have had stomach for them all. Mr Snelling looked reasonably at things. For instance: here was this puling boy, who cried if he had a geographical question closely pressed upon him, and whose head was as soft as a boiled turnip—a mere infant, who knew nothing of the value of money or the use of lands—and there on the other side was he, Robert Snelling, keen to enjoy the possession of property, an excellent man of business, in the prime of life and the full possession of his faculties. Now, to whom, in the name of Justice and Common Sense, would it be reasonable to suppose that the property ought to fall? To the puling boy? Ridiculous! To Robert Snelling? Assuredly! A wayfaring man, though a fool, could not go by the question in a hurry without being able to decide it.

By the great rights of Reason and Propriety, John's property ought to have belonged to Robert Snelling. Absurdly enough, it belonged to John, and there was John to claim it. One of those irritating, ridiculous, and unescapable positions the Napoleonic order of mind is compelled to gird at, and if there be no means of curing it, to endure. After all, were there any means of curing it? Perhaps there were.

Now, if things to the full as abominable and villainous were not done every day, it would be pleasant and satisfactory to hope that they were never done at all; but the plain English is that Mr Snelling had determined to hold John's property by the simple expedient of keeping John in such a mental condition that he should never be fit to hold it. Of course he never said that plainly to himself, because it is one of the unailing characteristics of a mean villain never to confess himself to his own soul. He disguised his intent under the formula that he meant to do his duty by his charge. He was going to do that duty fearlessly and justly. He did not mean to let any foolish consideration for the boy's fads and fancies come in between him and the wishes of the boy's dying father. John was going to be educated—pitilessly. And monstrous as it seems, and monstrous as it is, in the contemplation of the slow crushing and destruction of the boy's mind with the clear understanding that Robert Snelling would profit by it in the end, he did actually throw a veil of virtue over his intended scoundrelism, and persuaded himself, clearly enough for all practical purposes, that in that way and in that way only he would be doing his duty.

If he had dared to let his own ugly purpose stand there naked, and had had the hardihood to look at it and acknowledge it every day, it would have been there no whit more clearly. The disguise he put upon it no more hid it from his intelligence than a bandage on a wound will hide pain from the nerves. The crookback Richard owned openly, 'I am determined to be a villain,' but then the crookback had a sense of humour, and made that fall avowal in a biting, wicked jocularity which left it earnest. Mr Robert Snelling had no sense of humour, and so was compelled to cloak himself from himself, and to look respectable to his own interior eye.

John Vale the elder had been widely known and respected, and a large following of old friends saw him to the grave; but John the younger was his only real mourner. John the younger, in a puzzled nightmare, followed the body to the churchyard, seated in a sombre coach with Uncle Robert and two neighbouring farmers, and watched the ceaseless rain and the wildly waving boughs of trees and hedges, which tossed in the wind with the expression of just such a despair as slumbered somewhere in the recesses of his clouded mind. No more, no more; grief unpeakable—grief, grief, grief beyond hope or solace. The howling wind and plunging rain and tortured leafless branches spoke for the dumbness of his heart; but he could find no voice to answer them.

He saw the body committed to the earth, and did not cry or make a sign of grief. He went back to the chill house which had been home, and sat at table with the funeral party, who ate heartily, and without being more barbarous than other funeral parties, talked prettily loudly after dinner, and smoked long pipes round the table over the heavy decanters of port and sherry, and the steaming glasses of hot brandy-and-water. They had respected the dead man in his time, and they were there to show it. The elder John Vale himself had made one of such a party in his day, and had assisted in the decorous jollification which followed on the funeral.

Snelling sat at the head of the table, and the local solicitor, who had drawn up Vale's will, sat at the foot, and before the pipes were lit, the farmer's simple last testament was read.

'It's a heavyish charge to be left upon a man,' said Snelling, with his slow deliberate drawl; 'and for what is to be done for the lad, a thousand pound is no great payment. If I was to look at it in that way, I should feel a right to be disappointed. But I knowed John's intentions; and if his turn came first, I was willing to bear the burden. It's only putting the two fortunes into one basket, for I make no secret of it that young John'll have everything that I can leave him. I'm a lordly man, and he'll naturally come in for everything.'

'That's how to look at it, Mr Snelling,' said Farmer Day from half-way down the table.

'That's how I look at it,' answered Snelling. 'I shall do my duty by the lad. He's got to be educated, and I shall see as his education isn't neglected. Education's come to mean more than it did in our young days, gentlemen, and no man can afford to neglect it.'

One man near at hand was of opinion that this here education was too much run after, but Snelling came down upon him ponderously. 'You're behind the time, Mr Tonks; you're behind the time, sir.—And whatever I might think about the question, gentlemen, I haven't got to consult my own desires alone. It makes little difference to me that my desires happen to go in the same way with poor John's, for whatever his might have been, I should have thought it a sacred duty to see his wishes carried out. "I look to you," he said to me the day he died—"I look to you, Robert, to carry out my wishes, and to do your duty by the child." His wish was that young John should receive a first-rate education; and a first-rate education I shall make a

point of giving him.' He was paving the way towards his own justification, and his appeal to the dead man's last words gave him no qualm of conscience.

'Young John,' said Farmer Day, 'don't look to me as if he'd do credit to a lot of educating. Sence he got that crack on the side of the head, he's been a bit stupid and mythered, like.'

'I'm afraid that's so,' Snelling answered. 'But the best must be made of such material as there is to work upon. If four mile an hour will do twenty mile in five hours, three mile an hour will do one-and-twenty mile in seven.'

Two or three of the funeral guests were impressed by this, and said that that was how to look at it.

'Depend upon it, gentlemen,' said Snelling, 'that is how to look at it. Make the best of your material. What speed can't do, application may. You've heard the story of the hare and the tortoise? I shall have to make that my motto with my nephew, I'm afraid. But I shall see his father's wishes carried out; and as far as in me lies, and as far as in him lies, I shall try to make a scholar of him.'

This declaration met with general approval; and the one man who did not approve of education was in so marked a minority that he felt impelled to say that Snelling was most likely in the right. He had never bothered himself much about these things. Educating hadn't come up much in his young days, and he didn't know as he was much the worse for it. He was as warm as here and there one, and had contrived to carry his cup upright. His lad Jabez could read handwriting like print; and since there was more handwriting going about than there used to be, that was no doubt a convenience.

Before this conversation had begun, John had stolen away to the little room in which he had been used to sleep, and curling himself up on the bed, had found relief from the heavy stupefaction of his sorrow in tears. He cried until he fell asleep; and lay there forgotten and alone until the guests began to call for their traps, and to struggle into their overcoats, and to unpin from their hats the heavy black silk streamers with which they had been decorated for the funeral. Like careful saving people as they were, they carried these home for their wives, who saved them up for dresses. The black silk of a farmer's wife would sometimes represent in its voluminous folds a score of dead acquaintances, more or less.

Whilst the good-byes were going on, Snelling called for Isaiah, who came in from the kitchen, where he had been regaling with other servitors. 'Find Master Vale,' said Snelling, 'and tell him to get ready. Then harness the trap, and find the lad something to put over his shoulders will keep him dry. We shall have a wettish drive.'

This carefulness for young John's welfare was born of the presence of the guests; and when it seemed to be accepted as a matter of course, and excited no comment, the tender creature added: 'The poor little chap'll want taking care of. He's little likely to be able to take care of himself, I fancy.'

'It's lucky for him as he's fell into the hands of one of his relations,' said one bluff

kindly-faced farmer, 'and not into them of a stranger.'

'Ah!' Snelling replied magnanimously, 'it's a sore loss for the lad, and I mustn't grumble at the bit of trouble.'

The early winter evening was falling fast, and candles were lit already. Isaiah, peering hither and thither about the darkening house, and failing to find young John, took a light at length and mounted to the upper story. He walked into two or three deserted rooms, all of which seemed to have the new chill of loneliness and loss upon them, and at last entered the chamber in which the boy lay asleep. The sense of solitude and awe, impelled him to go on tiptoe; and when he had pushed the door gently open and had caught sight of the figure on the bed, he moved yet more softly, and shaded with his hand the light he carried. John's eyelids were red with tears, and reddened channels were clearly to be seen on his pale cheeks. His lashes were still moist, and a shivering sob now and again broke the level cadence of his breathing. He was fast asleep; and Isaiah, still shading the candle, bent close over him and peered into his face. The man's inexpressive visage showed little, but he shook his head at intervals, and sighed once or twice, as if in pity.

His master's voice awoke him from a day-dream, and he answered, 'Coming.' The call awoke John, who sat up on the bed with a forlorn and wondering air.

'Come along, Master John,' said Isaiah. 'We're a-going home.' John began to cry again, and Isaiah looked at him in a wretched perplexity, scratching his head rather viciously the while. 'Crying won't mend it, you know,' he said at length. 'It was to be, and it was. All the crying in the world won't fetch him back again.'

There was no denying the philosophy; but it was cold comfort, and young John's tears seemed to fall the faster for it.

'Isaiah!' cried Snelling from below in a tone of angry impatience.

'Come along, Master John,' said Isaiah. 'There's the gaffer a-calling, and we must go home.'

'It isn't home, Isaiah,' John answered with a burst of tears; 'this is home.'

Snelling shouted again from below stairs, and came after his call with a heavy footstep, solid, slow, and purposeful, like his voice and manner. The light gleaming through the open door guided him to the chamber.

'Am I to wait here all night, Isaiah?' he demanded.

'What do you want?' asked Isaiah snappishly, glad of a chance to relieve his sensations by a brush with his employer. 'Do you want me to take the orphan by the scruff o' the neck and chuck him down-stairs? Or would you rather as I should wait for him a bit till he gets ready?'

Snelling contented himself with a wrathful glance, which had as much effect upon Isaiah as it would have had upon the wall.

'Come, come, my lad,' he said, addressing John, 'we must be going. There's no use in idle tears, though you was to shed enough to fill a pond.'

Isaiah had offered the same wretched consola-

tion; but there are ways and ways of saying things, and the man's voice had sounded kindly, while the master's sounded pitiless and hard. For one reason or another, the harsh voice had the greater effect; and John, stifling his sobs, took the hand which Uncle Robert extended to him, and suffered himself to be led from the room.

'Now get the trap ready, Isaiah, and look sharp about it,' said Snelling when they reached the kitchen. 'Everybody's gone, and there's nothing left but to follow 'em, and lock up.' Isaiah went into the rain with a loose sack thrown over his shoulders, and Snelling, still holding young John's hand, sat down. He was not utterly unfeeling—nobody is—and John's distress made him angry. 'I thought I'd asked you to give over crying,' he said therefore. 'You'd better do as you are bid, or else I may give you something to snivel for.' This speech showed so clearly that he had more to cry for than he had hitherto guessed, that John, who had been struggling hard against his grief, broke out afresh.

'Very good, John,' said Uncle Robert—'very good. We shall know how to tame this disobedient spirit by-and-by.' With that he released him, and a wheel of dull pain began to whirl in the boy's head. It acted like a narcotic, stilling all thought and emotion; and before Isaiah came back to say that the trap was ready, John had ceased to cry, and had fallen into mere vacuity and dullness. Snelling thrust a candle towards his face and bent forward to scrutinise him. The face he looked at was troubled with recent tears, but except that it was sad and helpless, bore hardly any expression. It was obvious to the mind of the observer that this was the way to take with him, and he said with a calm and weighty decision, by way of keeping the veil of respectable intention over the ugly figure in his mind: 'One of my duties is to teach you obedience, John, and you may rely upon it as I shan't forget it.'

Isaiah appearing to announce that all was ready, was bidden to prepare John for the journey, and obeyed in silence.

'Safe bind, safe find,' said Uncle Robert, locking the door and pocketing the key. He turned to look at the house, when he was half-way down the path, and stood a moment or two in the pouring rain, thinking already that the desirable freehold tenement and farm-lands surrounding and adjoining were as good as his. At the sight of John seated in the trap, his gorge rose; he meant so vilely by him that he could not do less than hate him, and he began to hate him at that instant. What right had he to be in the world at all, blocking up Robert Snelling's way to prosperity? It was abominable in him even to be there to be disposed of, soiling a man's conscience. Though, when Mr Snelling caught himself at that fancy, even for a second, he wrenched himself wrathfully away from it, and fixed his single eye on duty. He was going to educate that boy and do his duty by him; but he knew beforehand that the boy would so ill repay his cares that he would be good for nothing all his lifetime.

The sick wheel of dull pain ran round in

John's head until it ran down of itself, and he fell asleep again in the rain and darkness, with the tears of the mournful night upon his face.

THE EXCISE DEPARTMENT AND ITS OFFICIALS.

As is probably well known, the department of Inland Revenue is that which is responsible for the collection of the duties granted by parliament on excisable commodities, such as beer, spirits, &c.; as also for the income tax, house duty, land tax, and the various stamp and license duties. It is thus distinguished from the other great revenue department of the Customs, which deals exclusively with the taxation of goods imported from abroad.

The Inland Revenue department, which is controlled by a Board, consisting of a chairman, deputy-chairman, and three commissioners, is divided into two sections: (1) The Excise department, responsible for the collection of the duty on beer and spirits, the various license duties, and the assessed taxes. (2) The department of Stamps and Taxes, responsible for the collection of the stamp duties, the income tax, land tax, and inhabited house duty. There are likewise several subdivisions; but these are generally of a purely departmental character, between which the barriers are being gradually broken down, apparently with the object of forming the entire department into one compact whole.

It is proposed to deal with the first-named of these divisions, the Excise department and its officials, which officials are divided into several grades, the highest being that of secretary, the lowest that of second-class assistant. The character of the department itself is purely democratic, inasmuch as every official in that department, from the secretary downwards, has commenced his career in the capacity of second-class assistant, his subsequent promotion having been the reward of his own merit and ability, not that of extraneous influence or patronage. The designations of the various grades have recently been somewhat altered by the authorities, but are here retained, as being more expressive of the duties performed by the several officials.

The position of an officer of Excise offers many inducements, more especially to a young man. The mere prospect of passing for the first few years of his career a somewhat bohemian existence is not without its charms; the duties, although in many respects harder, are yet more varied and responsible than those of an ordinary commercial clerk. The initial salary and prospects of promotion are tolerably good; and there is in addition that feeling of absolute security of office, which security but few commercial appointments can confer.

Twice a year, competitive examinations are held at various centres, which examinations are duly advertised in the leading newspapers. The subjects comprised are: Handwriting, Dictation, English Composition, Elementary Arithmetic (including Vulgar and Decimal Fractions), Higher Arithmetic (including Mensuration), and Geography (more especially that of the British Isles). The first four of these subjects are obligatory, a

high percentage of marks on each being absolutely necessary; the latter two are by courtesy termed optional; but it may be safely asserted that no candidate has yet been successful by whom either subject has been omitted.

Having been successful in the competitive examination, the young man is in due course instructed to report himself at the office of a certain collector of Inland Revenue. By that gentleman he is transferred, as a pupil, to the guardian care of a division officer, who is required to furnish him with practical instruction in the various branches of his future duties, and who will for the next six weeks act towards him in the capacity of guide, philosopher, and friend. As a thorough practical knowledge of the mode of working adopted in both a brewery and a distillery forms the very alphabet of an Excise officer's official education, the pupil will pass the greater portion of his time in observing and noting the various operations incidental to these two branches of industry. In most cases the matter will be arranged by the division of the probationary period into two sections, one of which will be occupied in rendering himself familiar with the practical working of a brewery, the remaining portion being passed in a distillery.

The first feeling of the pupil will probably be one of extreme veridancy. At the outset, the brewery or distillery will present itself to him as a confused mass of coppers, mash-tuns, pipes, &c., of the nature and use of which he has not even the most remote idea. To the pupil the term of probation will be no term of idle leisure. During that period he is required to make occasional surveys on his own account; to keep a set of books in the same manner as an ordinary officer; to learn the practical working both of a brewery and of a distillery; to become an adept at gauging; and likewise to become versed in the several uses of the thermometer, hydrometer, and saccharometer. His evenings will be occupied in grinding away at the various books of official regulations with which he has been provided, and in comparison with which the driest treatise on political economy may be regarded as light and entertaining reading.

At the expiry of the six weeks' instruction, the pupil is required to pass a somewhat severe technical examination at the hands of the collector. When this examination has been undergone and passed, he is in due course furnished with a parchment document headed with the royal coat of arms, and addressed to 'All persons to whom these presents shall come, greeting, &c.,' which document informs such aforesaid persons, in the roundabout way peculiar to documents of a legal nature, that the Commissioners of Inland Revenue have appointed William Jones to be their surveyor, gauger, and officer. Upon receipt of this commission our friend becomes a full-fledged Second-class Assistant of Excise; and at this stage of the proceedings he will probably be transferred from the 'collection' in which he received his education, to another in which the staff of second-class assistants has fallen below the required number.

For the next three or four years the career of Jones will be of the knock-about description. His duty is that of officiating for 'ride' and 'division' officers when absent from their stations on

account of sickness or vacation. As a general rule, he is not in one place for more than a few weeks at a time; and if he be placed in a collection which covers a large area of country, he will not officiate many times in the same station. It may even be his lot during his term of office as a second-class assistant to be employed in two, three, or even in four different collections. When officiating for an officer, the duties and responsibilities of the assistant are precisely the same as those of an officer, the nature of the duties varying according to the station in which he is placed.

As a second-class assistant, Jones, on the whole, is not badly off; and his salary, if not large, is sufficient to satisfy his moderate wants, even if not much margin be left for saving. In some collections which cover no larger area than the town in which the office is situated, his life may be of a more settled character; but, as a general rule, he will during his assistantcy gain vast experience both in the matter of lodgings and of landladies. His term of office as a second-class assistant will last for three or four, sometimes five years. At the end of that time he will receive a nominal promotion, and will then become a First-class Assistant.

As a first-class assistant the life of Jones will be of a more settled description. He will be stationed either at a brewery, distillery, or bonded warehouse where a tolerably large staff of officers is necessary. With and alongside these officers he will work, the difference in the duties performed by him and by them being more apparent than real. This appointment he will generally hold until such time as he receives his next promotion; but in some cases he will be liable to be removed from one collection to another. This is more especially the case in the small Highland distilleries, which, as a general rule, cease operations during the summer months; and thus the first-class assistants stationed on these distilleries must perforce at the end of the spring seek fresh fields.

To the ambitious among the assistants, the Excise department offers a free education in practical chemistry. A certain number of students are attached to the Inland Revenue laboratory at Somerset House, and, as vacancies arise, they are filled up by those who have been successful in a competitive examination. The students obtain a practical analytical training at the laboratory for two years, free admission to the lectures at South Kensington, and likewise a monetary allowance for the purchase of their books, &c. At the termination of their term of training they are again drafted into the ranks of the outdoor service.

An assistant can also, if he should so wish, receive an indoor appointment. There is a large staff of clerks at London and at the offices of the various collectors of Inland Revenue, whose numbers are recruited from among the members of the outdoor service, principally from among the assistants. By the acceptance of one of these posts, the assistant, it is true, avoids a certain amount of unpleasant and arduous work; but, on the other hand, a great sacrifice has to be made. By remaining in the office, the highest position to which he can aspire is that of chief or superintending clerk—equivalent to that of

supervisor—inasmuch as the appointments of collector and inspector are reserved for those officers who have passed their official career in the performance of the practical work of the department.

At the end of five or six years from the time of his entry to the service, Jones will again obtain promotion, receiving the designation of Ride-officer. A certain district of country, more or less extensive, is allotted to him for the collection of the revenue in which he is responsible. His duties consist in the survey of breweries, the collection of the license duties and the assessed taxes. Many 'rides' are so extensive, that in order to perform his duties it is necessary for the officer to provide himself with a horse and trap, a pecuniary allowance being granted by the Board for the expenses of horse-keep. Even those rides which do not necessitate the use of a vehicle entail a considerable amount of pedestrian exercise; and in all rides, an ardent bicyclist or tricyclist will find ample opportunity for making his favourite hobby of practical utility.

In spite of minor drawbacks, the years which Jones passes as a ride-officer will be the most pleasant and enjoyable of his official career. His salary is moderately good, and as he lives in the country it is of more real value than a larger income in a town; the duties being of an outdoor nature, tend to better health; and being stationed in a village or small town, if he do not occupy a high place in the regard and esteem of its inhabitants the fault in most cases will be with himself. When promotion comes, it is accepted with some regret; and this feeling of regret is so strong, that many officers, disregarding the incentives of ambition, decline to advance to the higher branches of their profession, preferring to pass the remaining years of their career in the performance of their favourite duties, among the scenes and people which have become so dear to them.

The period passed in a ride is from five to six years, at the end of which Jones will become a Division officer. Promotion from a ride to a division does not follow as a mere matter of course—although the general run of officers are so promoted—but is consequent upon the survey books and the general work, &c., of the officer having been found satisfactory upon examination at Somerset House.

As a division officer, Jones will now be stationed in a large town, at either a brewery, distillery, bonded warehouse, or at what is known as a general business station. Not only will there now be the sudden change from a country to a town life, but there will be for a time at least a certain feeling of restraint. As an assistant, but more especially as a ride officer, Jones—so long as his work was properly done—was not bound down to the exact hours in which such work should be done. Now, everything is altered, and for the future he will be to a certain extent the slave of a time-table. His present duties are of a more responsible nature than any which he has hitherto performed, inasmuch as there will be a far greater amount of revenue at stake. If stationed at a brewery, his work consists in supervising and checking the various operations of the brewer, gauging the contents of the various tuns, testing the strength of the worts (beer), and con-

ducting the personal investigations necessary to ensure the security of the revenue from fraud in any shape or form. At a distillery, his duties will be practically the same as at a brewery, although the details of the survey will somewhat vary, on account of the difference in the nature of the operations. At a bonded warehouse he will be responsible for the security of the wines and spirits contained therein, and also for the payment of duty on all goods which are removed for consumption. He has to gauge the various casks, and to test the strength of their contents when received into the warehouse; to supervise and take due note of the operations of blending, racking, and bottling performed in the warehouses by the merchants themselves; to gauge the casks and test the strength of the spirits prior to their despatch from the warehouse; to keep the necessary books, ledgers, &c., and to ensure the general security of the revenue. At a general business station the officer will be responsible for the various license duties in a certain district, which district will generally comprise several breweries, and occasionally a small bonded warehouse.

The next grade to that of division officer—in the upward scale—is that of Supervisor, promotion to which is gained by success in a quasi-competitive technical examination. A division officer, if desirous of further promotion, must present a petition to the Board for permission to enter as a competitor at one of these examinations. At the end of a certain term of service—generally five or six years—his books, &c., are examined at Somerset House; and if they be considered satisfactory, he will be called upon to undergo a literary examination of a severe technical nature, into which the character of competition enters to a certain—though not to an entire—extent. If this examination be successfully undergone, the officer receives the title of Examiner, and at once obtains brevet rank as Supervisor.

This examination forms the parting of the ways in the officer's future career; for the question of success or non-success means either subsequent promotion to the higher branches of the profession, possibly even a staff appointment; or, on the other hand, a permanent stay among the numbers of the rank and file. Now begins that gradual compression, selection, and rejection by means of which the ultimate chiefs of the service are chosen from among the number of their colleagues. The examination for the post of Supervisor forms the threshold to the higher appointments, and if Jones be not successful in this examination, a division officer he must remain until the end of the chapter. It will have been noticed that when passing from the ride to the division we left behind us a few colleagues who were unwilling to accompany us further on our way. Now we leave behind us a far greater number—in fact, about two-thirds of our colleagues—not on this occasion from want of desire for further promotion, but, on the contrary, from the sheer force of adverse circumstances. The comparatively few men who still continue the onward march are being gradually selected; and as they are fewer in number, their conduct and abilities will be now brought under a criticism much more keen and much more severe than any to which they have hitherto been subjected.

Upon appointment as Examiner, the officer has again to enter upon a somewhat bohemian existence, which for the staid domesticated middle-aged man will not have the same charms as it probably had in former days for the unsophisticated and unfettered youth. During the period of his examinership, his headquarters will be at Somerset House, from which place he is sent to various parts of the United Kingdom in order to officiate for Supervisors who may from various causes be absent from their districts. By seniority he will in his turn obtain promotion, and at the expiry of about two years will himself receive a district.

The United Kingdom is divided for revenue purposes into about five hundred districts, each placed in the charge of a supervisor. To one of these districts the newcomer is appointed. His duty will—as his official designation implies—consist in the supervision of the work of the officers whose stations are included in his district, and for the proper performance of whose duties he is held responsible. Periodically, he visits the various officers' stations, checks their survey and other books, and tests the correctness of their general work by himself making, at unfixed and uncertain periods, a personal survey of the breweries, &c., under their charge, in order to verify or otherwise the results at which they have previously arrived. The incidental details involved are of a manifold description; the hours of labour are protracted, and in many cases the work itself is of an extremely arduous and fatiguing nature.

At the end of a certain term of service, the supervisor, if he have previously petitioned the Board for promotion, and his books and work have been found in a satisfactory condition, is permitted to enter for another semi-competitive technical examination, the nature of which is in its general outlines the same as that previously undergone by the division officer, but of a much more difficult character. The reward of success in this examination is the immediate promotion to the rank of Assistant-Inspector, and the subsequent appointment of Collector of Inland Revenue, the most responsible and lucrative in the service, and which is regarded by the average assistant in the same light as a judgeship by a Temple student.

The great majority, however, of those who have attained to the rank of supervisor do not seek for further promotion, a fact which is not under the circumstances surprising. The supervisor, even if he progress no further, is in possession of a salary which will compare favourably with that of other professional men, and also occupies a position which is at the same time one of great responsibility, and likewise one which will be certain to ensure for him a considerable amount of respect.

The assistant-inspector, immediately upon his promotion, has again to enter upon a life of a somewhat knockabout description. Until, by seniority, he receives a fixed appointment, he will officiate in various parts of the kingdom for collectors who may be temporarily absent from their posts. At the end of this probationary period, which is of two or three years' duration, he will in his turn be appointed to a Collectorship, and will be for the future ensconced in that

'arm-chair' which forms the Mecca of the Excise officers' weary pilgrimage.

In the United Kingdom there are about ninety Inland Revenue 'collections' of varying degrees of importance. In each of these districts the chief revenue officer is the collector, who is responsible to the Board of Inland Revenue for the due collection of the various taxes, duties, and licenses placed under his control, as also for the conduct, &c. of his subordinate officers. To one of these districts which is considered as of comparatively small importance, the quondam assistant-inspector will now be appointed, and will receive, according to seniority and merit, future promotion to collectorships of a more important and likewise of a more lucrative character.

Of superior rank to the collector of Inland Revenue there now remain only the ten Inspectors, the Chief Inspector, and the Secretary. In order to obtain promotion from the collector's chair to one of these staff appointments, no further examination has to be undergone, promotion being the reward of combined merit, ability, and seniority. The power of making these appointments is vested absolutely in the hands of the Commissioners of Inland Revenue; the reasons which influence them in making such appointments are never disclosed, but kept, as it were, cabinet secrets.

The chief inspector is the responsible head of the outdoor service; while the secretary is, under the Board, the chief officer of the entire department. Higher promotion than that of secretary has, it is believed, been obtained in only one instance, when the gentleman referred to became Deputy-Chairman of Inland Revenue. The position of Chairman has never yet been occupied by a gentleman who has risen from the ranks of the Excise service. Perhaps the future may see the practical fulfilment of a consummation so much to be wished.

THE LOST DIAMONDS OF THE ORANGE RIVER.

By H. A. BRYDEN.

I.

MANY are the stories told at the outspan fires of the South African transport riders, some weird, some romantic, some of native wars, some of fierce encounters with the wild beasts of the land. Often as I travelled with my friends up-country we stopped to have a chat with these rugged people, and some strange and interesting information was obtained in this way. The transport rider—the carrier of Africa—with his stout wagon and span of oxen travels year after year over the rough roads of Cape Colony, and far beyond, in all directions, and is constantly encountering all sorts and conditions of men, white, black, and off-coloured; and in his wanderings or over his evening camp-fire he picks up great store of legend and adventure from the passing hunters, explorers, and traders.

One night, after a day's journey through the Bushveldt, we lay at a farmhouse near which was a public outspan. At this outspan two transport riders were sitting snugly over their evening meal. They seemed a couple of cheery good fellows, one an English Afriander, the other an Englishman,

an old University man, and well read, as we afterwards discovered, and nothing would suit them but that we should join them and take pot-luck.

Supper finished, some good old Cango (the best home-manufactured brandy of the Cape, made in the Outshoorn district) was produced, pipes lighted, and then we began to 'yarn.' For an hour or more we talked upon a variety of topics—old days in England, the voyage to the Cape, the Colony, its prospects, and its sport.

'Tis strange,' said one of our number, 'how little is known of the Orange River—at all events west of the Falls. I don't think I ever met a man who had been down it. One would think the Colonists would know something of their northern boundary; as a matter of fact they don't.'

'Ah! talking of the Orange River reminds me,' said the younger of the transport riders, the ex-Oxonian and the more loquacious of the two, 'of a most extraordinary yarn I heard from a man I fell in with, some years back, stranded in the "thirst-land" north-west of Shoshong. Poor chap! he was in a sorry plight. He was an English gentleman, who for years had, from sheer love of sport and a wild life, been hunting big game in the interior. That season he had stayed too late on the Chobe River near where it runs into the Zambezi, and with most of his people had got fever badly. They had had a disastrous *trek* out, losing most of their oxen and all their horses; and when I came across them they were stuck fast in the *doorst-land* (thirst-land), unable to move forward or back. For two and a half days they had been without water; and from being in bad health to begin with, hadn't half a chance; and if I had not stumbled upon them, they must all have been dead within fifteen hours. I had luckily some water in my *ratjes*, and managed to pull them round; and that night, leaving their wagon in the desert, in hope of being saved subsequently, and taking as much of the ivory and valuables as we could manage, and Mowbray's (the Englishman's) guns and ammunition, we made a good *trek*, and reached water on the afternoon of the next day. I never saw a man so grateful as Mowbray. During the short time I knew him I found him one of the best fellows and most delightful companions I ever met. I dosed him with quinine, and pulled him together till we got to Shoshong; but before we had got half-way down to Griqualand, Mowbray grew suddenly worse, and died one evening in my wagon just at sunset. We buried him under a *kameel-doorn* tree, covering the grave with heavy stones, and fencing it strongly with thorns, to keep away the jackals and hyenas.

'Many and many a talk I had with poor Mowbray before he died. One evening in particular, as we sat before the camp-fire on the dewless ground, where I had propped him up, and made him comfortable, he told me a most strange story, a story so wonderful that most people would look upon it as wildly improbable. He began in this way:

Felton, you have been a kind friend to me—kind and tender as any woman, and I feel I owe you more than I am ever likely to repay. Yet, if you want wealth, I believe I can put it in your way.—Do you know the northern bank of the

Orange River between the Great Falls and the sea?—No, I don't suppose you do, for very few people have ever trekked down it; still fewer have ever got down to the water from the great walls of desolate and precipitous mountain that environ its course; and except myself and two others, neither of whom can ever reveal its whereabouts, I believe no mortal soul upon this earth has ever set eyes upon the place I am going to tell you about. Listen!

In 1871, about the time the Diamond-Fields were discovered and people began to flock to Griqualand West, I was rather bitten with the mania, and for some months worked like a nigger on the Fields. During that time I got to know a good deal about stones. I soon tired of the life, however, and finally sold my claim and what diamonds I had acquired, fitted up a wagon, gathered together some native servants, and trekked again for those glorious hunting-grounds of the interior, glad enough to resume my old and ever-charming life. Amongst my servants was a little Bushman, Klaas by name, whom I afterwards found a perfect treasure at spooring and hunting. Like all true Bushmen, he was dauntless as a wounded lion and determined as a rhinoceros, which is saying a good deal. I suppose Klaas had had more varied experience of South African life than any native I ever met. Originally, he had come as a child from the borders of the Orange River, where he had been taken prisoner in a Boer foray, in which nearly all his relations were shot down. He had then been 'apprenticed' in the family of one of his captors, where he had acquired a certain knowledge of semi-civilised life. From the Boer family of the back country he had subsequently drifted farther down into the Colony, and thence into an elephant-hunter's retinue. The western Orange River and its mysteries—for it is a mysterious region—he knew, more afterwards discovered, better than any man in the world. Well, we trekked up to Matabeleland, and after some trouble got permission to hunt there; and a fine time we had, getting a quantity of ivory, and magnificent sport among lions, elephants, buffalo, rhinoceros, and all manner of smaller game.

Klaas, who was sometimes a bit too venturesome, got caught one day in the open by a black rhinoceros, a savage old bull. The old brute charged and slightly tossed him once, making a nasty gash in his thigh, but not fairly getting his horn under him; and was just turning to finish the poor little beggar, when I luckily nicked in. I had seen the business, and had had time to rush out on to the plain, and just as *Borele* charged at poor Klaas, to finish him off as he lay, I got up within forty yards, let drive, and, as luck would have it, dropped him with a 500 express bullet behind the shoulder. Even then, the fierce brute recovered himself, and tried to charge me in turn; but he was now disabled, and I soon settled his game. After that episode, Klaas proved himself about the only grateful native I ever heard of, and seemed as if he couldn't do enough for me.

Sometime after he had got over his wound, he came to me and said: 'Sieur! you said one day that you would like to know whether there are diamonds anywhere else than at New Rush (as Kimberley was then called). Well, sieur, I have

been working at New Rush, and I know what diamonds are like, and I can tell you where you can find as many of them in a week's search as you may like to pick up.'

'What do you mean, Klaas?' said I, turning sharply round, to see if the Bushman was joking. But, on the contrary, Klaas's little weazenized monkey-face wore an expression perfectly serious, and apparently truthful.

'Ja, sieur, it is truth. If ye will so trek with me to the Groot' [Orange] Rivier, three or four days beyond the Falls, I will show you a place where there are hundreds and hundreds of diamonds, big ones, too, many of them, to be found lying about in the gravel. I have played with them, and with other *mooi steins* too, often and often as a boy, when I used to poke about here and there up and down the Groot Rivier. My father and grandfather lived near the place I speak of; and I know the way to the valley where these diamonds are, well, though no one but myself knows of them; for I found them by chance, and, selfish-like, never told of my child's secret. I will take you to the place, if you like.'

'Are you really speaking truth, Klaas?' said I severely.

'Ja, ja! sieur; I am, I am!' he earnestly and vehemently reiterated.

'Well, Klaas,' said I at last, 'I believe you; and we'll trek down to the Orange Rivier, and see this wonderful diamond valley of yours.'

Shortly after this conversation, we came back to Shoshong, where I sold my ivory; and then, with empty wagon and the oxen refreshed by a good rest, set our faces for the river. From Shoshong in Bamangwato we went straight away across the south-eastern corner of the Kalahari in an oblique direction pointing south-west. It was a frightfully waterless and tedious journey, especially after passing the Langeberg, which we kept on our left hand. Towards the end of the journey we found no water at a fountain where we had expected to obtain it, and thereby lost four out of twenty-two oxen (for I had six spare ones); and at last, after trekking over a burning and most broken country, we were beyond measure thankful to strike the river some way below the Great Falls. Klaas had led us to a most lovely spot, where the ground slopes gradually to the river—the only place for perhaps thirty or forty miles where the water, shut in by mighty mountain walls, can be approached—and where we could rest and refresh ourselves and our oxen. Here we stopped four days. It was a perfect resting-place. Down the banks of the river, and following its course, grew charming avenues of willows, mimosa, and bastard ebony. Two or three islands densely clothed with bush and greenery dotted the broad and shining bosom of the mighty stream. Hippopotami wallowed quietly in the flood, and fish were plentiful. The mimosa was now in full bloom, and the sweet fragrance of its yellow flowers everywhere perfumed the air as we strolled by the river's brim.

I had some old scraps of fishing-tackle with me; and having cut myself a rod from a willow-tree, I employed some of my spare time in catching fish, and had, for South Africa—which, as you know, is not a great angling country—capital sport. The fish captured were a kind of flat-

headed barbel, fellows with dark greenish-olive backs and white bellies; and I caught them with scraps of meat, beads, grasshoppers, anything I could get hold of, as fast as I could pull them out, for an hour or two at a time.

After the parching and most harassing trek across the desert, our encampment seemed a terrestrial paradise. The guinea-fowls called constantly with pleasant metallic voices from among the trees that margined the river, and furnished capital banquets when required. Other feathered game and small antelopes were plentiful. At night, as I lay in my wagon contentedly looking into the starry blue, studded with a million points of fire, and mildly admiring the glorious effulgence of the greater constellations, I began to conjure up all sorts of dreams of the future, of which the bases and foundations were piles of diamonds culled from Klaas's wondrous valley.

Having recruited from the desert journey, and all, men and beasts, being in good heart and fettle, we presently started away down the river for the valley of diamonds. I had, besides Klaas, four other men as drivers, *voer-loopers*, and after-riders, and they, naturally enough, were extremely curious to know what on earth the 'Baas' could want to trek down the Orange River for—a country where no one came, and of which no one had ever even heard. I had to tell them that I was prospecting for a copper mine; for, as you probably know, there are many places in this region where that metal occurs. As we were doubtful whether we should find water at the next fountain that Klaas knew of, owing to the prevalence of drought, I filled the water *vats* and every other utensil I could think of; and then, all being ready and the oxen inspanned, we moved briskly forward.

We had now to make a *détour* to the right, away from the river, and for great part of a day picked our painful footsteps over a rough and semi-mountainous country. Towards evening, we emerged upon a dreary and interminable waste that lay outstretched before us, its far horizon barred in the dim distance by towering mountains, through which we should presently have to force our passage. That evening we outspanned in a howling wilderness of loose and scorching sand, upon which scarcely a bush or shrub found subsistence. Next night, more dead than alive, we halted beneath the loom of a gigantic mountain range, whose recesses we were to pierce on the following morning. Half a day beyond this barrier lay the valley of diamonds, as Klaas whispered to me after supper that night with gleaming excited eyes.

That night as we lay under the mountain was one of the most stifling I ever endured in South Africa, where, on the high tablelands of the interior, nights are usually cool and refreshing. Even the moist heat of the Zambesi Valley was not more trying than this torrid empty desert. The oven-like heat cast up all day from the sandy plain seemed to be returned at night by these sun-scorched rocks with redoubled intensity. Waterless we lay, sweltering in our misery, with blackened tongues and parched and cracking lips. The oxen seemed almost like dead things. Often have I inwardly thanked Pringle, the poet of South Africa, for his sweet and touching verse, written with the love of this strange wild land

deep in him, and for his striking descriptions of its beauties and its fauna. As I lay panting that night, cursing my luck and the folly that brought me thither, I lit a lantern and opened his glowing pages. What were almost the first lines to greet my gaze? These!

A region of emptiness, howling and drear,
Which man hath abandoned from famine and fear;
Which the snake and the lizard inhabit alone,
With the twilight bat from the yawning stone;
Where grass, nor herb, nor shrub takes root,
Save poisonous thorns that pierce the foot:
And here, while the night-winds around me sigh,
And the stars burn bright in the midnight sky,
As I sit apart by the desert stone,
Like Elijah at Horeb's cave alone,
'A still small voice' comes through the wild
(Like a father consoling his fretful child),
Which banishes bitterness, wrath, and fear,
Saying—'Man is distant, but God is near.

We hailed the passage of the mountains next morning with something akin to delight. Anything to banish the monotony of these last two days of burning toil. Klaas, as the only one of us who knew the country, directed our movements; and with hoarse shouts and re-echoing cracks from the mighty wagon-whip, slowly our caravan was set in motion. Our entrance to the mountains was effected through a narrow and extremely difficult pass, strewn with huge boulders, and overgrown with brush and underwood.

It would be tedious to relate all the labours of the trying trek among these awful mountain passes; but on the third day we had overcome the chief difficulties, and had outspanned for a final rest before completing our work, if to complete it were possible. Shading my eyes from the fierce sunlight, I looked upward at the long slope of mountain, broken here and there, and occasionally shaggy with bush. Over all the fierce atmosphere quivered, seething and dancing in the sun-blaze. I looked again with doubt and dismay at the gasping oxen, many of them lying foundered and almost dead from thirst and fatigue, and my spirits, usually brisk and unlagging, sank below zero. Klaas had told me previously of a most wonderful pool of water that lay on the crown of a mountain, where we should outspan finally before entering upon the portals of the diamond valley. Now he came to me and said, pointing upwards: 'Sieur, de sweet water lies yonder, *op de berg*. It is a beautiful pool, such as ye never saw the like of; if we reach it, we are saved, and the oxen will soon get round again. Ye must get them up somehow, even without the wagon.'

The tiny, yellow, blear-eyed Bushman, standing over me as I sat on a rock, pointing with his lean arm skywards, his anxious dirt-grimed face streaming with perspiration, was hardly the figure of an angel of hope; and yet at that moment he was an angel to me; for we had tasted no water to speak of for close on three days, and had had besides a frightfully trying trek.

We lay panting and grilling for an hour or more; and then I told my men that water in any quantity lay at the mountain top, and that we must at all hazards get the oxen up to it. Only a mile of ascent, or a little more, lay before us; but so feeble were the oxen, that we had the greatest difficulty to drive the bulk of them to the top, even without the encumbering wagon.

Three utterly refused to move, and were left behind. At last we reached the *krantz*, and after a hundred yards' walk upon its flat top, we came almost suddenly upon a most wonderful and, to us, most soul-thrilling sight.

A dense bush of mimosa-thorn and other shrubs grew around, here and there relieved by wide patches of open space. The oxen getting the breeze, and scenting water, suddenly began to display a most extraordinary freshness; up went their heads, their dull eyes brightened, and they trotted forwards to where the jungle apparently grew thickest. For a time they found no opening; but after following the circling wall of bush, at length a broad avenue was disclosed—an avenue doubtless worn smooth by the passage of elephants, rhinoceroses, and other mighty game; and then there fell upon our sight the most refreshing prospect that man ever gazed upon. Thirty yards down the opening there lay a great pool of water, about two hundred feet across at its narrowest point, and apparently of immense depth. The pool was circular, its sides were of rock and quartz, and completely inaccessible from every approach save that by which we had reached it. It was indeed completely encompassed by precipitous walls, about thirty feet in height, which defied the advent of any other living thing than a lizard or a rock-rabbit.

How the poor beasts drank of that cool pellucid flood, and how we human beings drank too! I thought we should never have finished. The oxen drank and drank till the water literally ran out of their mouths as they at last turned away. Then I cast off my clothes and plunged into the water. It was icy cold and most invigorating, and I swam and splashed to my heart's content. After my swim and a rest, I directed my men to fill the four buckets we had brought; and then, leaving the horses in charge of one of their number, I drove the cattle, both though they were to leave the water, back to the wagon, going very carefully, so as not to spill the water. At length we reached the valley, only to find two of our poor foundered bullocks lying nearly dead. The distant lowing of their refreshed comrades had, I think, warned them of good news, and the very smell of the water revived them; and after two buckets apiece of the cold draught had been gulped down their kiln-dried throats, they got up and shook themselves and rejoined their fellows.

We rested for a short time, and then inspanned and started for the upland pool. The oxen, worn and enfeebled though they were, had such a heart put into them by their drink, and seemed so well to know that their watery salvation lay up there, only a short mile distant, that they one and all bent gallantly to the yokes, and dragged their heavy burden to the margin of the bush-girt water. We now outspanned for the night, made strong fires, for the spoor of leopards was abundant, stewed some bustards, ate a good supper, and turned in.

I suppose we had not been asleep two hours when I was awakened by the sharp barks and yelping of my dogs, the kicks and scrambles of the oxen, and the shouts of the men. Snatching up my rifle and rushing out, I was just in time to see a firebrand hurled at some dark object that sped between the fires.

'What is it, Klaas?' I shouted. 'Allemaaghte! it is a tiger [leopard], sieur,' cried the Bushman, 'and he has clawed one of the dogs.'

True enough, on inspecting the yelping sufferer, Rooi-Kat, a brindled red dog, and one of the best of my pack, I found the poor wretch at its last gasp, with its throat and neck almost torn to ribbons. Cursing the sneaking cowardly leopard, I saw that the replenished fires blazed up, and again turned in.

It must have been about two o'clock in the morning—the coldest, the most silent, and the dreariest of the dark hours, that fatal hour betwixt night and day when many a flickering life, unloosed by death, slips from its moorings—when I was again startled from slumber by a most blood-curdling yell. Hunters, as you know, sleep light, and seem instinctively to be aware of what passes around them, even although apparently wrapped in the profoundest sleep. I knew in a moment that that agonised cry came from a human throat; and I rushed out. What a din was there, from dogs, men, and oxen, and above all those horrid human screams. I had my loaded rifle, and rushing up to a confused crowd struggling near the firelight, I saw what had happened. The youngest of my servants, a mere Bechuana boy, was hard and fast in the grip of an immense leopard, which was tearing with its cruel teeth at his throat. Klaas, bolder than his fellows, was lunging an assegai into the brute's ribs, seemingly without the smallest effect; others were thrashing it with firebrands; and the dogs were vainly worrying at its head and flanks. All this I saw instantaneously. Thrusting my followers aside, I ran up to the leopard, and, putting my rifle to its ear, fired. The express bullet did its work at once; the fiercest and most tenacious of the feline race could not refuse to yield its life with its head almost blown to atoms; and loosening its murderous hold, the brute fell dead. But too late! The poor Bechuana boy lay upon the sand, wounded to the death. After these horrors, sleep was banished, and as the gray light came up, we prepared for day.

The morning broke at length in rudest splendour; and as the *terrain* was slowly unfolded before my gaze, I realised the desolate magnificence of the country. Mountains, mountains, mountains of grim sublimity rolled everywhere around! Far away below, as I looked westward, a thin silvery line, only visible for a little space, told of the great river flowing to the sea, inexorably snat in by precipitous mountain walls that guaranteed for ever its awful solitude.

Klaas stood near, and as I gazed, he whispered, for my men were not far away: 'Sieur, yonder straight in front of you, five miles away, lie the diamonds. If we start directly after breakfast, we shall have four hours' hard climbing and walking to reach the valley.'

'All right, Klaas,' said I, 'Breakfast is nearly ready, and we'll start as soon as we have fed.'

Breakfast was soon over, and then I spoke to my men. I told them that I intended to stay at this pool for a few days, and that in the meantime I was going prospecting in the mountains bordering the river. I despatched two of them to go and hunt for mountain buck in the direction we had come from; the others

were to see that the oxen fed round about the water, where pasture was good and plentiful, and generally to look after the camp. For Klaas and myself, we should be away till dusk, perhaps even all night; but we did not wish to be followed or disturbed; and unless those at the camp heard my signal of four consecutive rifle-shots, they were on no account to attempt to follow up our spoor. My men by this time knew me and my ways well, and I was convinced that we should not be followed by prying eyes; and indeed, the lazy Africans were only too glad of an easy day in camp after their hard journey.

LOLLIPOPS.

WHEN some time since the announcement went the rounds that chemical science had lighted upon a new product named 'saccharine,' three hundred and sixty times sweeter than sugar, the statement was received with elation by the whole consuming community, housewives and young folks alike. But a distinct 'dampener'—to employ, appropriately in this connection, a metaphor of the kitchen—was put on the general jubilation when a little later it was ascertained that the cost of producing the new substance rendered it unable to compete in the domestic circle with its older and more firmly established rival. It was sufficiently disillusionising to learn that the new product was a derivative of coal-tar; but when it was declared for this reason to be an active antiseptic, and hence thoroughly innocuous, the last ray of joy disappeared, at least from the more juvenile section of those interested in such matters.

Natural as may be the taste for sugar, one shared by humanity with all the higher animals, the element of unwholesomeness would seem to play no small part in the fascination which is exercised by sweets over their consumers. If fashion has come to dethrone the lollipop of the schooldays of our fathers for the more refined *bonbon* of to-day, the favour enjoyed by both is founded on a taste common to the two generations; for there are fashions in lollipops as in other matters. Though the succulent hard-bake, the luscious brandy ball, and the ever triumphant toffee of half a century back, still proudly hold their position beside the more modern inventions of French confectionery, other sugary favourites of our fathers' youth have ceased even to be known by the names which to a generation gone by caused an involuntary handling of spare coppers in the disengaged pocket, and an aqueous deliquescence in the region of the salivary glands.

It speaks of an age gone by to hear of sweets which bore names of such portent as 'Napoleon's Ribs.' Who now knows the subtle secret of their careful confection, though the recollection of their flavour lingers yet in the memory of oldsters still happily among us? The inexorable decrees of fashion have dethroned 'Napoleon's Ribs' for the more modern chocolate cream, cocoa-nut ice, and the army of tempting caramels, *fondants*, *dragées*, and what not, which fill the sweet-shops in our city thoroughfares. Every reader of Thackeray remembers how dear old Colonel Newcome horrified his nephew by consuming an orange in genuine old-fashioned style in a box at Astley's; and so it is with the taste in lollipops, which by

that name are known no longer. Peppermint is voted 'low;' brandy balls plebeian and 'taboo,' except in the privacy of home; while there is nothing but what is essentially within the complicated canons of 'good form' in the consumption of chocolate creams.

As a nation, it is clear that we are growing in a taste for lollipops, and soon the sweet-shop will assume with us as much the dignity of a national institution as does the 'candy' store across the Atlantic. Candy and ice-cream, among a few other temporary enjoyments, such as tobogganing, sleighing, and base-ball, constitute the earthly paradise of the youthful American of both sexes; 'candy' being a comprehensive term, including the whole sweep of sugary products known in the old country as 'sweets.' In more homely transatlantic circles, a 'candy-pulling,' the simple entertainment accompanying the production of that form of goody known as 'cream-candy,' is one of the most popular of domestic dissipations. In its fun it decidedly compares favourably with the usually surreptitious manufacture of toffee by the younger members of an English household, generally carried out with the connivance of the servants. Yet toffee is as much a national sweet with English people as candy is with Americans. On the Continent, strange to say, toffee is unknown in any of its forms; yet our neighbours across the Channel possess their own national *boubons*, and ill advised would be any one who disclaimed the fascinations of the skilfully constructed *fondant* or the artfully prepared *dragée*, which the beneficent, rather perhaps more correctly, the benevolent action of the lately much-discussed sugar bounties enables English consumers to purchase at every grocer's shop at a fourth the cost at which precisely the same article can be found in the very expensive *confiseries* of the Paris boulevards.

It is of course due to the cheapness of sugar that we have come to be so much larger consumers of lollipops than formerly. Sweets which once were made by some good old dame in the quiet of her back kitchen, are now 'manufactured' by machinery; they fill up whole windows in piles which surpass the wildest dreams of the childhood of a generation gone by. Lollipops which used to be purchased by the ounce are now retailed by the pound. This is indeed a revolution. Perhaps, however, like most revolutions, it will produce its own reaction, and cloy that insatiable craving for sweets against which parents are so loud in their denunciations. It is a process which never fails in its application, that when a grocer engages a new shopboy he is usually allowed by his employer to help himself freely to the tempting stores of sweet stuff placed within his reach. By the unfailing influence of that equilibrium which science informs us Nature never fails to restore whenever it is disturbed, the new apprentice finds within a week, amidst the surrounding occupations of his lot, that philosophic calm which can ill be understood by those unacquainted with the painful process of education through which the humble stoic of the counter has successfully passed.

It is easy to see the objections which parents bring against the consumption of sweets. Apart from the purely side issues of danger from adulteration and poisonous colouring matter,

the action of sweets is to interfere with the healthy appetite for nutritious food, on which the growth of childhood so largely depends. It was a shrewd knowledge of this simple physiological fact which, it will be remembered, was put to such use by Mrs Squeers in her generous administration of brimstone and treacle to the pupils at Dotheboys Hall. It is not till children have received some severe lesson from an unwise indulgence in a variety of sweets, topped off perhaps by a surfeit of ginger beer, as manufactured for the juvenile market, that an experience is gained, the results of which suffice for the rest of their natural life. There are none the less people who retain their taste for sweets far into advancing years, but it will be chiefly found to be those who indulge in no stimulants. This is the reason why men usually hold sweets in such pitying detestation, while women at all ages retain their youthful love of 'goodies.' Of late years, however, the medical profession has joined the ranks of those who declaim against sweets. Indeed, so successfully has the injurious action of sugar been explained, that it is surprising how many persons, nowadays, even children, refuse sugar in their tea. But though doctors may declaim against the effects of sugar and of sweets generally, in the case of those suffering from the many forms of eczema now so prevalent, we may feel sure that the taste for lollipops will long continue, founded as it is on one of the instinctive cravings of human nature.

THE OROTAVA MURDER.

As the murder occurred while I was on a visit to my friend the English vice-consul in Orotava, I took an interest in it that was both personal and professional. Alonso, the victim, was an agreeable boy. He had done me various kindnesses. He possessed the engaging suavity of manners that characterises the Spanish race; and he was the English vice-consul's clerk. Thus, when it was surmised that he had been put out of the way, we had good reason to think of him with regret.

I will tell the tale as circumstantially as possible. To an Englishman familiar with the English criminal courts, it will not seem remarkable. But it made a sensation in Tenerife, where murder is rare, notwithstanding the hot blood that may be supposed to run in the veins of the descendants of those rough old warriors of Spain who in the fifteenth and sixteenth centuries colonised the Canary Islands. A thick octavo volume on the subject was written and printed; and locally, the Orotava murder is still mentioned with serious looks and soft tongues.

It was the evening of an April day; we had just finished dinner, and the vice-consul and I were smoking on the roof of the house in the dry warm atmosphere, when there came a ring at the door. Canarian doors are so made that, when pushed, several little bells tinkle one after the other or all at once; and this sound floated up to us from the inner court.

'Who is there?' called the vice-consul from the roof.

'*Gente de paz*' (a peaceful person) was the conventional reply, in a woman's voice.—'Is my son here, señor?' she continued.

'What! Alonso? Has he not got home yet? He left the vice-consulate at four o'clock, and it is now seven.' This my friend shouted to the woman, who had nothing to say in rejoinder.

'I do not know, señor. He has not come. Ave Maria! the boy was never so late before.'

'There must be something wrong,' remarked the vice-consul to me. 'I do not suppose Alonso has really gone off in the steamer outside the port; but he might have done so. I gave him a bag with five hundred old dollars in it, to take to Don Carmon, never dreaming that there was any risk.'

'Oh!' said I to this; and immediately a long vista of grim or serious possibilities rose up in my imagination. I had not a word of comfort to offer to my friend.

Well, we descended to the orange and lemon trees in the court, and then returned with the woman to her house. But no Alonso was there. From the boy's house we walked to Don Carmon's. Don Carmon was a rich merchant with a taste for curios. The vice-consul had promised to save for him all the old Spanish dollar pieces he could lay hands upon. Two days ago, he had been paid a bill almost wholly in these obsolete coins, and this money with the other accumulations was what Alonso the clerk had been bidden to take to the merchant.

'No; he has not been here,' said Don Carmon, when he was interrogated. '*Caramba!* it has a bad look.'

We all agreed in this. However, for the poor woman's sake, we tried to make light of the boy's disappearance, and spoke of his return home as a thing of course. Nevertheless, Alonso was never afterwards seen alive; nor were the five hundred dollars recovered.

Of course, the Orotava police were requisitioned to unravel the mystery that environed the matter. But they were so unused to criminal cases, real or supposititious, of this kind, that they did nothing. 'What would you have?' they asked of the vice-consul, when he blamed them because no elucidation was offered. 'Without doubt, the boy has turned into a thief. Five hundred dollars is much money, and with it he might go to America, or England, or where you please, to make his fortune.'

This was true. In their customary Spanish neglect of method, they had allowed several transatlantic steamers to leave Santa Cruz before it occurred to them that it might be well to subject all island passengers on these ships to a police inspection. Of course the boy had gone. There was nothing left to do except get a new clerk, and bid the boy's mother thank Heaven she was never more likely to see the face of her wicked and unfilial son. But the woman was firm in maintaining Alonso's integrity. 'God knows he was good,' she said. 'He could not steal. He is dead, and some one has killed him.'

A month passed, and Alonso was fast being forgotten, when, by a chance incident, the boy's mother was proved to be just in her asser-

tions and suspicions. Donna Concepcion Varda y Ro, the rich widow of an advocate, who had retired to Orotava to spend his last days in peace and comfort, died, and had to be buried. There was a great crowd at the funeral. Many people could not get into the little cemetery, and had to stand outside, looking at the swaying fronds of the palm-trees that grew among the graves within the walls. With those who were able to follow the coffin was a certain old beggar-man. He was blind, and was led by a little girl. The old man had received much charitable help from the advocate's widow, and now meant to show his esteem for her. But the child to whom he was tethered soon became restless when they were in the cemetery, and finally guided him to a secluded corner where he could sit down awhile in safety by himself. She then ran away to join the crowd and watch the undertakers fill Donna Concepcion's coffin with quicklime, as is the custom in Spanish countries.

In the meantime, the old man became sensible of a very nauseous smell in his vicinity. He tried to move away, but only succeeded in tumbling down and hurting himself. He could not escape the bad odour. It came from a dead body—there was no question about that. But as all regular interments like Donna Concepcion's were accompanied by the heaping of quicklime over every part of the body, in order to counteract the fumes of slow putrefaction, the old man naturally wondered. When the child returned to him, he bade her look about and see if she could see anything to which the smell might be attributed. 'I should not be surprised,' he remarked half jokingly, 'if young Alonso is here, after all.'

The girl had no difficulty in localising the smell. It came from a square stone vault, which had hitherto been empty and neglected for a long time. A swarm of blue-bottle flies buzzed round the wide fissures of the tomb. The child peeped inside, and then, much frightened, told the blind man that she could see a body in its clothes lying in a heap at the bottom of the vault.

'Oh, it is Don Alonso without doubt,' said the beggar, as they moved away and out of the burying-ground.

At first, no credence was given to the light talk of this poor mendicant. But when it reached the ears of Alonso's mother, she took the matter up, and formally petitioned that an investigation might be made. It was made: and the body was at once recognised as that of Alonso. The skull had been beaten in, and marks of stabbing were found in different parts of the trunk. It was therefore unmistakably a case of murder. Moreover, the absence of blood-stains in the vault or the cemetery itself seemed to imply that the murder had been committed elsewhere, and that only as an afterthought had the body been carried into the cemetery. Of course, the money was not to be seen. Thus, the motive of the crime was sufficiently manifest.

The police were greatly excited over this discovery. They had ridiculed the blind man's tale until it was verified, and had treated the words of Alonso's mother as so much senile maundering. They had it upon their honour, therefore, to atone for their errors by unexampled sagacity in tracking the murderers.

Now, in the whole community of Port Orotava there were but two rogues whom all the world held to be rogues. They were José Zamorra, a mason, and Pedro Martínez, a baker's assistant. The police thought they could not do better than arrest these men without loss of time. The priests shook their heads at Zamorra and Martínez; no young girl would walk with them; and had they not been clever workmen, though dissolute men, their employers would have joined the others in ostracising them. But when it came to evidence, there was none. The men had been away from their work at the supposed time of the murder; but then they never worked after five. They had not been seen in the streets of the town either; but the streets of Orotava are always desolate, and this was no evidence. Their wives spoke for them, swearing to everything that seemed favourable to them, though with a quenched and hangdog demeanour and a constant mutter of religious expletives that appeared odd. And lastly, to complete the proof of their innocence, it was shown that these two men were in the Casino by the seashore before six o'clock. Witnesses remembered the clean shirts worn by the men on this occasion and the reckless oaths they used; and it was asked, how could men who had killed another man and carried him off to the cemetery, by any human endeavour be at the club as they were, and behave as they did, with such a tedious piece of crime on their hands, and such a devil's weight upon their consciences? In short, Zamorra and Martínez met their examiners with a bold face, and were dismissed from the court stainless as to the murder.

Two or three weeks later, the investigation entered upon a new phase. One of the police was accustomed to ramble along by the seashore, where the rough edges of the black lava rocks stand sharply towards the water. During his promenade one evening, he noticed the blue and white enamel plate of a house-number lying on the top of a flat piece of stone. In his absorption and displeasure—for he was thinking about the murder, and wondering whom he could arrest—he kicked the piece of enamel as far as he could, and sat down on the rock. The following evening he took the same walk, and to his confusion he found the enamelled number which he had spurned away replaced on the rock. Then he seated himself and thought awhile. What was the meaning of it? He could not say. However, he pocketed the number. As he was about to go home, the fancy came to him to overturn the stone on which he had been sitting. He did so, and was much gratified to find that the reverse side of the slab was broadly dyed with what could not be other than blood-stains. He was then convinced that he had two vital links in the chain of criminality that was to garrote somebody.

The enamel plate was curiously illustrative of the dislike which one Spaniard has personally to bring another into trouble. A certain man had been an involuntary witness of the murder. Would he admit this before all the world? For many reasons, no. Nevertheless, he wished the murderers to be punished. To attain this end, he abstracted the doorplate from the house of one of the felons, and placed it where it might bear silent but adequate testimony for the first

intelligent passer-by to make more of. Upon the evidence of his doorplate—for it was his—Martínez was rearrested. Zamorra shared his fate, and they were both incarcerated in separate cells in the city prison.

It was terribly humiliating to the strong arm of the law when it transpired that even with the help of the doorplate there was not a sufficiency of evidence against these men. No one doubted that they had killed the boy, and yet they could not be made to pay the penalty. In this dilemma, recourse was had to a plan much favoured by the old Inquisition, but which a sheriff of England might well be aghast at. The prison officials were bidden to tell each of the felons that the other had confessed the whole story, and that only by similar confession could any hope of mercy be anticipated. Martínez then straightway declared that Zamorra had done the killing; he had only helped Zamorra to bury the body. Zamorra, on his part, swore that it was by accident he met Martínez, when Martínez had completed the murder, and wanted an assistant to hide the signs of his crime. Such were their respective tales at the outset. After a while, however, when each realised that there was no hope, a general confession was made, that they might at any rate begin their long spell of purgatory unshackled by those latest lies.

This was the gist of their story: They had wanted money to pay their debts, contracted at cards and cock-fights. They had intelligence of Alonso's movements on the evening of his death. Martínez seduced the boy towards the lava beach, where Zamorra joined him in stunning and stabbing the poor fellow. They then dragged the body towards the sea, hoping that the tide would eventually float it away from Tenerife. This done, they recognised the need of an *alibi*, if it came to the worst; and, parting, they hurried home, changed their clothes, and presented themselves at the club, behaving in such a manner that the other members would be able to recall their presence on that particular evening. Early on the following day they returned to the beach, and found the body still there. They then chose their time for taking it to the cemetery, where they threw it into the disused vault by which the old blind man had seated himself. After this, all they had to do was to turn the stone upon which Alonso's body had lain during the night, and face the world with what effrontery they could muster. It had to be confessed that they had schemed with fair success up to the time when Martínez's doorplate was used against him.

The last scene in the tragedy was acted one July morning about three months after the murder. I joined the vice-consul, who in his official capacity formed one of the procession attendant upon the two felons on their way to execution. We passed through the Orotava streets, over their slippery grass-grown cobbles, and under the tearful gaze of many a native woman standing at the door of her house. The priest murmured a litany for the dead; and the half-dozen acolytes, all in black, who echoed the responses, laughed and chatted with the ease that is characteristic of them at a funeral. Thus we continued until we reached the seashore and the exact spot where it was surmised the boy Alonso

had come to his end. Here the heavy wooden chair of the garrote was already in its place, and ropes and a thick stave lay on the ground close by. The executioner was a strong fellow, though nervous. Martínez was the first to die. It was a disagreeable spectacle, and one I do not wish to repeat. A quite indescribable cry gurgled from the man's throat when the executioner twisted the rope; then his eyes started from their sockets, and he was dead, though quivering. Zamorra followed him, and died in the same way.

A NEW SUBSTITUTE FOR GLASS.

The introduction of a material combining all the advantages of glass with none of the corresponding disadvantages arising from its brittleness will be hailed with interest by every class of the public, who suffer daily in one form or another from the fragile nature of the article it is now sought to supersede. The transparent wire-wove roofing, which is translucent, pliable as leather, and unbreakable, has for its basis a web of fine iron wire, with warp and weft threads about one-twelfth of an inch apart. This netting is covered on both sides with a thick translucent varnish, containing a large percentage of linseed oil. The process of manufacture is conducted by dipping the sheets into deep tanks containing the composition until the required thickness is obtained; the sheets are then dried in a heated chamber, and after being stored for some time till thoroughly set, are ready for use. The sheets can be made any colour desired, and range from amber to pale brown. The roofing is very pliable; and bending backwards and forwards without any injury, readily adapts itself to curves or angles in roofing. The new material is not only waterproof, but is unaffected by steam, the heat of the sun, frost, hail, rain, or indeed atmospheric changes of any kind. Being a non-conductor, buildings, winter-gardens, and similar structures remain cool in summer and warm in winter. Owing to its lightness as compared with glass—only half a pound per square foot—considerable economy in the iron or timber framing designed to carry it can be secured, whilst saving in carriage is obtained in addition to safety.

Turning now to the question of cost. Wire-wove roofing is more expensive in first cost than ordinary glass; but the many advantages, both in erection and maintenance, already set forth will, in the opinion of those interested in the question, more than counterbalance the primary additional outlay. A material that requires no glazing, can be cut with scissors and fixed with zinc nails, is an economical one to erect. For churches, passages, staircases, special coloured varieties to simulate glass similarly prepared are manufactured. Both the Admiralty and the War Office have availed themselves of the advantages to be derived from the employment of the new roofing material; whilst it may be added that the Royal Aquarium at Westminster is entirely covered with it.

A list of the many and varied uses to which the wire-wove roofing may be applied would be a

long one; amongst others, may be mentioned: Roofs of cotton mills, explosive and other factories, workshops of all classes, breweries, printing-works, railway stations, exhibitions, cricket pavilions, lawn-tennis courts, verandas, porches and covered ways, bathhouses, engine-room skylights, conservatories, ferneries, garden-frames and summer-houses, kiosks, stables, loose-boxes for horses and cattle, barns, cowhouses and shepherds' houses, pheasantries, poultry-runs, fowl-houses and kennels, skylights, markets, schools, laundries, portable buildings, temporary structures, hospital and military huts, and all other buildings requiring to be light and dry.

WARFARE.

I.

My hand has lost its cunning and its power;
I cannot fight;
My arm hangs helpless, like a wounded flower,
Killed by a blight!
My tendons, once of steel, are limp and shrunk—
Each yields, and bends;
My iron frame is like the blasted trunk
That lightning rends!

II.

And where my armour? Is it also gone?
I wake to find
That I am standing here, disarmed, alone—
With youth behind—
And strength, and beauty, and all else that dies,
Locked chill in death—
Gone! like a vision of the night, that flies
At Morn's first breath!

III.

What has my warfare brought me? What great gain?
How much renown?
Where are my trophies? Where my conquered slain?
And where my crown?
What are my victories, that I should share
The victor's seat?
I fought as one who vainly beats the air,
And gained—defeat!

IV.

And this the end is! this the climax grand!
The acme won—
The final downfall of a house of sand,
The last road run!
And what my profits are, I ask in vain,
For none are shown;
Nothing is left that I can count as gain,
Or call my own.

V.

I toyed with shadows, while the sands of Time
Rolled swiftly on;
And said not, 'This is youth,' until its prime
Was past and gone!
And now, in shame, before the Head Supreme,
With garments rent,
I crave for grace, that I may yet redeem
The time misspent!

THE MANCHESTER SHIP CANAL.

Nor more than one hundred and thirty years ago, the roads of England were pronounced the worst in Europe, and not a single mile of canal—as canals are now understood—had been made. The wonderful growth of commerce and the industrial arts from about that time received its first and greatest impulse from the construction of the Bridgewater Canal, between Manchester and Liverpool; and Manchester may fairly claim the proud distinction of being the pioneer in opening up this country to commerce and manufactures by means of improved internal communications.

From the day on which the Bridgewater Canal was opened, the cost of carriage of goods was reduced by three-fourths, and immediately, as if by magic, the change began. The trade of Manchester and the surrounding district grew by leaps and bounds, until, instead of receiving the bulk of our supplies from the Continent, as formerly, the habitable world has been ransacked to find new markets for our productions; and within the following fifty years three thousand miles of canal were made at a cost of fifty million pounds sterling.

Fifty years after the opening of the Bridgewater Canal, Manchester entered on a second enterprise of a similar kind and for a similar purpose; and the first really successful railway was made: the pioneer of a system of iron roads surpassing all that the world has ever seen. Strangely enough, one of the principal objections to railways was, that the canals, made after so much trouble and expense, would be ruined; and it was gravely proposed by an eminent engineer to fill up the canals and convert them into railways; but the canals have more than proved that they can compete successfully with railways; and for raw material and the heavier class of goods are a far less costly means of conveyance than any other in existence.

The enormous expansion of commerce within this century has been in no small measure due

to canals. Without the means of distribution, commerce cannot exist, for facilities create trade. Until very recently, this country, from her manufacturing skill, and as the inventor and maker of the finest machinery in existence, has controlled the carrying-trade of the world, and competition outside of these islands was scarcely thought of. But we have found, somewhat to our surprise, that our competitors have been working diligently; that they have got and now make our best machines, and that their operatives work more hours in the day for much less remuneration. By more active canvassing for orders, by studying the requirements of customers, and by paying less for the carriage of goods, the foreigner, we find, is competing with us on more than favourable conditions. The English manufacturers and merchants have had to learn that not only abroad, but also in the home market, they were being undersold, and they began to inquire into the reason. In addition to the causes enumerated, it was found that the internal carrying-trade of the country was entirely monopolised by the railways, including carriage by canal; and a comprehensive Report, published by the Associated Chambers of Commerce in 1885, showed that the rates for carriage of goods in this country were on an average fully twice as much as those paid by our continental rivals.

But in addition to this keen competition, Manchester and the surrounding districts are suffering from obstructions which they have long complained of and sought to mitigate, but hitherto in vain, and which were thus characterised recently in the *Times*: 'Five millions and a half of people are at the mercy of a combination, holding a pass between them and the rest of the human race, and making the same use of their coign of vantage as the medieval barons did in the embattled toll-gates, thrown across the world's highways. City, port, dock, and railway vie in extortion, and levy duties to the extent of human forbearance. Many millions of tons of material and manufactures pass annually to and fro between the port and the industrious region at

the back; and on every ton, Liverpool has its profit.' This is a heavy indictment of Liverpool; but the fact is, in the past, and under the prosperous times long enjoyed by that port, responsibilities were accepted, reasonable enough at the time, but found to be now, under more stringent conditions, to say the least, burdensome.

Liverpool is not a manufacturing city; she is the result of the great industrial centre behind; but, unfortunately, owing to the responsibilities of the Mersey Dock and Harbour Board, it is impossible for that trust to make such concessions as regards their existing tariffs as will satisfy Manchester, and which that city is convinced will be secured by the Ship Canal. The railways also, with all the intermediate carriers, porters, &c., must have their profit. Mr George Findlay, Manager of the London and North-western Railway, stated before parliament, that out of 9s. 2d. per ton for carriage of a certain class of goods to Manchester, his Company received 1s. 9d., recently reduced to 1s. 2d., the remainder going for charges and dues in Liverpool. But whatever the cause may be, the contention of Manchester is, that goods are brought from the furthest ends of the earth to within a few miles of their destination, and then the heaviest portion of the expense and delay begins. It was clearly shown, during the parliamentary inquiry into the merits of the Ship Canal, that where there is a difference of several days in the length of a voyage, no extra charge is made, even when that difference amounts to so much as ten days; therefore it ought to cost no more for carriage by water to Manchester than it does now to Liverpool. Besides this saving, there are various other economies contemplated by the advocates of the Ship Canal scheme. As the largest vessels will be able to enter or leave the canal at any state of the tide; one of the principal causes of delay is avoided, as also the expense of 'breaking bulk' and transshipment to railways, with the risk of damage or deterioration.

There is no doubt that Manchester is amply justified in her contention that the canal will give her a new lease of prosperity, and the power to maintain her high position in the industrial world. The construction of the canal is now in progress, and is being pushed forward with great energy and vigour by the contractor, Mr Walker of London, a gentleman who has shown a rare combination of judgment and skill in the selection of plant for carrying on the work; and by means of which it can be seen how effectually steam-machinery can be made to do work of this kind. The work has now been going on for over twelve months, and it is confidently stated that Mr Walker is well forward with the proportion of work expected to be executed within that time. The canal is to be thirty-five miles in length, and is being constructed in sections, some of which are nearly ready to be connected in such a way as will facilitate the work by

laying continuous railway tracks. There are no great engineering problems to be solved, not even such—comparing a large enterprise with a much smaller one—as Brindley had to overcome with his limited means and experience, in the making of the Bridgewater Canal last century. It is undoubtedly a gigantic undertaking, even in these days of great schemes; yet what particularly astonishes the visitor is the absence of the large armies of men which are usually seen on great works of a similar description. On one of the sections near Manchester about twelve hundred men are employed, distributed over the section, about four miles in length, with three large docks in progress. But in place of employing manual labour for the excavations, five powerful 'steam navvies' of various nationalities can be seen at work from one place; besides a large 'steam-dredger,' similar to what may be seen dredging at the entrances to harbours, mounted on a large truck, on rails laid along the side of the cutting. This machine is said to be the most powerful excavator in existence. It lifts and empties into a truck four cubic yards of clay every minute, and twenty trucks are filled and removed in ten minutes. The machine is continually moving forward. Steam-machinery seems to be adapted to all kinds of work, and the men are chiefly engaged in attending to it, or performing such labour as is unworthy of its attention. On all hands, steam is the universal servant: a perfect network of rails covers the ground, reminding us of a great railway terminus; while locomotives, steam-navvies, steam-cranes, and steam-pumps at full work, present a scene of activity and energy seldom witnessed. On the different sections there are fifteen thousand horsepower at work in the various forms of steam-machinery, which will at least represent the work of one hundred thousand men; and when we consider that the amount of material to be excavated and removed is forty-eight million cubic yards of clay and six million cubic yards of rock, the gigantic character of the undertaking will be appreciated.

But such large quantities in figures convey only an imperfect meaning of their vastness to ordinary readers; perhaps it will be better understood by stating that the quantity named would make a wall round the earth, on the equatorial line, about six feet high and two feet thick. Up to the present time fully one million cubic yards of soil have been removed per month. It is calculated that one of the 'navvies' removes between sixty and seventy thousand cubic yards in the same time.

While agencies so powerful are in operation excavating this enormous quantity of material, we may glance at the work to be done in detail. The canal is not a very long one, being, as we have said, thirty-five miles. Its sectional dimensions will be three hundred feet wide on the surface—or nearly twice the width of the Suez

Canal; the bottom one hundred and twenty feet wide; with a depth of twenty-six feet. The starting-point is at Eastham, on the river Mersey; and the sill of the entrance dock is eleven feet below the level of the deepest dock in Liverpool, thus making the canal independent of the state of the tide. The speed of vessels passing through it is estimated at five miles per hour; and all the usual causes of delay being avoided, the largest steamer may reach Manchester while another is waiting for the tide to enter the docks in Liverpool.

On entering the tidal dock at Eastham there is a rise of twenty-two feet from low-tide by means of a lock. Twenty-two miles farther, the second lock, with a rise of sixteen feet, is reached, at Latchford. Seven miles more brings the third lock, which again lifts fourteen feet, at Irlam. Two miles, a fourth lock, fourteen feet. Old Trafford is the next lock, four miles distant, with a rise of sixteen feet, or a total height above the Mersey of sixty feet. These sections or divisions will have at each terminus three locks, parallel to each other, and of dimensions suited to the various sizes of vessels. By this means unnecessary labour and waste of compensation water will be avoided.

The canal may be almost considered one long continuous dock; and with the exception of the north bank, between Eastham and Runcorn, a distance of twelve miles, which is bounded by the Mersey, the whole of the two banks may be made available for quayage accommodation, equal to a distance of fifty-eight miles, and at any point of which vessels may be loaded or discharged. The facilities that are offered in this way are sure to draw a large number of new industries, for manufacturers are certain to seek advantageous situations. The Canal Company have very wisely secured at a moderate price a large portion of the land along both banks of the canal, chiefly with a view to this demand, and his land is certain to increase in value when the canal is completed. In this connection, greater facilities will be afforded than any mere tidal river or arm of the sea can give; and during the last few years, many large industries which have hitherto been carried on successfully in the midland counties have been removed to the coast, to secure advantages similar, though inferior, to those offered by the Ship Canal.

The docks are intended to occupy a large area, placed at different stations, but especially at Old Trafford—a suburb of Manchester—and at the Pomona Docks, which are situated near the heart of Manchester. There are three very large docks at Old Trafford, the largest of which is seventeen hundred feet long, by two hundred and fifty wide. The remaining two are smaller, and with the exception of the walls, are not far from completion. The newest and best arrangements for loading and discharging vessels will be provided. The dock walls are on such a scale as would be in

themselves a large contract. They are to be made of concrete, and will be on an average fifteen feet thick, to be faced with cement, and covered with large blocks of granite weighing several tons each. The walls will thus be practically one solid mass, several miles in length. All the walls, including those for the several locks, and the entrance dock of the river Mersey, will be constructed in the same way. The stone used in the building of the walls is nearly all obtained from the excavations at the entrance dock.

There will probably be twelve thousand men employed in a short time on the works, besides boys; and this implies a great increase in the excavating machines, as, notwithstanding the progress made in the past, the contractor is determined to push on the work with still greater speed. Mr Walker, in connection with the completion, has undertaken to pay one hundred pounds for every day that he requires after the stipulated time; and the Company on the other hand will pay him a like sum for every day he can finish the canal before the time agreed on. The Ship Canal is truly a work of great interest and importance. We have only glanced at the quantity of work to be done, besides which there are deviations of the lines of railways and of the course of rivers to be made—no small amount of work in themselves. Already there is a prospect of new canals being constructed, with improved details, connecting those districts with the Ship Canal which are at present outside of canal accommodation, all of which will serve as feeders for the main artery leading to the sea.

It is pleasing to record that Mr Walker has shown a fine spirit in dealing with his employees. At all the different sections are schools, lecture and mission halls. Social meetings and temperance lectures are held regularly. At each section a clean and well-ventilated hospital, with matrons and trained nurses, is established. Fortunately so far the work has made great progress with but very few accidents, considering the large quantity of powerful machinery in operation and the inexperience of the men, at the beginning of the work.

A great deal of the opposition to the canal scheme arose from want of a clear understanding as to the basis of calculation on which is founded the prospect of its being a remunerative investment. It is quite evident that neither the Mersey Harbour Board nor the railways, bound as they are, can make such reduction on their rates and charges as will give the relief required, or as it is anticipated will be obtained from the Ship Canal. The promoters base their calculations on the present average tonnage, with charges equal to one half of what are now being paid to Liverpool and for carriage between the two cities. It is maintained that the Ship Canal, while conferring advantageous benefits on the populous centres which it will accommodate, will do so without injury to existing interests. Throughout the severe parliamentary contest, it was urged by the promoters that its operation must improve rather than prejudice the development of the port of Liverpool, and the great carrying Companies interested will have in addition the collection and distribution of the enormous traffic brought forward by the greater facilities and cheapness

offered by the Ship Canal. The effect of the creation of a new port in the most populous district and in the heart of the kingdom will be to increase new industries and enlarge commerce.

JOHN VALE'S GUARDIAN.

CHAPTER VII.

HOWEVER fully Mr Robert Snelling was bent upon doing his duty by his orphan charge, he was not able to set all his benevolent machinery at once in motion. The Christmas holidays stretched a merciful interval between John and schooldays, and Uncle Robert had too righteous a fear of public opinion to begin immediately to press the boy with home lessons to such an extent as to make life an actual burden to him. The boy's state of mind was critical and curious, and Uncle Robert was not quite the man to understand it. But as no intimate knowledge of the art of watch-making, for instance, is needed to enable any clumsy fellow to spoil for good and all the most delicate mechanism, so no great power of penetration was necessary to Snelling's plan. It was part of his method to have John a good deal on evidence, and to draw pitying attention to his moaning vacant ways.

'Upon my word,' he would say, 'I don't know what I shall make o' the lad at all. I'm sore afraid he'll never be good for much. It would ha' been a grief to his father to have seen him i' this state; and it's my belief he gets worse every day.'

He had found, dull as he was, that an ostentatious pity had more effect upon the boy than the most open bullying, and this discovery pleased him greatly. Nature played into his hands. Knowing—in spite of the hourly renewed veil of respectability which he hung between his motive and himself—what a thorough-going villainy he was bent upon, he was naturally very careful of public opinion, and it was so much safer to pity than to bully, that in a little while he gave himself wholly over to that course.

'Dear, dear!' he would say, when once he had blundered on the use of this unexpected weapon. 'It's a dreadful pity you got that knock on the head, John; I'm afraid it's made next door to a fool of you for life.—D'ye feel it anywhere? What is it? What's it like?'

This sort of thing was doubly effective before strangers, because it threw John into a dreadful state of helpless vacancy, and at the same time helped to establish Uncle Robert's reputation for gentleness of heart, and showed how sad he was over the boy's misfortune. But Mr Snelling expected schoolmaster Macfarlane to be of great assistance to him, and looked forward anxiously to the re-opening of the school. A day or two before the time appointed for that event, his business led him by Macfarlane's residence, and he made a call upon him. 'I've called,' he said, when he had taken his seat in the schoolmaster's little parlour, 'to have a word or two about this poor young nephew of mine, Mr Macfarlane. I'm afraid as of late he has been a bit back'ard in his studies.'

'That is certainly the case, Mr Snelling,' said Macfarlane; 'but I must ask you to take into

consideration the fact that the late Mr Vale particularly desired that the boy should not be pressed forward too rapidly.'

'Please, understand,' Snelling answered with a wooden condescension, 'that I am not ablaming you, sir. I am fully aware of Mr Vale's desire. But the youth is now in my hands, and I am desirous to see him pushed forrad a little faster. I am now his guardian, and I feel the responsibility hang upon me pretty heavy.'

'That is quite natural, Mr Snelling,' returned the schoolmaster.

'I don't want to be told, sir, whether it is natural or no,' said Snelling. 'Maybe everybody would feel the responsibility as heavy as I do; maybe they would not. That, sir, is neither here nor there. The point with me is, as I do feel the responsibility, and as I desire to discharge it.'

'Exactly so,' replied Macfarlane.

Mr Snelling looked as if he would have liked to contradict him, but on reflection seemed to think better of it. 'Having had the b'y,' he proceeded heavily—'having had the b'y under my care sence a considerable while before his father's death, I have been able to come to a bit of a judgment upon his character.'

'Precisely,' said the schoolmaster.

Again Mr Snelling looked as if he would like to defy the schoolmaster, and again, not seeing his way to it, he suppressed himself. 'His father's opinion was,' he continued, his solemn drawl and decisive snap growing more solemn and more decisive, 'as the condition of the b'y's mind was such as would not bear with pressure.'

'Just so,' said Macfarlane, and this time Snelling saw his chance and stopped him.

'No, sir; it is not just so. It is not just so, nor anything like just so, if my opinion is to be took at any value.'

'If you should counsel the pursuit of another method, Mr Snelling?'

'If I should counsel the pursuit of another method,' Snelling broke in, 'you can hear what I've got to say in case you should care to listen to it. If not, I daresay I shall be able to find a place where the lad can learn as much maybe as you could teach him.'

'I beg your pardon, Mr Snelling,' said the schoolmaster submissively; 'I simply intended to signify my general agreement with the principles you were laying down.'

'You can signify your general agreement, sir,' Mr Snelling answered with his own dull dignity, 'when you know what them principles amount to.'

Macfarlane could not afford to quarrel with his visitor, and was, indeed, as a general thing, too discreet to quarrel with people who were stronger than he was, or who could in any way be either of damage or service to him. He kept silence, therefore, and listened, smilingly attentive, whilst Snelling expounded his views.

'As a teacher of youth,' that ponderous personage continued, 'you are likely to be acquainted with the fable of the hare and the tortoise. My neww has become a bit of a tortoise, in consequence of the smack on the side of the head he got in the meadows on Scott's Hills in the course of last summer. But that's no reason why, if he's pushed judicious—I say judicious, mind you

—he should not at the end of the year be on level terms with them that has greater advantages. If five hour at four mile an hour will enable a b'y to do twenty mile, seven hour at three mile an hour will enable that same b'y to do one-and-twenty mile.'

The schoolmaster made a motion of assent, and Snelling paused.

'I beg your pardon; I thought you was going to make a observation.'

'I simply intended to signify my entire agreement, Mr Snelling.'

'The b'y,' pursued Mr Snelling, 'has took shelter, as a b'y is apt to do, under his father's weakness. The b'y—as most b'ys are—is inclined to take it easy, if he gets the chance. In short, sir, he has grown lazy with indulgence. That is what's mainly the matter with him; he has grown lazy with indulgence. Now, what I wish, sir, is that that theer perclivity should be conquered in him. The last words his father said to me before the coroner's inquest was held upon his body was these: "Robert," he said, "I look to you to do your duty by the b'y. I know," he said, "that it is and will be a arduous task; but," he says, "I look to you to do it. I shall expect you," says he, "to be a second father to him, and I repose full confidence in you."—Now, sir,' continued Mr Snelling, with a bullying air, 'I intend to be worthy of them words, and to do my duty in the spirit as it was confided to me. I desire John to be pushed forrad, and though I shan't ask you to exercise any undoo severity, I shall look for results from this here conversation.'

He was so portentously slow, that Macfarlane, who was glib of speech and warm of temperament, felt inclined to hurry him. 'I grasp your idea, sir,' he said when he was quite sure that his visitor had finished, 'and I will do my best to carry out your instructions. I have had backward boys in my charge before to-day, Mr Snelling, and I think I may say that I have been tolerably successful with them.'

'We shall see, sir,' returned Snelling—'we shall see. You will find him inclined to wander, and you may be took in by that, as I was took in by it, unless you are forewarned. He has been allowed to wander, and that's wheer the mischief has come in. His mind must be kep' upon his task; he must be shown as he will not be allowed to wander.'

'I will bear your instructions in mind, Mr Snelling,' said the schoolmaster. 'I have observed that tendency in John.' He took a retrospective look. 'I have observed that tendency, and but that his father's instructions were emphatically towards leniency—I may say towards indulgence—I think I should have been able to correct it.'

Mr Macfarlane was a survival, and not a very late survival either, of those days when a man who had failed in every other walk of life was still held good enough to be a schoolmaster. There was not a country town in England at that time which did not own one pedagogue to whose care the welfare of a score or two of boys was confided, without his having either special training or special learning or special temper. A brass plate and a prospectus were stock-in-trade enough to start with; and if the

man who displayed these essentials to the world had not the others, they were supposed perhaps to come with practice, or perhaps their presence or absence was not supposed to matter much. Macfarlane wrote a copper-plate hand, spelled accurately, and was dreadfully distinct and anxious about his aspirates, so that he passed with the easy-going Castle-Barfield folk not merely as a scholar but a person of high-breeding. When a man not only breathed hard on 'him' and 'whom' but was actually compelled by his sense of responsibility to the language to wedge a laborious aspirate into 'we-heelbarrow,' it was evident that he was a person of no common training. The homely folks would have felt that 'a anybody but a schoolmaster a care so constant would have something too much of a reproach for common people who had something more than their *hs* to think about; but in a preceptor of youth it was excellent, and gave him just that happy difference from other men which a white tie gave the parson.

Whether the idea were born with him, or inspired into him, or whether it grew merely as a result of habit and custom, and was confirmed by experience, Macfarlane's educational fetich was the bamboo cane. Without bodily suffering, he really did not see how boys were to learn anything. He was quite honest in this belief, as many worthier men than he had been before him; and since he was so, it was well for him, if not for the urchins who lived beneath his rule, that he felt as much pleasure in inflicting punishment as some men do in spreading happiness. The enjoyment of other people's pain is like the habit of dram-drinking or opium-taking—it grows with practice, and nature demands an increasing dose. The schoolmaster had enjoyed twenty years of arbitrary power, and to make some young soul wretched, or some young body to smart and tingle, had grown into a daily necessity with him. To have at the back of his keepest relish a firm and rooted belief that he was doing an imperative duty whilst he enjoyed himself, was delightful.

All that Snelling knew or cared about him was that he was a strict disciplinarian, who, being led to suspect that a boy shammed dullness, would be likely to be hard with him. For his own part, he had said nothing that the most affectionate and dutiful of uncles and guardians might not have said of a child whom he wished well from the bottom of his heart; but turning over the theme in his dull mind, he thought he saw a chance of protecting himself against possible suspicion, and took it, not without some inward tremors.

'You see, sir,' he said to Macfarlane, 'their's a thing that lays a extry anxiety upon my shoulders. This b'y is heir to a very considerable property, and I am his sole guardian. I am his sole relative; and if his education should be neglected, and he should live to grow up as soft as he is now, their's them in Castle-Barfield as is quite low enough in their minds to say as I neglected him with a eye to my own interest. Therefore, I feel it needful to be severe with him, and to push him forrad harder than I should do.'

'I think I may say,' replied Macfarlane, rising, as his visitor rose, and escorting him to the

door, 'that I fully appreciate your anxiety. The boy needs a firm hand.'

'That is what he needs,' said Snelling—'a firm hand.'

'He will find it here, Mr Snelling; he will find it here.—Good-morning, Mr Snelling.'

It happened that John went to school at the opening day of the new year's business there in unusually good spirits, and that he joined in a romp with his schoolfellows with something of his old abandon and jollity. Macfarlane, tying on his black satin stock at a bedroom window which overlooked the playground, observed this, and stored it up for use. It is not doing the good man any injustice to admit that he felt eager to begin the cultivation of his patch of boyhood, or to acknowledge that he resolved that if the bamboo had anything to say to it, John should advance as rapidly as his comrades. The bamboo was not the end, but only the means of culture, a plough which prepared the ground for the reception of the seed of learning. Tickle the boy with bamboo, and he laughed with a harvest of verbs and moods and tenses.

Above the awful desk of state at which he sat, Macfarlane had a board which moved upon a hinge. It bore on one side the word 'Work,' and on the other the word 'Leisure,' each legibly printed in black letters on a white ground. It displayed one side or the other in obedience to the tug of a cord which lay within easy reach of the schoolmaster's hand, and either in rising or falling it struck a circular spring from which a bell was suspended. The bell rang, and dead silence or wild clamour of tongues succeeded.

The boys were already marshalled to their desks when the master entered, and took his customary place amidst a deafening hubbub. The cord was pulled, the bell rang, the board showed the dire legend 'Work,' and the labours of the schoolboy year began.

'You may have heard, boys,' said Mr Macfarlane, who, bereft of authority during the month of holiday, and forced to abdicate from his throne, felt all the happier on coming back again, and was gifted at such times with a dreadful jocularity—'you may have heard, boys, that it is a practice amongst Her Majesty's judges, when they visit a town at which criminals are ordinarily brought before them to be tried, and when, contrary to the general rule, they find that no breach of the laws has been committed, to assume a pair of white gloves. Now, I should very much like at the end of the present session to be able to assume a pair of white gloves myself. I should be proud and pleased if for once in my dealings with you I should find it unnecessary to inflict punishment upon one of your number.—Crowther! stand up, sir! What do you mean, sir, by those hideous contortions?'

'Kenrick's put a pea in my ear, sir, if you please, and I can't get ~~it~~ out, sir.'

'Indeed,' said Mr Macfarlane. 'Thus early in the history of the half-year—even upon its threshold, I find my hopes dashed to the ground.—Kenrick, I will ask you to be good enough to report yourself to me after-morning school-hours. These little ebullitions of holiday feeling must be checked,' Kenrick; they must be checked, Kenrick, and you may rely upon it that they

shall be checked, and sternly. There is always one misdemeanant, who must be the first to suffer in any half-year of work upon which we may enter, and you, Kenrick, have promoted yourself to that bad eminence.'

Being thus early assured of any fear he may have had of getting out of practice, Mr Macfarlane descended from his desk and marched among his forces, and every boy who felt him hovering over his shoulder would have run for shelter, as chickens run from the shadow of a hawk, if he had had any protecting wing to fly to. The laborious tongue which followed the up and down stroke was withdrawn from sight—for it was a playful trick of Mr Macfarlane's to chuck the chins of offenders in this respect—and the pen faltered woefully under that cruel eye. The passing shadow of the master's presence scared the toiler at the rule of three, and shook with polar chills and equatorial burnings the student of geography.

What a blessing it is that the memory of a boy is so short, and the memories of men are so illusive! Men reared under the cruellest training look back to their youthful days with kindness, and remember even their tyrants with no bitterness of heart. It is well for the world at large that this is so; but it is none the better for the tyrants, but rather the worse, for it is well for no man to escape the just punishment of his offences. There are fewer impostors in the noble scholastic realm than used to walk there. There are fewer rages in innocent helpless hearts, and fewer and less bitter tears shed by childish eyes, than in those bad old days, but the tears are remembered somewhere, and the provoked offences of the innocent are not forgotten. And there are still professors enough of the harsh school to make it worth while to ask how much the better they are for the heart-hardening regimen which made their childhood bitter.

Mr Macfarlane was a dutiful man, and had had young John especially recommended to his faithful care. Poor John had forgotten what his elder very well remembered; they had parted with bad blood between them, and only the accident of his being called away from school had saved John from a flogging for that hysterical sacrilegious laugh when Jenvey had given his mad denial to the schoolmaster's pet formula.

In the course of his strollings hither and thither, Macfarlane kept his eye upon his specially recommended pupil. The specially recommended pupil was apparently diligent, and was seated with his head in both hands and his eyes bent upon his book.

'Vale,' said the schoolmaster, coming up with him and laying a hand upon his shoulder, 'your uncle is very little pleased with the progress you have been making, and I have promised to devote particular attention to your studies. Little birds that can sing and will not sing will have to be made to sing. I shall have to see that you keep full pace with your comrades. You have had ample consideration on account of your accident, and you will now begin in earnest. You understand me, sir?'

'Yes, sir,' John answered.

'It will be well for you if you do,' Macfarlane responded, 'for I shall visit severely any tendency I may observe in you to shirk your lessons.'

At this the wheel began to turn in John's head, but he made shift to answer: 'I beg your pardon, sir. I'll try; but I'm afraid I can't learn as fast as the other boys. It makes my head turn, if you please, sir; it's turning now.'

'I have no doubt,' replied Macfarlane, with a relish how much superior to that he would have got out of a retort to a creature of an equal size!— 'I have no doubt we shall make it turn to some purpose before we have done with it.'

It began to turn to some purpose now, and turned so industriously that John sat in a sick whirl until it came to his turn to be examined, by which time his mind was as blank as Sahara, and Mr Macfarlane found it necessary to test the stimulative powers of the bamboo. But weeds of confusion and tares of helplessly rebellious pain were all that grew beneath it, and the end of the first day found the boy sullenly empty.

'The lad's head's a waste,' said Uncle Robert to Isaiah that evening. 'I'm sore afraid he'll never come to be anything but a fool as long as theer's breath in his body.'

He thought in his heart what an able unconscious ally Macfarlane was likely to be, and looked over his cousin John's accounts later in the evening with an enjoying relish.

THE FINDING OF 'CRUSOE'

WHEN Captain Woodes Rogers, in 1708, arranged for his privateering expedition to the South Seas, he doubtless expected to encounter many strange experiences and adventures. He never imagined, however, that one incident in his celebrated voyage would be the origin of what is undoubtedly the most popular and wide-read piece of romantic fiction. It is generally allowed that Alexander Selkirk, the Scottish mariner, was the original of Defoe's immortal castaway; but it is only a few readers—comparatively speaking—who are aware of the real facts concerning the rescue of the lonely colonist. In 1712 Captain Rogers published his *Journal of a Cruising Voyage round the world*, and this has now been reprinted, with notes and illustrations, by Mr Robert C. Leslie, under the title of *Life Aboard a British Privateer in the Reign of Queen Anne* (London: Chapman & Hall).

It was on the 2d of August 1708 that Captain Rogers' expedition left Bristol roads, and it consisted of the *Duke*, burden about 320 tons, having 30 guns and 117 men; and the *Duchess*, burden about 260 tons, 26 guns and 108 men; both well furnished with all necessaries on board for a distant undertaking.

The Cove of Cork was reached on the 7th, and here the ships were subjected to a thorough overhaul preparatory to departing on their lengthened and adventurous enterprise. Here, also, several seamen were shipped in place of some who had come from Bristol, 'who being ordinary fellows and not fit for our employment,' were summarily dismissed. During the stay at Cork, Captain Rogers complains of his men 'continually marrying,' and mentions one instance of a match

between a Dane and an 'Irish woman,' when the services of an interpreter had to be called in. In this case the parting was a sad one, 'the fellow continued melancholy for several days after we were at sea;' while the others parted in the best of spirits on either side.

The ships' companies included several who had already seen service in the same kind of expeditions, notably 'William Dampier, pilot for the South Seas, who had been already three times there, and twice round the world;' and some others of the famous Captain Dampier's crews and officers. The crews numbered in all 333 men, and at the best were a somewhat 'mixed multitude,' as the narrator informs us there were included 'tinkers, taylors, haymakers, peddlers, fiddlers, &c., one negro, and about ten boys. With this mixed gang we hoped to be well manned, as soon as they had learnt the use of arms and got their sea-legs, which we doubted not soon to teach 'em, and bring them to discipline.'

We quote this merely to show the difficulties these old explorers had to contend with, and as an instance of the daring shown in attempting these adventurous and dangerous expeditions. The officers were double the number usually carried, in order to provide for casualties and probable mutinies.

On September 1st, the expedition at last departed in company with some other vessels bound to foreign parts; but on the 6th, Captain Rogers parted company with the rest of the fleet, and set sail for Madeira. Here it was intended to lay in a supply of wines, as 'our men were but meanly clad, yet good liquor to sailors is preferable to clothing!' Difficulties with the motley crews were soon apparent. A mutiny broke out on the 11th because they were not permitted to plunder a Swedish barque they overhauled. This was speedily suppressed, and the ringleaders punished. On the 18th they made their first prize off Grand Canary; this was a small Spanish ship with forty-five passengers on board, including four 'friars.' One of the latter, we are told, was 'a good honest old fellow,' who waxed merry drinking King Charles III.'s health; 'but the rest were of the wrong sort.' Abstemious were evidently not approved of in those days. The wine and brandy on board were confiscated; and on arrival at Orotava, negotiations for the ransom of the barque and prisoners were with some difficulty arranged, and the expedition continued its course.

The equator was crossed a few days later, and the usual dues paid to Neptune by the novices. About sixty of the crew were ducked three times overboard, others preferring to pay a fine of half-a-crown. This ducking 'proved of great use to our fresh-water sailors,' to recover the colour of their skins, which were grown very black and nasty.

We have not space to follow the various fortunes of the expedition, so will hurry on to the more immediate subject of this article.

After touching at St Vincent and one or two other places, the coast of Brazil was reached, and Captain Rogers enters upon a lengthy disquisition on that country and its history. Nothing very important transpired for the next few weeks.

Cape Horn was safely doubled, and on January 15th, 1709, the ships entered the South Sea. Several of the men were now suffering from scurvy, and it was determined to make with all speed for the island of Juan Fernandez. Of its exact position, however, they were unaware, none of their charts agreeing as to its latitude or longitude, and being a small island, they were in great fears they might miss it. Their usual luck did not in this instance desert them, and on January 31st, at seven o'clock in the morning, they made the island, on which they found Alexander Selkirk. We think it best to give the account of Selkirk's rescue in the pithy and quaint language of Captain Woodes Rogers himself:

* *February 1.*—About two yesterday in the afternoon we hoisted our pinnace out; Captain Dover with the boat's crew went in her to go ashore, tho' we could not be less than four leagues off. As soon as the pinnace was gone, I went on board the *Duchess*, who admired our boat attempted going ashore at that distance from land. As soon as it was dark, we saw a light ashore; our boat was then about a league from the island, and bore away for the ships as soon as she saw the lights. We put out lights aboard for the boat, tho' some were of opinion the lights we saw were our boat's lights; but as night came on, it appeared too large for that. We fired our quarter-deck gun and several muskets, showing lights in our mizzen and fore-sarouls, that our boat might find us, whilst we plied in the lee of the island. About two in the morning our boat came on board; we were glad they got well off, because it begun to blow. We were all convinced the light is on the shore, and design to make our ships ready to engage, believing them to be French ships at anchor, and we must either fight 'em or want water, &c.

Febr. 2.—We stood along the south end of the island in order to lay in with the first southerly wind, which Captain Dampier told us generally blows there all day long. The flaws came heavy off the shore, and we were forced to reef our topsails when we opened the middle bay where we expected to find our enemy, but saw all clear, and saw no ships in that nor the other bays. We guessed there had been ships there, but that they were gone on sight of us. We sent our yawl ashore about noon, with Captain Dover, Mr Brye, and six men all armed. Our boat did not return, so we sent our pinnace with the men armed, to see what was the occasion of the yawl's stay; for we were afraid that the Spaniards had a garrison there, and might have seized them. We put out a signal for our boat, and the *Duchess* showed a French ensign. Immediately our pinnace returned from the shore, and brought abundance of crawfish, with a Man clothed in goatskins, who looked wilder than the first owners of them. He had been on the island four years and four months, being left there by Capt. Stradling in the *Cinque-Ports*. His name was Alexander Selkirk, a Scotch man, who had been Master of the *Cinque-Ports*, a ship that came here last with Capt. Dampier, who told me that this was the best man in her; so I immediately agreed with him to be a mate on board our ship. 'Twas, he that made the fire last night when he

saw our ships, which he judged to be English. During his stay here, he saw several ships pass by, but only two came in to anchor. As he went to view 'em, he found 'em to be Spaniards, and retired from 'em; upon which they shot at him. Had they been French, he would have submitted; but chose to risk his dying alone on the island rather than fall into the hands of the Spaniards in these parts, because he apprehended they would murder him, or make a slave of him in the mines, for he feared they would spare no stranger that might be capable of discovering the South Sea. The Spaniards had landed before he knew what they were, and they came so near him that he had much ado to escape; for they not only shot at him, but pursued him into the woods, where he climbed to the top of a tree, where they halted and killed several goats just by, but went off again without discovering him. He told us that he was born at Largo, in the county of Fife, in Scotland, and was bred a sailor from his youth. The reason of his being left here was a difference betwixt him and his captain; which, together with the ships being leaky, made him willing rather to stay here than go along with him at first; and when he was at last willing, the captain would not receive him. He had been in the island before to wood and water, when two of the ship's company were left upon it for six months till the ship returned, being chased thence by two French South Sea ships. [From this it will be seen that Selkirk was not the first involuntary inhabitant of Juan Fernandez.]

He had with him his clothes and bedding, with a firelock, some powder, bullets, and tobacco, a hatchet, a knife, a kettle, a Bible, some practical pieces, and his mathematical instruments and books. He diverted and provided for himself as well as he could; but for the first eight months had much ado to bear up against melancholy, and the terror of being left alone in such a desolate place. He built two huts with pimento trees, covered them with long grass, and lined them with the skins of goats, which he killed with his gun as he wanted, so long as his powder lasted, which was but a pound; and that being near spent, he got fire by rubbing two sticks of pimento wood together upon his knee. In the lesser hut, at some distance from the other, he dressed his victuals, and in the larger he slept and employed himself in reading, singing psalms, and praying; so that he said he was a better Christian while in this solitude than ever he was before, or than, he was afraid, he should ever be again. At first he never ate anything till hunger constrained him, partly for grief, and partly for want of bread and salt; nor did he go to bed till he could watch no longer; the pimento wood, which burnt very clear, served him both for firing and candle, and refreshed him with its pleasant smell.

He might have had fish enough, but could not eat 'em for want of salt, except crawfish, which are there as large as lobsters, and very good. These he sometimes boiled, and at others broiled, as he did his goats' flesh, of which he made very good broth, for they are not so rank as ours. He kept an account of five hundred that he killed while there, and caught as many more, which he marked on the ear and let go. When his powder failed, he took them by speed of foot; for his way of living and continued

exercise of walking and running cleared him of all gross humours, so that he ran with wonderful swiftness thro' the woods and up the rocks and hills, as we perceived when we employed him to catch goats for us. We had a bulldog which we sent with several of our nimblest runners to help him in catching goats; but he distanced and tired both the dog and the men, caught the goats, and brought 'em to us on his back. He told us that his agility in pursuing a goat had once like to have cost him his life; he pursued it with so much eagerness, that he caught hold of it on the brink of a precipice, of which he was not aware, the bushes having hid it from him; so that he fell with the goat down the said precipice a great height, and was so stunned and bruised with the fall that he narrowly escaped with his life; and when he came to his senses, found the goat dead under him. He lay there about twenty-four hours, and was scarce able to crawl to his hut, which was about a mile distant, or to stir abroad again in ten days.

He came at last to relish his meat well enough without salt or bread, and in the season had plenty of good turnips, which had been sowed there by Capt. Dampier's men, and have now overspread some acres of ground. He had enough of good cabbage from the cabbage-trees, and seasoned his meat with the fruit of the pimento trees, which is the same as the Jamaica pepper, and smells deliciously.

He soon wore out all his shoes and clothes by running thro' the woods; and at last being forced to shift without them, his feet became so hard that he run everywhere without annoyance; and it was some time before he could wear shoes after we found him; for not being used to any so long, his feet swelled when he came first to wear them again.

After he had conquered his melancholy, he diverted himself sometimes by cutting his name on the trees, and the time of his being left and continuance there. He was at first much pestered with cats and rats, that had bred in great numbers from some of each species which had got ashore from ships that put in there to wood and water. The rats gnawed his feet and clothes while asleep, which obliged him to cherish the cats with his goats' flesh; by which many of them became so tame that they would lie about him in hundreds, and soon delivered him from the rats. He likewise tamed some kids, and to divert himself would now and then sing and dance with them and his cats; so that by the care of Providence and vigour of his youth, being now about thirty years old, he came at last to conquer all the inconveniences of his solitude and to be very easy. When his clothes wore out, he made himself a coat and cap of goat-skins, which he stitched together with little thongs of the same that he cut with his knife. He had no other needle but a nail; and when his knife was wore to the back, he made others as well as he could of some iron hoops that were left ashore, which he beat thin and ground upon stones. Having some linen cloth by him, he sewed himself shirts with a nail, and stitched 'em with the worsted of his own stockings, which he pulled out on purpose. He had his last shirt on when we found him on the island.

At his first coming on board us, he had so much forgot his language for want of use, that

we could scarce understand him; for he seemed to speak his words by halves. We offered him a dram; but he would not touch it, having drank nothing but water since his being there, and 'twas some time before he could relish our victuals.

Such is the simple but interesting account of the discovery and rescue of Selkirk; and it was no doubt the reading of this which first inspired Defoe to plan his most famous literary conception, *Robinson Crusoe*.

Besides the two sailors mentioned previously as living alone on Juan Fernandez, there are others mentioned by other writers. Ringrose, in his account of the voyage of Captain Sharp, the buccancer, mentions one man who was the only survivor of a wreck and who lived here quite alone, for five years. Captain Dampier also tells of a Mosquito Indian left here by mistake, and remaining for three years, till rescued by Dampier in 1684. In Selkirk's case his exile was not without its advantages, for the ship he left was shortly afterwards lost and only a few of the crew escaped.

After Selkirk got over the melancholy feelings engendered by his loneliness at first, he seems to have become tolerably reconciled to his solitary condition; and as Captain Woodes Rogers quaintly observes: 'We may perceive by this story the truth of the maxim, that Necessity is the mother of Invention, since he found means to supply his wants in a very natural manner, so as to maintain his life, tho' not so conveniently, yet as effectually as we are able to do with the help of all our arts and society. It may likewise instruct us how much a plain and temperate way of living conduces to the health of the body and the vigour of the mind, both which we are apt to destroy by excess and plenty, especially of strong liquor, and the variety as well as the nature of our meat and drink for this man, when he came to our ordinary method of diet and life, tho' he was sober enough, lost much of his strength and agility.'

With which highly sensible moral disquisition we will take leave of our gallant author and privateersman and the rescued 'Crusoe.'

THE LOST DIAMONDS OF THE ORANGE RIVER.

II.

TAKING some dried flesh, biscuits, and a bottle of water each, and each shouldering a rifle, Klaus and I started away at seven o'clock. The little beggar, who, I suppose, in his Bushman youth had wandered baboon-like over all this wild country till he knew it by heart, showed no sign of hesitation, but walked rapidly down hill to a deep gorge at the foot, that led half a mile or so into a huge mass of mountain that formed the north wall of the Orange River. This kloof must at some time or another have served as a conduit for mighty floods of water, for its bottom was everywhere strewn with boulders of titanic size and shape, torn from the cliffs walls above. It took us a long hour of the most laborious effort to surmount these impediments; and then, with torn hands and aching

legs, we went straight up a mountain whose roof-like sides consisted of masses of loose shale and shingle, over which we slipped and floundered slowly and with difficulty. I say we; but I am bound to admit that the Bushman made much lighter of his task than I, his ape-like form seeming, indeed, much more fitted for such a slippery break-neck pastime.

At length we reached the crest; and then, after passing through a fringe of bush and scrub, we scrambled down the thither descent, a descent of no little danger. The slipping shales that gave way at every step, often threatened, indeed, to hurl us headlong to the bottom. At last this stage was ended, and we found ourselves in a very valley of desolation. We were almost completely entombed by narrowing mountain walls, whose dark-red sides frowned upon us everywhere in horrid and overpowering silence. The sun was up, and the heat, shut in as we were, overpowering. Moreover, to make things more lively, I noticed that snakes were more than ordinarily plentiful, the bloated puff-adder, the yellow cobra, and the dangerous little night-adder, several times only just getting out of our path.

The awful silence of this sepulchral place was presently, as we rested for ten minutes, broken by a company of baboons, which, having espied us from their krantzes above, came shoggling down to see what we were. They were huge brutes and savage, and *quoth-quoth* at us threateningly, till Klaas sent a bullet among them, when they retreated pell-mell. We soon started again, and pressed rapidly along a narrow gorge some fifty feet wide, with perfectly level precipitous walls, apparently worn smooth at their bases by the action of terrific torrents, probably an early development of the Orange River when first it made its way through these grim defiles. Presently the causeway narrowed still more; and then turning a sharp corner, we suddenly came upon a pair of leopards sauntering coolly towards us. I didn't like the look of things at all, for a leopard at the best of times is an ugly customer, even where he knows and dreads firearms. The brutes showed no intention of bolting, but stood with their hackles up, their tails waving ominously, and their gleaming teeth bared in fierce defiance. There was nothing for it—either we or they must retreat; and having come all this frightful *trek* for the diamonds, I felt in no mood to back down even to *Felis pardus* in his very nastiest nook. Looking to our rifles, we moved very quietly forward until within thirty-five yards of the grim cats. They were male and female, and two as magnificent specimens of their kind as sun ever shone upon. The male had now crouched flat for his charge, and not an instant was to be lost. The female stood apparently irresolute. Noticing this, and not having time to speak, we both let drive at the charging male. Both shots struck, but neither stopped him. The lady, hearing the report, and apparently not liking the look of affairs, *continently* fled. With a horrid throaty grunt, the male leopard flew across the sand, coming straight at me, and then launched himself into air. I fired too hurriedly my second barrel, and, for a wonder, clean missed, for in those days I seldom failed in stopping dangerous game; but these beggars are like lightning once they are charging. In a moment,

as the yellow form was flying through space straight at my head, I sprang to one side, and Klaas firing again, sent the leopard struggling to earth, battling frantically for life amid sand and shingle with a broken back. Lucky was the shot, and bravely fired, or I had probably been as good as dead. Klaas soon whipped the skin off the dead leopard and hid it under some stones; and we then proceeded, the whole affair having occupied but twenty minutes.

Another mile of this canal-like kloof brought us to a broad opening where the wall of mountain on our left stood up straight before the hot sunlight, a dark reddish-brown mass of rock, I suppose some five hundred feet in height, and then sloped away more smoothly to its summit, that overlooked the river, as I should judge, about a mile distant. As we came out into the sunshine, Klaas, pointing to the cliff, ejaculated in quite an excited way: 'The Pearl! the Pearl! Look sir, look.' Looking upwards at the mass of rock, my eye was suddenly arrested by a gleaming mass that protruded from the dead wall of mountain. Half dazzled, I shaded my eyes with my hand and looked again. It was a most strange and beautiful thing that I beheld, a freak of nature the most curious that I had ever set eyes on. The glittering mass was a huge egg-shaped ball of quartz of a semi-transparent milky hue, flashing and gleaming in the radiant sunshine with the glorious prismatic colours that flash from the unlucky opal. But yet more strange, above 'de Paarl,' as Klaas quaintly called it, and overhanging it, was a kind of canopy of stalactite of the same brilliant opalescent colours. It was wonderful! Klaas here began to caper and dance in the most fantastic fashion, and then suddenly ceasing, he said: 'Now, *sieur*, I will soon show you the diamonds—they are there,' pointing to a dark corner of the glen, 'right through the rock.'

'What made you call that shining stone up there "de Paarl?"' said I, as I gazed in admiration at the beautiful ball of crystal.

'Well, *sieur*, I was once with a wine Boer at the Paarl down in the old Colony, and a man told me why they called the mountain there "de Paarl;" and he told me, too, what the pretty gems were that I saw in the young *wrouw's* best ring when she wore it; and I then knew what a pearl was, and that it came from a fish that grows in the sea. And I remembered then the great shining stone that I found up here when I was a boy on the Groot Rivier, and I thought to myself: "Ah, Klaas, that was the finest pearl ye ever saw, that up in the cliff near where the pretty white stones lay." I mean the diamonds yonder, *sieur*.'

At last, then, we were within grasp of the famous stones concerning whose reality I had even to the last had secret misgivings. It was a startling thought. Just beyond there, somewhere through the rock-walls, whose secret approach at present Klaas only knew, lay 'Sindbad's Valley.' Could it be true? Could I actually be within touch of riches unspeakable, riches in comparison with which the wealth of Croesus seemed but a beggar's hoard?

I sat down on a rock and lit a pipe, just to think it over and settle my rather highly strung nerves. The Paarl, as I could now see, was

a unique formation of crystal-spar, singularly rounded upon its face. It and the glorious canopy of hanging stalactite above it must have been reft bare by some mighty convulsion that had anciently torn asunder these mountains, leaving the ravine in which we stood.

As we drank from our water-bottles and ate some of the dried flesh and biscuits we had brought with us, I noticed Klaas's keen little eyes wandering inquiringly round the base of the precipice in our front. He seemed puzzled; and as we finished our repast and lit our pipes again, he said: 'The hole in the rock that leads from this kloof to the diamonds should be over there'—pointing before him; 'but I can't quite make out the spot, the bushes have altered and grown so since I was here as a boy years and years ago.'

We got up and walked straight for the point he had indicated, and reached the foot of the precipice. The Bushman hunted higher and thither in the prickly jungle with the fierce rapidity of a tiger-cat; but, inasmuch as he was sometimes prevented from immediately approaching the rock-wall, he appeared unable to hit off the tunnel that led, as he had formerly told me, to the valley beyond. Suddenly, after he had again disappeared, he gave a low whistle; a signal to approach, to which I quickly responded. Quietly pushing my way towards him, I was astonished to see within a small clearing a thick and high thorn-fence, outside of which Klaas stood. Inside this circular kraal was a low round hut, formed of boughs and branches strongly and closely interlaced. Klaas was standing watching intently the interior of the hut, which seemed to be barred at its tiny entrance by a pile of thorns lying close against it.

What could it mean, this strange dwelling, inaccessible as it seemed to human life? Klaas soon found a weak spot in the kraal fence, and pulling down some thorns, we stepped inside and approached the hut. Here, too, Klaas pulled away the dry mimosa-thorns from the entrance, and was at once confronted by a tiny bow and arrow, and behind that by a fierce little weakened face. Instantly, my Bushman poured forth a torrent of his own language, redundant beyond expression with those extraordinary clicks of which the Bushman tongue seems mainly to consist. Even as he spoke, the bow and arrow were lowered, the little head appeared through the entrance, and the tiniest, quaintest, most ancient figure of a man I had ever beheld stood before us. Ancient, did I say? Ancient is hardly a meet description of his aspect. As he stood there blinking like an owl in the fierce sunlight, his only covering a little skin *kaross* of the red rhe-bok fastened over his shoulders, he looked indeed coeval with the rocks around him. I never saw anything like it. Poor little oddity, dim though his eyes were waxing, feeble though his shrivelled arm, dulled though his formerly acute senses, he had, with all the desperate pluck of his race, been prepared to do battle for his hearth and home!

In his own tongue, Klaas interrogated this antediluvian Bushman, and then suddenly, as he was answered by the word 'Ariscep, a light flashed across his countenance. Seizing his aged countryman by the shoulders, he turned him round and carefully examined his back. Lifting the skin

kaross and rubbing away the coating of grease and dirt that covered the right shoulder, Klaas pointed to two round white scars just below the blade-bone, several inches apart. Then he gave a leap into the air, seized the old fossil by the neck, and shrieked into his ears the most wonderful torrent of Bushman language I have ever heard. In his turn the old man started back, examined Klaas intently from head to foot, and in a thin pipe jabbered at him almost as volubly.

Finally, Klaas enlightened me as to this comical interlude. It seemed incredible; but this old man, 'Ariscep by name, was his grandfather, whom he had not set eyes on since long years before the Boer *commando* had broken into his tribal fastness, slain his father and mother and other relatives, and carried himself off captive. The old man before us had somehow escaped in the fight, had crept away; and after years of solitary hiding in the mountains around, had somehow penetrated to this grim and desolate valley, where he had subsisted on Bushman fare—snakes, lizards, roots, gum, bulbs, fruit, and an occasional snared buck or rock-rabbit; these and a little rill of water that gushed from the mountain side hard by supplied him with existence. Here he had lingered for many years, alone and isolated.

After nearly an hour's incessant chatter, during which I believe Klaas had laid before his monkey-like ancestor an epitomised history of his life, he told the old man we wished to get through the mountain, and that he had lost the tunnel of which he had known as a boy. 'Ariscep, who, it seems, in the years he had been there had explored every nook and cranny of the valley, knew at once what he meant, and quickly pointed out to us, not one hundred paces away, a dense and prickly mass of cactus and euphorbia bush. Here, after half an hour's hewing and slashing with our hunting knives, we managed to open a pathway; and at last a cave-like opening in the mountain, about seven feet in diameter, lay before us. The old man, however, gave us warning that snakes abounded, and might not impossibly be encountered in the twenty minutes' crawl which, as Klaas had told us, it would take to get through. This opinion was not of a nature to fortify me in the undertaking, yet, rather than leave the diamonds unexplored, I felt prepared to brave the terrors of this uncanny passage.

It was now three o'clock; the sun was marching steadily across the brassy firmament on his eastward trek, and we had no time to lose.

'In you go, Klaas,' said I; and, nothing loth, Klaas dived into the bowels of the mountains, I at his heels. For five minutes, by dint of stooping and an occasional hands-and-knees creep upon the flooring of the tunnel, sometimes on smooth sand, sometimes over protruding rock and rough gravel, we got along very comfortably. Then the roof of the dark avenue—for it was pitch dark now—suddenly lowered, and we had to crawl along. It was unpleasant, I can tell you, boxed up like this beneath the heart of the mountain. The very thought seemed to make the oppression a million times more oppressive. Even Klaas, plucky Bushman though he was, didn't seem to relish the adventure, and spoke in a subdued and awe-stricken whisper. Sometimes since, as I have thought of that most gruesome passage, I have burst into a sweat nearly as profuse, though not

so painful as I endured that day. At last, after what seemed to me hours and hours of this painful crawling and Egyptian gloom, we met a breath of fresher air; the tunnel widened and heightened, and in another five minutes we emerged into the blessed sunlight. Little Klaas looked pretty well 'baked,' even in his old leather *crackers* (leather trousers) and flannel shirt. As for myself, I was literally streaming; every thread on me was as wet as if I had plunged into a river. We lay panting for a while upon the scorching rocks, and then sat up and looked about us.

If the Paarl Kloof, as Klaas called it, whence we had just come had been sufficiently striking, the mighty amphitheatre in which we lay was infinitely more amazing. Imagine a vast arena almost completely circular in shape, flat and smooth, and composed, as to its flooring, of intermingled sand and gravel reddish yellow in colour. This arena was surrounded by stupendous walls of the same ruddy-brown rock we had noticed in Paarl Kloof, which here towered to a height of close on a thousand feet. In the centre of the red cliffs, blazing forth in splendour, ran a broad band of the most glorious opalescent rock-crystal, which flashed out its rays of coloured light as if to meet the fiery kisses of the sun. This flaming grille of crystal, more beautiful a thousand times than the most gorgeous opal, the sheen of a fresh-caught mackerel, or the most radiant mother-of-pearl, I can only compare in splendour to the flashing rainbows formed over the foaming falls of the Zambesi, which I have seen more than once. It ran horizontally and very evenly round at least two-thirds of the cliff-belt that encircled us. It was a wonderful, an amazing spectacle, and I think quite the most singular of the many strange things (and they are not few) I have seen in the African interior.

Well, we sat gazing at this crystal rainbow for many minutes, till I had somewhat feasted my enraptured gaze. Then we got up, and at once began the search for diamonds. Directly I saw the gravel, especially where it had been cleansed in the shallow channels by the action of rain and flood, I knew at once we should find 'stones.' It resembled almost exactly the gravel found in the Vaal River diggings, and was here and there strongly ferruginous and mingled with red sand, and occasionally lime. I noticed quickly that agates, jaspers, and chalcedony were distributed pretty thickly, and that occasionally the curious *bad-doom* stone, so often found in the Vaal River with diamonds, and indeed often considered by diggers as a sure indicator of 'stones,' was to be met with. In many places the pebbles were washed perfectly clean, and lay thickly piled in hollow water-ways. Here we speedily found a rich harvest of the precious gems. In a feverish search of an hour and a half, Klaas and I picked up thirty-three fine stones, ranging in size from a small pigeon's egg to a third of the size of my little finger-nail. They were all fine diamonds, some few, it is true, yellow or straw coloured, others of purest water, as I afterwards learned; and we had no difficulty in finding them, although we wandered over not a twentieth part of the valley. I could see at once from this off-hand search that enormous riches lay spread here upon the surface of the earth; beneath, probably was contained fabulous wealth. I was puzzled at

the time, and I have never had inclination or opportunity to solve the mystery since, to account for the presence of diamonds in such profusion. Whether they were swept into the valley by early floodings of the Orange River through some aperture that existed formerly, but had been closed by volcanic action; or whether, as I am inclined to think, the whole amphitheatre is a vast upheaval from subterranean fires of a bygone period, is to this hour an unfathomed secret. I rather incline to the latter theory, and believe that, like the Kimberley 'pipe,' as diggers call it, the diamondiferous earth had been shot upwards funnel-wise from below, and that ages of floods and rain-washing had cleansed and left bare the gravel and stones I had seen upon the surface.

From the search we had had, I made no doubt that a fortnight's careful hunting in this valley would make me a millionaire, or something very like it. At length I was satisfied; and as the eastering sun was fast stooping to his couch, with a light heart and elastic step I turned with Klaas to depart. The excitement of the 'find' had quite banished the remembrance of that awful tunnel-passage so recently encountered.

'We'll go back now, Klaas,' said I, 'sleep in your grandfather's kraal, and get to the wagon first thing in the morning.'

At half-past five we again entered the tunnel. It was a nasty business, when one thought of it again, but it would soon be over. As before, Klaas went first, and for half the distance all went well. Suddenly, as we came to a sandy part of the tunnel, there was a scuffle in front, a fierce exclamation in Bushman language, and then Klaas called out in a hoarse voice: 'A snake has bitten me!' What a situation! Cooped up in this frightful burrow, face to face with probably a deadly snake, which had already bitten my companion. Almost immediately, Klaas's voice came back to me in a hoarse guttural whisper: 'I have him by the neck, *sieur*; it is a puff-adder, and his teeth are sticking into my shoulder. If you will creep up and lay hold of his tail, which is on your side of me, we can settle him; but I can't get his teeth out without your help.'

Crawling forwards, and feeling my way with fright-numbed fingers, I touched Klaas's leg; then softly moving my left hand, I was suddenly smitten by a horrible writhing tail. I seized it with both hands, and finally gripped the horrid reptile, which I felt to be swollen with rage, as is the brute's habit, in an iron grasp with both hands. Then I felt, in the black darkness, that Klaas took a fresh grip of the loathsome creature's neck, and, with an effort, disengaged the deadly fangs from his shoulder. Immediately, I felt him draw his knife, and, after a struggle, sever the serpent's head from its body. The head he pushed away to the right as far out of our course as possible; and then I dragged the writhing body from him, and shuddering, cast it behind me as far as possible.

At that moment I thought that for the first time in my life I must have swooned. But quickly I bethought me of poor faithful Klaas, sore stricken; and I called to him in as cheerful a voice as I could muster: 'Get forward, Klaas, for your life as hard as you can, and, please God, we'll pull you through.' Never had I admired the Bushman's fierce courage more than now.

Most men would have sunk upon the sand and given up life and hope. Not so this aboriginal. 'Ja, sieur; I will loup,' was all he said.

Then we scrambled onward, occasionally halting as the deadly sickness overtook Klaas. At last the light came, and as my poor Bushman grew feebler and more slow, I found room to pass him, and so dragged him behind me to the opening. Here I propped him for a moment on the sand outside with his back to the mountain, and loudly called 'Ariseep!' while I got breath for a moment.

The sun was sinking in blood-red splendour behind the mountains, and the kloof and rock-walls were literally aglow with the parting blush of day. Nature looked calm and serenely beautiful, and hushed in a splendour that ill accorded with the agitating scene there at the mouth of the tunnel. All this flashed across me as I called for the old man. Klaas was now breathing heavily, and getting dull and stupefied. I took him in my arms and carried him to 'Ariseep's kraal, whence the old man was just emerging. At sight of his grandfather, Klaas rallied, and rapidly told him what had happened; and the old man at once plunged into his hut for something. Then Klaas's eyelids drooped, and he became drowsy and almost senseless. In vain I roused him, and tried to make him walk, and so stay the baleful effects of the poison, now running riot in his blood. He was too far gone. 'Ariseep now reappeared with a small skin-bag, out of which he took some dirty-looking powder. With an old knife he scored the skin and flesh around Klaas's wound, and then rubbed in the powder. I had no brandy or ammonia to administer, and therefore let the old Bushman pursue his remedy, though I felt somehow it would be useless. So it proved; either the antidote, with which I believe Bushmen often do effect wonderful cures, was stale and inefficacious, or the poison had got too strong a hold. My poor Klaas never became conscious again, though I fancied eagerly that he recognised me before he died, for his lips moved as he turned to me once. At last, within an hour and a half from the time he was bitten, he lay dead.

So perished my faithful and devoted henchman, the stoutest, truest, bravest soul that ever African sun shone upon. We placed him gently in a deep sandy hollow, and over the sand piled heavy stones to keep the vermin from him. Then laying myself within 'Ariseep's kraal, I waited for the slothful dawn. As it came, I rose, called 'Ariseep' from his hut, and bade farewell to him as best I could, for we neither of us understood one another. I noticed, by-the-by, that no sign of grief seemed to trouble the old man. Probably he was too aged, and had seen too much of death to think much about the matter.

The rest of my story is soon finished. I made my way back to camp, told my men what had happened, and, indeed, took some of them back with me to Klaas's grave, and made them exhume his body, to satisfy themselves of the cause of death; for these men are sometimes very suspicious. Then we covered him again securely against wandering beasts and birds.

I trekked back to the old Colony, sold off my things, and went home. The diamonds I had brought away realised in England twenty-two thousand pounds. I have never dreamt of going

to the fatal valley again. Nothing on earth would tempt me, after that ill-starred journey, heavy with the fate of Klaas and the Bechuana boy Amazi. As for the tunnel, I would not venture once more into its recesses for all the diamonds in Africa, even if they lay piled in heaps at the other end of it. Part of the twenty-two thousand pounds I invested for some relatives; the balance that I kept, sufficed, with what I already possessed, for all possible wants of my own. Then I came back to my dearly loved South Africa for the last time; and a few years later made the journey to the Chobe River, from which you rescued me in the thirst-land.'

Such was the story related to us by the transport rider. Our narrator wound up by telling us that Mowbray had further imparted to him the exact locality of the diamond valley; but he added: 'I have never yet been there, nor do I think that for the present it is likely I shall. Some day, before I leave the Cape, I may have a try, and trek down the Orange River; but I don't feel very keen about that secret passage, after poor Mowbray's experiences.'

A BORROWED ART.

THE grandest of our modern pageants, the Queen's triumphal procession to Westminster in the summer of Jubilee year, is already regarded very generally as mere matter of history; but those fortunate ones who can recall the event as a personal reminiscence will readily allow that among the minor attractions of the princely following, perhaps none exceeded in interest the group of native Indian princes. Calmly and impressively they moved onwards, their gorgeous Eastern attire, richly coloured and sparkling with jewels, contrasting sharply with the manly martial dress of Europe's royal sons. Yet was there to the thoughtful something impressive in the very fidelity of those native princes to the traditions of their forefathers. It is well that in life's seething, rushing current there should be here and there still stretches of back-water, where the tides and the winds scarce have power 'to make or break or work their will.' Such, to the feverish progress of the West, is Eastern conservatism. There, what has been, is; and looking at the dazzlingly arrayed figures of June 1887, one's thought easily pictured Herod Agrippa as for the last time, long, long ago, he stood forth in the sight of his people clothed in a silver robe 'of a texture,' as Josephus tells us, 'truly wonderful.'

But to return to our subject. Perhaps the owners of those cunningly woven, gorgeously embroidered state robes would have been more than a little surprised had they known that here, in the far-off western island, there existed almost within hail a factory devoted entirely to the manufacture of a thoroughly Hindu speciality—gold and silver thread. Within six miles of London Bridge it lies, a quaint, old-world, brick and timber building, with high walls and a calm broad belt of water to shut off the busy city

world, and a rushing stream to drown the din and turmoil of the 'madding crowd.'

Perhaps some of our readers may be interested to learn how silver bars can be transformed into gold thread. In the first place, the silver is brought from the Bank of England in cakes, weighing about one thousand ounces. To secure the necessary degree of tenacity, a certain proportion of copper is added, and the alloyed metal, in the form of cylindrical bars, is next thoroughly heated. The hammering process follows; and the bars—originally about two feet in length and two inches in diameter, but now half as long again, and proportionately thinner—are in the next place filed and rubbed until their surfaces are perfectly even. What we may call the second part of the process begins with the laying on of leaf after leaf of gold in the proportion of two per cent. Afterwards, each bar is wrapped in paper and well heated in a charcoal fire. A sort of vice stands ready; and in it, bar after bar as it comes from the fire is fixed and thoroughly burnished. All trace of its silver original has now disappeared, and the bar is ready for conversion into wire. This is accomplished by drawing it from one hundred to one hundred and fifty times through ever-diminishing holes in steel plates; and finally, when the capabilities of this metal have been exhausted, through apertures in diamonds, rubies, or sapphires. The delicate wire thus obtained must now be passed through the steel rollers of one of Herr Krupp's little 'flattening-mills.' This brings us to the final process—the spinning of the flattened wire round silk, to form the golden thread of commerce. These spinning-machines are worked by water, although two steam-engines are to be found in the factory; for water-power is considered to be more regular and even in its action. There is a small home demand for the round wire for the adornment of epaulets, &c.; but the bulk of the manufactured article finds its way in the shape of silky gold thread to India and the far East generally, where it is converted by skilled native labour into those gorgeous cloths and tissues in which the heart of the Oriental delights.

Have we not here a striking illustration of the superiority of Western thought and enterprise over that of the soft luxurious East? By the aid of machinery and improved methods of working, we are enabled to compete with our Hindu fellow-subjects in one of their specialities despite the difficulties of transit, to say nothing of the expense of transporting goods so great a distance. However surprising the fact, we cease to wonder at it, after being assured that the Hindu with his manual process can only extract eight hundred yards of wire from a piece of silver the size of a florin, which would yield our manufacturers sixteen hundred yards.

What a wonderful property does gold possess in its malleability! It is asserted that every ounce of the bars whose fortunes we have followed with no little interest, each containing only two per cent. of gold, will run to the length of from five hundred to two thousand five hundred yards; and the amazing figure of five thousand yards is on record. This latter thread would be finer than human hair; but the extreme limit is not even yet reached.

There is a tradition telling how an attempt was

once made to produce a wire fine enough for use in a transit instrument. A solid gold wire was drawn by means of a copper cylinder to the length of twenty thousand feet to the ounce; but at that point the shadow of a thread fell to pieces, and the astronomer was obliged to resort to his usual spider's web.

One word as to the history of this unique manufacture. It boasts great antiquity, for the ancient Jewish records make mention of 'apparel of wrought gold,' which was probably identical with the *soneri* or golden stuff of the Hindus. The East was its early and for a long time its only nursery. At length the art found its way to the Continent; and in 1753 a London journal commented on the long-established superiority of the brocade made with the help of gold wire in France. Our neighbours across the Channel kept the secret so well of preparing perforated plates, that for many years we were unable to enter into successful competition with them. British pluck and enterprise, however, succeeded finally in surmounting the difficulty. Plates of the regulation 'mixt metal' were obtained, despite the penalty of capital punishment attached to their exportation, and the peculiar composition of them was studied and copied, until England was enabled to add to her long list of manufactures that of gold wire-drawing, which, besides its utility and interesting process, is worthy of note as one of the few remaining commercial links between the busy world of to-day and the dim ages of antiquity.

THE MAN WHO SWALLOWED THE EAST WIND.

THE well-known story of the two boys who, under the cognomen of 'Eyes and No Eyes,' went out for a walk, in which the one saw nothing worthy of record, while the other saw a great deal both to amuse and interest him, is a good deal older than *Sandford and Merton*, where most of us read it in the old days of long ago. No doubt, 'it is,' as we say, 'as old as the hills'—though, wise men have not yet quite settled how old *they* are—and as true as such proverbs usually are. For, as a general rule, the eye sees only what it wishes to see or cares to see; and there are 'none so blind as those who won't see,' and then, perversely enough, try to comfort themselves with another old saying, 'What the eye sees not, the heart doesn't crave.'

I had been reading an odd volume of Danish proverbs about Eyes and No Eyes, as it chanced, one day in October, just before setting out for a ramble through the woods; and as I wandered on down one of the grassy roads, I suddenly came upon a couple of squirrels at play—a downright game of frisking romp. The carpet under my feet was soft and thick—

Golden and red, purple and brown,
Lightly the woodland leaves came down,
Fluttering here and whirling there
All in the hazy ambient air;

so that not a footfall could be heard, and I could watch the two little merry sprites by simply getting under the boughs of a great copper beech and standing still, without a chance of detection. And so there I stood for some minutes; and such a game of fun I never before saw. The

two imps were like kittens gone mad; they ran races after each other, up one side of a tree and down another; they grinned, they chattered; they took flying leaps from bough to bough; they came down headlong on the piles of leaves with a dash and a hurry and a scramble that sent the small birds flying in all directions. Then they would perch gravely opposite to each other on the green grass, as if on the watch as to which should be the first to begin again their happy frolic. But all at once, as I made up my mind that I was still unseen, a fir-cone fell headlong down from a tall tree, and in a trice they had utterly vanished.

It was a day of dead sultry calm; and as I watched and listened, there fell on me an air of intense stillness and silence that seemed to fill all the wood. Right and left of me, on every side, were dense masses of trees—tall feathery silver birch; broad spreading beeches, with smooth, solemn, massive trunks; sturdy knotted yews, looking as if they had stood there for centuries; strong mighty oaks, with gnarled and twisted stems that stretched across the winding pathway, as if on guard over the quiet domain. Some of them I knew well; for I had seen them in all weathers; and again and again found shelter from rain or sun under their spreading boughs. They seemed like old friends, who betray no trust; even in winter staunch and true, as if standing and waiting in patience and in hope for the far-off but sure days of spring, the time of new life and light; living and dying without suffering or self-reproach; and ‘gifted with the divine gift of silence,’ which, according to a modern sage, is the most eloquent of all speech, for those who can hear it, when ‘The Book of Nature getteth short of leaves.’

But however ‘golden’ such silence may be, and however divine the prophet of Cheyne Row, this one of woodland voices was, like all other mortal dreams, brought suddenly to an end. All at once, not a hundred yards away, there came pounding along over the dead leaves a little old man in a long gray coat; with his hat pulled down over his eyes, and a stout ash-plant in his hand, with which he slashed vigorously right and left among the briars and nettles. It was old Elzie Bartle, a strange odd creature, who lived in a lonely cottage at the end of the village, and spent most of his time in minding other people’s business. Business of his own he seemed to have none; and the neighbours knew no more as to who or what he was than they did when he came among them, a stranger, twenty years ago. He had money enough to pay his way and keep out of debt; was without encumbrances of any kind, and seemed to have neither relatives nor friends that ever cared to write to or visit him. Jacob the postman affirms to this day that no letter ever came to him by post but a circular from the surveyor of taxes at the county town. The moment I set eyes on him in the wood, I went back to my book of Danish proverbs, and to one particular line therein which said, ‘Some there are who see ill, and wouldn’t mind seeing worse;’ and there before me was the very man whom the words fitted to a T.

‘Well, Squire,’ said the old man, as he came up, ‘here’s a day for October! A regular, sweltering, mouldy sort of day, I call it; enough

to breed a fever all over the place. No wonder there’s two more cases of measles down at the keeper’s; not the two boys that got bitten by the sheep-dog last week, but girls this time; a poor sickly lot! and no wonder, with such a mother.’

‘Such a mother?’ said I. ‘Why, what’s the matter with the mother?—as clean, tidy, hard-working a woman as you’ll find in a day’s march.’

‘Nonsense, Squire—non-sense! They sell gin, now, up at Murrledge’s the draper, and if Mrs Gaiters isn’t one of his best customers, my name isn’t Bartle. No, no; I know what I know, Squire, though I don’t want it to go any further.’

‘You had better not let it get as far as her husband’s ears, Elzie, or he might tumble you into the horse-pond and not help you out again. It’s deep, Bartle, and muddy too.’

‘No doubt, Squire, no doubt; but, as I was saying when you interrupted me, I know what I know, though you needn’t let it go any further. Mrs Gaiters is a good customer at Murrledge’s; and it was only yesterday I saw her coming out of his shop with a round bundle under her arm that looked as much like a bottle as it could, as I said to Jane Ripper, when I saw her going down the street.—And that reminds me, Squire, of the nasty drain at the corner. They’ve got it open again, and I’ve not met with a worse stench for weeks until just now, before I saw you, I came upon a polecat or a weasel or something of the sort, lying dead in the middle of the path, and enough to poison the whole wood.’

‘Well, Elzie,’ said I, ‘they must open the drain to clear it out; and as for the polecat, he must die somewhere; and as he has got no relations to bury him, he must lie there until the ants pick his bones clean for him.—But never mind the drains or polecats this glorious afternoon. Come here, man, and look down that narrow green path, right on past the great clump of white clematis, up to where the sunshine is streaming through the black evergreen oak, and lighting up the copper beech, and the cluster of red berries on the spindle-tree, as if they were on fire.’

‘Yes, yes,’ replied the old man; ‘I see it.—And talking of fire, it was just at this very corner that I caught two of Harris’s boys, yesterday, making a fire of bits of furze and a broken hurdle, enough to set the whole copse in a blaze. ‘‘Here; you can see the ashes of it now; and there’s a page out of a spelling-book, too, as I live—torn out of one of the school-books, I’ll wager—the mischievous young wretches!—But it’s all the same wherever you go; nothing but waste and extravagance. All the labourers crying out about low wages and starvation times; and if you believe me, when I went in to Hobbs’s cottage last Thursday at five o’clock, just to tell him that one of his boys had been caught with his pockets full in Jackson’s orchard, there they were, the whole seven of ‘em, eating hot buttered toast!—“You seem to be enjoying yourselves,” said I, “and butter at one-and-three!”—And if you believe me, Squire, they all burst out laughing at this; and “Right you are, Bartle,” says old Hobbs, with his mouth full of toast—“right you are; and why shouldn’t we?—Will ‘ee have a piece?”—“No,” said I, “I can’t afford to eat melted butter in those times; and

if your boy isn't laid up to-morrow, after gorging himself with sour apples, let me know."—"Well, Bartle, we'll be sure to let you know; and we'll tell old Bolus to send in his bill to you."—"There, Squire; that's the way they waste their money; and if that boy doesn't get a month on the treadmill before long, my name isn't Bartle, that's all."

By this time we had got to the edge of the wood and were turning down into the lane; and as I had had more than enough of the old grumbler, I made up my mind to get rid of him. "Good-night, Bartle," said I—"good-night.—For God's sake, don't bother yourself any more about old Hobbs and his boys. He is a hard-working, steady fellow enough, and good to his wife too. And as for the apples, the boy only got a couple after all—so Jackson told me—and a good rope's ending into the bargain."

And so, at last, after a final grumble about Hobbs's mother-in-law and a pair of shoes which she had got at Murrledge's and never paid for, we shook hands and parted; he across the meadow down to his own cottage, and I sauntering on into the village. And here I fell in with another of our old men, of a totally different look, manner, and speech—Jim Samson the blacksmith; a sturdy well-built fellow of sixty, with a sun-burnt smutty face, and a pair of sharp gray eyes that brimmed over with fun. His day's work was over; he had shut up his forge, and was just going home to tea.

"Sarvant, sir," says Samson. "Hope you're pretty well, sir, after a dose of Elzie? I see you a-coming down the copse together, and I says to myself: "Squire's a-catchin' of it now, and no mistake." Old Bartle's bin on the rampage all the mornin', and ready to bust about that there drain up street."

"Well, Samson," said I, "I've had a dose this time, and a good one too."

"Knowed you had, Squire, the minute I saw your face. Why, bliss'ee, flesh and blood can't stand it. It's my belief, Squire, that there old chap "have a-swallowed the East wind," and it haven't agreed with un. He've a-got the best eye for dirt of any chap I ever set eyes on."

"Swallowed the East wind?" said I. "Why so, Samson?"

"Why, how else could he go on as he do? From mornin' to night, from one week's end to another, it's nothing but grumble, fidget, and growl. First, it's the dreadful accidents, the fires, and the murders; then it's the fever and the riots in Ireland; the paupers, the gaols, and the strikes. Everything's going wrong, and there's no good news anywhere.—Why, bless 'ee, he come into my forge the other mornin', and what's he do but begin foraging about among my tools and putting 'em to rights; making 'em tidy, he says, and upsetting things to that degree that every bit o' fire went out of the coals and put me all of a cold sweat.—"Be off, Bartle!" I says at last. "Get away out into the sunshine there and take a good drink o' that, and see if you can't clear all them cobwebs out of your brains." And with that, Squire, away he goes out of the place like a mad March hare!"

"Well done, Samson!" said I—"well done! If he would but take your advice, that wretched old croaker would be a different man in a month,

instead of a nuisance to himself and all his neighbours.—Good-night, Samson.—How's the wind?"

"West, sir—west to everybody in the place but old Bartle.—But he keeps his own weather-cock, he do, and it's nothin' but "East-by-north-east," and dirty weather. It's a pity such people was ever born."

As I wended my way home through the wood and watched the soft mellow sunshine glinting down among the tall trunks of ruddy beech, and lighting up the green pathways with patches of golden splendour, it seemed a pity indeed that such miserable failures as old Elzie should exist to mar the beauty and peace of the whole scene. The smith's words were true words: it does seem a mistake that "such people ever was born." Perhaps, in his heart that miserable old bachelor himself inclines to the same way of thinking at times, and he, too, imagines that the world would have been better without him. If so, and he should feel tempted to write his own epitaph, I can save him from all further trouble on that score, in the words of a wise man and a wit of some two thousand years ago (Epicharmus, *Epigrammata Græca*):

At seventy winters' end I died,
A cheerless being, sole and sad.
The nuptial knot I never tied,
And wish my father never had.

WITHIN THE VEIL

I CANNOT hear thy beating heart;
How strangely still the pulsing vein;
Closed are the eyes: those starlets twain;
I call; but all my words are vain;
Comes now no answer back again,
For cold and dead, dear love, thou art!
Yet hast thou joy, and not the smart:
Thou dost not feel my tender pain;
Thine eyes distil no tearful rain;
And thou with sorrow hast no part.

Come in the silent night to me;
Come when the morning spreads her ray;
Come in the evening calm and gray;
Come from the bright land far away,
Where hearts are glad and moments gay;
Come with thy footstep light and free;
Come with thy tongue's sweet melody;
And stay, love, by the ingle stay.
I wait, love, for the coming day,
The re-uniting hour with thee!

Where is thy brightsome dwelling now?
Art thou, love, in the solar beam?
Hear I thy voice in singing stream,
Or Melody's diviner theme?
Will eye meet eye in slumber's dream?
Behold thine eyes the winter's snow?
Or wend, dost thou, where flowers grow,
And light illumines eternal day?
Or leavest thou its brightsome ray,
To follow wheresoe'er I go?

THE ALPINE ACCIDENTS OF 1888.

TAKING into account the fact that the fall of snow in the Alps during the winter of 1887-88, and especially during the months of January and February 1888, was the heaviest that can be remembered for many years—a circumstance which boded ill for mountaineering in the ensuing summer—the number of accidents in the high Alps during the past season must be considered small. It certainly did not reach the appalling frequency of fatal disasters that marked the previous year, when twenty persons met their deaths, either through their own foolhardiness or by misadventure.

The death-roll of the past season includes ten persons. Strangely enough, the first fatal accident took place in the Salzburg Alps, where excursions are looked upon as not at all perilous, but which nevertheless contain hidden dangers, as the accident in August 1887 proved. On that occasion a young student, a practised mountaineer, lost his life in a snowstorm. Again, the accident by which Herr Josef Zulehner, a merchant of Salzburg, was killed occurred as early as May 1, 1888. That gentleman and his eldest son left Salzburg on that day by the local railway for Drachenfels. Thence the two, both experienced climbers, started for the Bachkaser, considered perfectly free from danger. This time, however, the upper portion of the path was found impassable, owing to its being blocked by trunks of trees and rocks, brought down by avalanches. Herr Zulehner now went in search of another path, to the so-called 'Jägerhaus,' but lost his way, and finally reached, after much heavy work, a mountain top. When descending thence towards the Russboden, father and son arrived at a series of precipitous rocks. Herr Zulehner, junior, descended a small rock only about seven feet high, and rested his alpenstock against it, to facilitate the descent of his father. The latter put his foot on it, using it as a kind of step, slipped, lost his hold, and fell, dragging his son with him in his fall. Both rolled down a

steep slope for some distance. The son, who had hurt both his arms, rose, and noticed with horror that his father was bleeding from an ugly wound in his head, and unconscious. He dressed the wound as best he could, to stop the bleeding, and ran for assistance as fast as his own injuries permitted him; but when help arrived, Herr Zulehner had been dead some time.

While this fatality was entirely of the nature of an accident, the same cannot be said of the next fatal mishap, on July 25, which occurred also in the Salzburg Alps or Salzkammergut (on the Dachstein, near Gmunden), and by which two lives were sacrificed. A party of three tourists from Judenburg had successfully ascended the mountain without guides; but in descending a perpendicular ice-wall thirty-three feet high, the foremost, Dr Zeitlinger, lost his footing, and dragged one of his companions, Herr H. Thannheiser, with him. Dr Zeitlinger was killed on the spot; and Herr Thannheiser expired while being removed to a place of shelter. The third of the party, Herr L. Thannheiser, escaped with his life. The ascent and descent of the Dachstein are described as free from danger, but under no circumstances should they be undertaken without local guides. Dr Zeitlinger was an experienced mountaineer, although not a member of the Austrian Alpine Club.

The Dent du Midi (ten thousand four hundred and fifty feet) is a most formidable mountain when covered with snow, as it was in the past season, but otherwise not especially difficult. A splendid view is obtained from it of Mont Blanc and the Alps of Valais, Dauphiné, and Piedmont. This mountain exacted last year two victims, one of which was an Englishman. On August 11, two tourists, Messrs Ball, fell over a precipice while descending from the Dent du Midi; one being killed, and the survivor, Mr Frank Ball, seriously injured. Two different accounts have been received of the cause of the accident. According to one report, having safely reached the summit, in returning, instead of descending to Champéry, whence the ascent was made, the travellers decided

to come down the mountain on the Vernayaz side, into the Salvan Pass, one of the three principal passes from the Rhone Valley to Chamonix. The guide refused to accompany them, for what reasons has not been learned; but whatever these reasons were, the tourists ought to have given in to his better judgment. They elected to go alone, and the result was a disaster. Another account states that there was nothing rash in the course which Messrs Ball took, and that the accident, resulting from recent snow-concealing ice-covered rocks, was one which could have occurred even to an experienced guide. Moreover, both tourists had had experience in Alpine climbing, and Mr Frank Ball is a member of the Alpine Club, and has been familiar with mountain-work under its various aspects. This only goes to prove that even experienced men ought to subordinate their judgment to the discretion of professional guides.

This accident was rapidly followed by one on August 13, when a young German, Herr Pietri, only eighteen years of age, fell over a precipice and was killed. In this case, unpardonable negligence was the cause. The party, of which the unfortunate victim was one, consisted of five persons from Montreux. They were quite unprepared for the expedition, having no guide, no ice-axes, and no ropes. They made a successful ascent, however; but in returning, the foremost of the party slipped down the smooth frozen surface of a steep snow-field over a precipice. If the party had been roped, the accident would in all probability not have happened.

On August 16, a young student of München, Herr Georg Winkler, attempted to ascend the Weisshorn, canton of Valais, without a guide, and in the face of strong remonstrances, and since that time nothing has been heard of him. His body will probably never be discovered, for it has been ascertained that the young man, only eighteen years of age, in ascending was overtaken by an avalanche, thrown down, and buried. The way he had taken could be traced to nearly the top of the Weisshorn, where the avalanche crossed his path. About the same time, a fatal accident happened on the Chamossaire, above Aigle, on the road to the Ormonts, the victim being the only son of parents residing in the neighbourhood, who was out on the mountains searching for *edelweiss*.

On August 20, a sad accident, resulting in the death of Michael Innerkofler, one of the best guides known in the district, occurred on the glacier of Monte Cristallo, Southern Tyrol. He had ascended the mountain from the Schludersbach with two German tourists in safety, and the descent was successfully made as far as the Cristallo glacier, when, in crossing a bridge of ice spanning a wide crevasse, it gave way, and the three, roped together, fell. If it had not been for the bravery of the guide Mansueto Barbaria, and two of his fellow-guides who had taken another party up the mountain, and who witnessed the accident, probably all three would have perished. But, owing to the rapidity with which he rendered succour, the two tourists were saved. Poor Innerkofler, however, was past help, and he succumbed to the dreadful injuries he had received in his fall down the crevasse. The faulty

and unbusiness-like way in which roping together is done by the Tyrolese guides, however brave the latter may be, is considered the cause of the death of one of the best of them.

The disappearance of Mr Rudd, an Englishman, who was a resident at Obermais, near Meran, Tyrol, is also probably due to an accident. Mr Rudd, on September 13, started alone on an expedition to Ala. The last trace of him was found at Bedole, where he stayed for the night, and in departing stated that he would go over the Presena Pass and the Mandron Glacier to Ponte di Legno. As the passes over the glacier are very dangerous, and Mr Rudd went without a guide, it is supposed that he met his death there. Six guides were despatched by the family to search for the missing gentleman; but no traces were found of him.

On October 5, the body of a tourist in an advanced state of decomposition was found at the foot of the Cima della Pala. The description of the body agrees with that of a traveller who entered his name in a hostelry at Landro as Reinhold, of Vienna. Herr Reinhold stayed for about a fortnight at Landro, and always undertook his excursions in the Ampeza and Sexten dolomites, even the most difficult, without a guide. He stayed away for days in his excursions, and thus his long absence on what proved to be his last expedition, to the Cima della Pala, was taken no notice of. It appears that the tourist slipped in descending from the mountain, sustaining injuries which rendered him unconscious, and that he was frozen to death in that state. This was the last fatal accident of the season.

It will be observed that most of the accidents were due to the fact that the tourists, from unexplained motives, undertook perilous expeditions without guides or without being properly equipped. Nearly all of them, however, had had experience in mountaineering, and this is rather a good feature, seeing that there are persons who undertake ascents for which they are not qualified by previous work, and in others are prompted to make them by motives of vanity. What will be thought, for instance, of the gentleman who dragged a young girl, aged thirteen, up to the summit of Mont Blanc, merely for the sake of making a display? If report is true, the young lady was so fatigued on returning that she had to be carried down part of the way. This is an abuse of a healthy exercise, which ought to be deprecated by all persons whose sense of propriety is not blurred by a love of éclat. The ascent of Mont Blanc, undertaken in October by M. Janssen, the President of the French Academy of Sciences, was quite another matter. And he only went as far as the Grands Mulets, and in the interest of science, to make some scientific observations in that elevated altitude. He stayed at the hut of the Grands Mulets three days and four nights, the thermometer registering twelve degrees of frost. He was accompanied by a large party of guides, as well as by his daughter, who probably attended from a sense of filial piety towards an aged father. The descent was made in a kind of sledge of M. Janssen's own invention, constructed of sheepskins, and which, we trust, the lady shared with her esteemed parent.

The total number of fatal Alpine accidents proper amounted in 1888 to ten, against twenty

in 1887, as already mentioned. The number of deaths in the latter year was swelled by the terrible Jungfrau disaster, in which six mountaineers in full manhood lost their lives owing to misadventure. It is sad to think that the death-record for last year should have been increased by a fatality in that other and grander alpine field, the Caucasus, to which four proved mountaineers have fallen victims. Although, strictly speaking, outside the range of the country with which we have been dealing, it is deserving of a brief reference here. From the official account which has been published of the Caucasus disaster, we learn that Mr Donkin and Mr Fox, accompanied by the two Swiss guides Streich and Fischer, arrived at the beginning of August at the village of Urusby, at the foot of Elburz, whence they proceeded to Bezingui. The party set out on August 15 for the glaciers of Bezingui, in order to reach the Kachkan Tau. The interpreter and a native guide were sent to Balcaria, where they were to await the return of the party, with orders to send horses and provisions to the refuge established at the foot of Mount Dykhtau, about twenty miles from Balcaria, and not far from the Schari Pass, which leads into the province of Koutais. These orders were carried out; but the party not returning, the authorities were informed of the prolonged absence of the travellers, and search-parties were then sent out. Traces of the travellers were found as far as the summit of Kachkan Tau, seventeen thousand and ninety-six feet. At different points, near large crevasses, pieces of boots and axe marks were discovered, the travellers having, in the opinion of the natives, chosen the most perilous paths. It is supposed that the travellers either were buried in an avalanche or fell into a crevasse. Owing to the advanced season, no further investigations could be made.

JOHN VALE'S GUARDIAN.

CHAPTER VIII.

In the course of a month or two, John being by this time regarded as hopelessly intractable, Uncle Robert began to see that Fortune looked upon him with a smiling face. Nobody accused him, nobody blamed him, nobody suspected him of desiring to do anything but his duty by the pitiable and worthless creature left to his control. It was generally known that the boy was 'soft,' that is to say that he was almost but not quite an idiot. The bullying, mocking, pitying régime had brought him to that pass in so short a space of time.

To tell the truth, this rapid realisation of his hopes removed all sense of criminality from Uncle Robert's mind. There had never been any very oppressive sense of his own wickedness there—as, indeed, how should there be, when John's position and his own had been so evidently in need of rectification? He felt such a claim upon the property on the grounds of justice and common-sense, that any measure which transferred it to his own hands looked right and reasonable—almost. And the thing being so easily done, looked as if it must have happened in any case. He sturdily refused to believe that

he had hastened the catastrophe; and that amazing inward effrontery which everybody has, more or less, enabled him to tell himself that he had never meant to hasten it, or taken anything but common-sense means against it.

If there was anything which disturbed his felicity, it was the reflection that John would be a burden upon the estate; but he comforted himself with the reflection that the charges would be but small. He knew a case where a well-to-do father had left his estate in equal parts to his twin sons. One of them had grown up with a weak intellect; and the other boarded him at a farmhouse and paid a hundred a year for his maintenance; whilst he himself lived in a big house and kept his servants and carriages. Nobody thought the worse of this gentleman, and it was certain that the unfortunate brother had as much as he wanted or knew how to enjoy.

Before the body of John Vale the elder had lain three months in the ground, John Vale the younger was the unresisting fag and butt of half his schoolfellows, and Mr Macfarlane's tool of mental culture was more employed upon his wretched little body than upon that of any other two of the little crowd subjected to his tyrannies. But he had one friend whom his feebleness could not alienate, and who stuck to him the closer because of the ills that fell upon him. Master William Gregg fought his battles, and accepted the responsibility for many an act of helpless mischief, and did his lessons until it became quite useless to do them any longer, and generally played his part of protector with a bulldog fidelity natural to him. It became so certain that any boy who wanted to bully John had first of all to walk over the prostrate body of Master Gregg, and that youth was so difficult to walk over, and would be to-morrow so completely oblivious of to-day's defeat, that at school-hours the forlorn innocent was at last left alone. In the days of health, he had been the brightest and cleverest lad in the school, full of courage, gaiety, high spirits, and mild dreams. He could jump farther in those days, and run faster, and learn his lessons with less effort than any one of them, and to the bulldog Gregg he had been a sort of Admirable Crichton. Everybody has seen and known these ungrudging romantic admirations and friendships amongst boys. John's fall from glory only made William Gregg the more loyal to him; and William went on his way in life in pretty constant heart-burning, because of the ill-usage his chum suffered. His days and nights were filled with dreams of the time when he would be as big as Macfarlane, and would be in a position to revenge himself for all the purposeless thrashings John now took at his hands. You cannot expect to have all the bulldog virtues and to escape all the bulldog shortcomings. Master Gregg was fully assured that as soon as he saw the remotest chance of repaying the schoolmaster, he should do it, and he hoarded up capital of wrath and added compound interest at such a rate as was warranted by no rules of arithmetic, into which Macfarlane had yet inducted him.

The explosion came before he had meant it to come, for on a certain brightly showery day in April, the schoolmaster was in more than common form, and had John out three times. On the first occasion, Master Gregg's sense of

compound interest was worked at the usual extravagant rate, but no more; on the second, it assumed proportions which would have appalled the greediest of usurers; and on the third there were no figures to express it.

'Walk this way, Vale,' said Macfarlane, with an air of resigned fatigue, bent upon duty. 'I had hoped that the day's warning would have been sufficient, and that you would have been induced to prosecute your studies with some slight willingness and attention. I observe with regret, that it is not so, and that I must repeat the lesson.' All this was wasted on the hapless John, who did not even know that the magistral voice was addressed to him, or what it said. 'Vale!' roared the bully, glad of the opportunity for flying into a passion, which this indifference gave him. He loved a rage, for it was the only outlet he knew from the tedious routine of his life. Nothing else lighted his blood to fervour, or quickened his heart-beats, or in any way fanned the ashes of his inward fires. 'Come here, sir!' He smote the desk with his cane so fiercely that every boy winced and winked.

The wretched John lifted his dull pale face with the grime of tears all over it, and arose. Young Gregg rose also, with a face even paler. He held in one hand a ruler, and with the other he fished a leaden inkstand from its hole in the desk before him, and stood with the ink dripping from his fingers. His heart beat with such monstrous thumps that every pulse shook him from head to foot, and his voice quaked as he spoke: 'Stop where you are, Jack.'

Only that New Englander of Lowell's who figured to himself a potato 'all on end at being boiled' could find a figure to do justice to the schoolmaster's amazement. It positively took his breath away. The boys looked on in wonder and wild awe, as at some dread cataclysm in nature. Gregg and the schoolmaster looked at each other in silence.

'Vale,' said Macfarlane, 'I will attend to you later on. Stay where you are.—Come here, Gregg.'

Gregg, with the dripping inkstand in one hand and the ruler in the other, stepped backward over the form, and walked slowly into the open space between the front desk and the fire-grate.

'Put those things down,' said Macfarlane. The boy shook his bulldog head and kept his glittering wicked eye upon the schoolmaster's, but said nothing.

There was a dreadful combat, but it was all unequal. So long as there was an ounce of fight left in him, the bulldog fought, and so long as Macfarlane could thrash he thrashed. In such a battle, blows fell anywhere, and the boy's face was wealed and streaked with blood when it was over.

The schoolmaster retired, leaving further discipline in the hands of the usher. Master Gregg, gathering himself together, walked to the desk and helped himself to water from the master's carafe and tumbler. He was white, except for the flushed and swollen streaks on his face, and trembled so much that he rattled the glass and water-bottle together noisily and spilled a good deal of the water when he drank. He propped himself against the desk, and from time to time drew the body of his hand gingerly across his

face and then looked at the blood upon it. The usher was awe-struck, and hardly dared to take notice of him. He was a young man of constitutional timidity, and was not overfed. The boy's dogged ferocity and quiet had frightened him, and perhaps in his heart he was not altogether on the tyrant's side.

An hour went by before Macfarlane came back. He had been busy in the interval with diachylon plaster, vinegar, and brown paper, and other such mild curatives for abrasions. Master Gregg looked at him as he entered; but the schoolmaster went by him without notice and took his customary seat, but with something more than his customary care.

'Boys,' he said, 'you have seen the punishment which is inflicted upon insubordination. You have witnessed an attempt to violate and set at nought the salutary and necessary discipline of the school. It is now my duty to show you that nothing can subvert that discipline or overthrow it.—Vale, come here!'

'Stop where you are, Jack,' said the dogged chum. If anything, the awe and amazement that fell upon the listeners transcended the first shock. Somehow, Master Gregg had provided himself with another ruler. He spat upon his hand and clutched it, workmanlike, twisting it until he had a firm hold upon it, and he looked so very unconquered that Macfarlane was more than half afraid of him.

'This has all to be gone through again, Gregg, has it?' he asked with an attempt at humour which sat rather uneasily upon his face and rang rather false in his voice.

'Seems so,' said Gregg, with an accent which sounded a hundredfold more daring and insolent for being purely commonplace. 'I shan't stand by and see him licked. He can't learn his lessons, and you know he can't learn 'em. It's no use licking him,' he concluded in an almost argumentative tone.

'I should have thought, Gregg,' said the schoolmaster, 'that your lesson would have sufficed you.'—Gregg shook his head with perfect solemnity.—'Do you presume to imagine that you will be allowed to dictate the discipline of the school?'—Gregg shook his head again.—'If I am compelled again to administer chastisement, I shall not spare you, Gregg; but I am not disposed at present to inflict further punishment if I can avoid it. Go to your seat, sir!—A third time Gregg shook his head.

'You won't lick Vale again, sir,' he said, as if he had made up his mind upon the question.

Macfarlane, for the first time in his life, concluded reluctantly that nothing but bamboo would meet the case. There was another battle, which ended as the first had done, and ended sooner. Master Gregg's nerves had broken down, and he was sobbing and weeping at the end of this encounter; but when Vale was called again, he got to his feet and spluttered, 'Stop where you are, Jack,' with as wilful a determination as ever.

'Mr Johnson,' said Macfarlane, addressing his assistant, 'I shall be obliged to you if you will make a personal visit to Gregg's father and inform him that I have been compelled to expel Gregg from the school.'

The usher whispered that the hour for the

dismissal of the school had passed, and the school-master welcomed the intelligence.

'You may go, boys,' he said.—'I will deal with you to-morrow, Vale.' And with that he withdrew.

Master Gregg got home with difficulty, and found that the usher had been there before him. Gregg, senior, who was all for the sustenance of authority, conceived it to be his duty to horse-whip William, and did it—thereby setting more machinery in motion than he dreamt of; for if it had not been for this supplementary flogging, Uncle Robert's delightfully simple plan would in all probability have prospered, and such starved root of wit as lived in young John's brains would have perished altogether.

When William had digested his flogging, he was allowed to take his supper and retire to rest without much further notice. The first thing he did on reaching his bedroom was to lock himself in, and being thus safe from observation or intrusion, he set to work to pack up sundry simple necessities, which he tied together in a handkerchief. Next, from the bottom of a small wooden trunk which belonged to him he extracted a glazed earthen money-pot, which gave forth a heavy muffled noise as he shook it. After having vainly tried to coax the coins it held through the slit at the top by means of a straw, a folded leaf of his copy-book, and the end of a lucifer-match, he laid the earthen treasury upon the bed and there broke it with a tap of the poker, having previously laid his jacket over it to dull the sound of the blow. He gathered up the shards and hid them carefully beneath the fire-grate, pushing them as far out of sight as they would go. Next he counted his treasure, and made out three shillings and fourpence in coppers, and one shilling and sevenpence in threepenny and fourpenny pieces. From his trousers' pockets he drew such a variety of miscellaneous articles as boys love to carry, and amongst them a solitary penny piece, sticky with cobbler's wax and toffy. Having counted it over with extreme silence and caution several times, in the vain hope of making more than five shillings of it, he tied it all together in a strip of rag and put it under his pillow. Then he undressed and got into bed, and after some sore-sided tumbling and tossing, fell asleep.

It was pitch-dark when he awoke, but he was out of bed in an instant. He lit his candle and dressed with great quiet and expedition; and so with his bundle in one hand, his boots in the other, and his handful of money bulging out of one of his pockets, he stole noiselessly downstairs. The clock ticked sternly at him, and the house-dog's cold nose thrust suddenly into his hand in the dark brought his heart into his mouth. The lock and the bolts of the door were rusty, and creaked dreadfully as he withdrew them; but though he listened with all his ears, he heard no sound of movement in the house. The night gaped at him, black, chill, and starless, when the door was open, and the widespread world looked cheerless enough. But he had made up rather an unusual mind for a boy of his years, and perhaps had rather an unusual mind for a boy of his years; and stifling any misgivings that may have assailed him, he slipped into the open air, closed the door behind him, and stole away.

He looked back once at the house he was leaving, and found suddenly that he had no rancour in his heart. But he turned round again to the bare world he had made up his mind to face, and trudged on in a growing darkness until he reached the Jacob's ladder and mounted to Scott's Hills. There he sat down upon a stile to wait for daylight—which proved a weary business. He dozed several times, and awoke, nipped to the bone by the chill air of early April; but at last, in spite of sore bones, and cold, and the loneliness which was worse than anything else or all other discomforts put together, he fell sound asleep again, until the morning sun shining full into his eyes awoke him.

He rose to his feet, shook himself, and pursued his way towards the town. Arrived there, he found the earliest inhabitants already leisurely taking down their shop-shutters, or sweeping out their shops or leaning on their brooms to exchange the slow-going news of the place across the street. He could not rid himself of a sense that everybody was aware of his intent, and that he was running away from home; and this feeling, if anybody had noticed him, might have given him a furtive look as he sped along the high street towards Robert Snelling's house.

Snelling's house stood three or four doors from a side-street which branched off from the main thoroughfare; and from this side-street branched off in turn a narrow blind alley, in which were situate a bakehouse, a wheelwright's workshop, a stable or two, and a granary. Doors opening off the alley led to the back-yards of dwelling-houses, and in one of them, as fate would have it, young Gregg saw the chum for whose sake he had suffered, languidly and dreamily blacking a pair of boots. It was part of Uncle Robert's household economy that the young should have this kind of office imposed upon them, and he had set John the task with all the greater willingness because the boy had never been accustomed to it, and it hurt his pride.

The runaway tried in vain to signal his companion by whistlings and rappings, and at length growing desperate, ventured within the yard and called him by name. At that John turned and came towards him.

'Come outside,' young Gregg whispered. 'Come with me.'

Young John obeyed unquestioningly; and when William began to run with a backward inviting glance and gesture, he followed. They ran up the by-street until they came to an open piece of waste land with three or four abandoned houses on it, deserted by some bankrupt contractor, and long since left to fall to ruin and decay.

'Where are you going? Will?' he asked then.

'I have run away from home,' Will answered. 'I am going to seek my fortune, if you'll come with me. Do come, Jack. What have you got to stay for? Macfarlane will give you a hiding if you go back to school. He'll always be doing it. You can't learn your lessons, Jack; it's no use trying. Will you come?'

John looked frightened, and hesitated.

'Come along,' the other urged him, taking him by the hand. He obeyed the impulse, and they set out together. 'I'll take care of you, Jack.'

The bulldog heart was as warm and tender and valiant as ever yet a heart was in the world. 'You cheer up, old chap; they shan't hurt you any more.'

ON THE ARTIFICIAL PRODUCTION OF FIRE.

WHEN the pursuits of hunting and fishing or other causes led primitive man into the colder regions of the earth, the warmth of fire for bodily comfort, as well as for the preparation of food, must have been one of his first necessities, and the artificial production of it one of the earliest objects of his ambitious ingenuity. Modern savages in tropical and sub-tropical climates produce fire by the friction of dry and inflammable wood, rotated either by the hands or by a bow closely resembling that employed with a drill. Such a method of producing fire works very well in dry climates, where wood suitable for the purpose is abundant; but it is evident that it would not be so satisfactory in those countries where, with the exception of a small part of the year, dry wood is an object of considerable rarity. To a man in the early stages of civilisation, the accidental production of a spark of fire by the concussion of flints and iron-pyrites, or iron-stone, may have suggested such a means for the attainment of his desired object; and, it may be added, the occurrence of these two minerals together, as is often the case, gives great probability to such a theory. The kindling of a fire by means of dry grass was but one step further, and followed naturally upon the first discovery of the accidental spark. The substitution of flint and iron-stone for the friction of dry wood in the production of fire marks a decided step in the advancement of civilisation. The object was attained with less expenditure of time and labour than by the old method, although it was of course practicable only where flints and iron-stones were easily obtainable.

Man, as several writers have pointed out, is the only fire-making animal. Other animals have the skill to build houses for protection from the weather and from enemies; are swift in the chase, and, in point of strength, are in many cases superior to man. But this particular attribute of fire-producing belongs to man alone, and, were there no other mark of distinction between him and the brutes, this would of itself show him to belong to an order, in degree at least, pre-eminently above them.

Among the very earliest specimens of man's handiwork which have been preserved for our examination—namely, chipped and wrought flints—there are to be found many that bear in the character of their shapes, and external markings the clearest possible evidences of having once served as 'strike-a-lights'; and in some cases the actual fragments of iron-pyrites with which they were used have been found in close proximity to them, thus indicating, with a probability which almost amounts to certainty the original use to which they were applied. Among many thousands of paleolithic and neolithic flint implements which we have had the opportunity of

closely examining, were a great many forms which there is no hesitation in saying belong to this class. Many of the forms which sometimes have been regarded as 'scrapers' of a rough and uneven type are nothing more than flints which have been so used. The essential quality of such a flint was that it should be capable of throwing off small splinters when brought in sharp contact with a mass of iron-pyrites. The scraper-like form of flint was particularly suited for such a purpose, presenting a tolerably acute angle to the object upon which it was impinged. Several specimens in our collection—gathered chiefly from West Kent—bear indentations which have resulted probably from having been used with thin flakes or strips of iron-stone, such, for instance, as are very abundant in the greensand of Sevenoaks and the surrounding district. As such fragments are occasionally found among the tertiary deposits in and around West Wickham, there is good reason to suppose that such means were used for striking a light, although we are bound to say we have not yet succeeded in finding any particular piece of iron-stone which looks as if it had been used for such a purpose.

The ancient inhabitants of the East were familiar with the use of magnifying glasses and reflectors for producing fire from the sun's rays, and there are in the writings of classical authors numerous allusions to such customs; but there is no reason to suppose that such means were ever largely used in England. The frequent absence of bright sunshine would often render any such attempt to obtain fire wholly ineffectual.

For many centuries the tinder-box, or something closely analogous, must have been the only means by which fire was artificially produced in England. The writer possesses an old tinder-box which had been used for many years, but of course since the introduction of matches it has been cast away as mere lumber. As an original specimen of the common type of those indispensable accessories of domestic life during many centuries, it is of considerable antiquarian interest, although it is of no intrinsic value whatever. It is a circular box of tin, four inches in diameter, and an inch and a half in height. It originally possessed a lid, which was probably furnished with a socket for the candle, by means of which the flame developed from the spark on the tinder was preserved; but unfortunately the lid is lost. The steel, shaped to fit the hand, upon which the flint was struck to produce the spark, and flat plate of tin, designed to extinguish the smouldering tinder which the spark had ignited, both remain, and the steel bears marks of long-continued wear. A fragment of flint, too, which is in all likelihood that used for producing the sparks, has been considerably chipped and bruised by repeated contact with the steel; and it is interesting on that account, as showing what really is the effect of such wear. Upon comparison, we find that there is no important difference between this flint and those which we have described as having been found in conjunction with neolithic implements. On the contrary, it bears a strong resemblance to them; and what few variations there are, are only such as would necessarily arise from the variation in the time which has elapsed since the flints were chipped and broken. Some

of the tinder remains in the box, and we have often succeeded in producing a light from it by striking the steel, held firmly in the left hand, with the flint in the right, the blow being directed towards the tinder-box. When the small spark of red fire generated by the minute chip of flint appears, it is necessary to fan or blow gently upon it until it has grown to a small patch of fire. Then, upon the application of a thin strip or splint of wood, previously tipped with sulphur, the desired flame is produced, and the tinder in the box may be extinguished by simply putting on the lid. The whole process, after practice, occupies less than half a minute; but if the tinder be not perfectly dry, perhaps five or ten minutes may be required to produce a light. Tinder is made by burning old cotton rags, and extinguishing them before they are completely consumed by the fire. Other kinds of tinder are made from dried fungus. It seems almost incredible that, with the knowledge of chemistry which was possessed during the last two or three centuries, such a clumsy and difficult method of producing fire should not have been superseded by one more easy and expeditious.

The invention of 'lucifer matches' in 1827 marks the commencement of a very important era in the history of our subject. Before that date, it is true there had been certain chemical means used by which a light was produced, but they were merely exceptional cases. Friction matches were invented by Mr John Walker, of Stockton-on-Tees, in 1827. For many years he occupied a small shop, No. 59 High Street, where he carried on the business of an apothecary. He appears to have been a tolerable chemist; and, being interested in studying the properties of phosphorus, it is probable he discovered its suitability for the production of light in the course of his researches. For several years he sold the matches he made in pasteboard boxes containing fifty matches for one shilling per box. By this lucrative business he saved enough money to retire; and on the 1st of May 1859 he died at the age of seventy-eight years. A letter relating to Mr Walker's valuable invention has been contributed to the *Northern Echo* by Mr Alderman Jackson. It is so interesting that we shall make no apology for reproducing it here:

SIR—I have not the slightest doubt that the invention of lucifer matches is due to our late fellow-townsmen, Mr John Walker, chemist and druggist, who had for his place of business the shop No. 59 High Street, Stockton. I knew Mr Walker personally and intimately, and have had many a friendly chat with him both on this subject and others. In the year 1860 I sent a communication to the *Illustrated London News*, in consequence of an article in that journal with the heading, 'The Origin or Invention of Lucifer Matches.' After alluding to the tinder-box and phosphorus match-boxes, it is stated: 'Suddenly and successfully, but where we have not been able to learn, the lucifer matches invaded the province of the old tar matches.' Before replying to the article in the *Illustrated London News*, I communicated with an old friend, the editor of a local newspaper, who confirmed my conviction that the world at large is indebted to Mr John Walker for this very useful

invention. I may say that Mr Walker was frequently and urgently pressed by his numerous friends to take out a patent; but he always declined, saying it was not worth the while doing so, considering the simple and trifling nature of the article. Mr Walker died in Stockton in the year 1859. The facts as stated in the local paper to which I refer were published in 1852, and were as follows: 'Mr Walker was preparing some lighting mixture for his own use, when a match, after being slipped in the preparation, took fire by accidental friction upon the hearth. This was the first friction match, and the hint was not lost. He commenced making friction matches, selling with each box a piece of doubled sand-paper to set them in flames by pressure of the thumb and a sharp pull. It was in the month of August 1827 that he began the sale, and his first customer was the late Mr John Hixon, solicitor, of Stockton. Harrison Burn was employed to make the matches; and the boxes were made by Mr John Ellis, at three-halfpence each, the price of a box containing fifty being one shilling.' I think, after perusing the above, you will have no doubt that Mr Walker is really the inventor of this useful and now indispensable article. I have always endeavoured, in various parts of the Continent, as well as in England, to establish these facts, that justice may be done to the departed.—I am, sir, very respectfully,

RICHARD JACKSON.

STOCKTON-ON-TEES, May 6, 1871.

It is unnecessary to dwell upon the great improvements which have been made in matches since Walker's time. They can now be produced so cheaply that, we are informed, boxes of safety matches well made and neatly packed can be obtained for elevenpence per gross.

THE WESTERFIELD SCARE.

By T. W. SPEIGHT.

IN TWO CHAPTERS.—CHAP. I.

I HAVE been so often asked to tell the following story in the course of the forty years which have come and gone since the events narrated in it took place, that at last I have made up my mind never to open my lips about it again, but just to write it down in my own homely fashion, so that if anybody bothers me to tell it in time to come, I can put it before them in black and white, and bid them read it for themselves, which will be a saving of time and trouble to every one concerned.

My name is Reuben Holditch, and I was born and brought up in the little town of Westerfield, in the north of England, where my father, my grandfather, and my great-grandfather, and, for aught I know to the contrary, a generation or two of ancestors still further back, had filled, with credit to themselves and satisfaction to the public, the office of sexton to the grand old abbey church of St Mary's.

The ancient and reputable post in question having been held by a Holditch for something like a hundred and fifty years, it was looked

upon, from the time I can remember anything, quite as a matter of course, and as one of those things which are not open to question, that my father's son should one day follow in the footsteps of his ancestors, and earn his daily bread after the same fashion in which they had earned theirs. How the knowledge came to me that such was the mode of life which an unkind fate had mapped out for me, I cannot now call to mind, but from the very first I looked forward to it with loathing and dismay. Many a time my father would make me stand by him while he scooped out a grave in the black loamy soil, with the view, I suppose, of teaching the young idea how to dig. He was very proud of his handiwork, and would bid me observe the artistic finish—only those weren't the words he used—of all the details; but sometimes his spade would throw up the skull or thigh-bone of some previous tenant of the space he was now getting ready for another, and then I would turn away, disgusted and sick at heart, while my father would laugh lightly and say: 'It's nowt, lad, nowt at all, when once a body gets used to it.' But whatever my secret thoughts and feelings might be on the question of my future, I said no word to any one about them, and certainly my father was the last person in the world to have any suspicion of the degeneracy of his only son.

My father eked out his livelihood by making and cobbling shoes, as his father and grandfather had done in their time, so that the lapstone might be said to be as much an inheritance of the Holditch family as the churchyard itself. I, however, had little more liking for the cobbler's awl than for the spade and pickaxe; my thoughts and wishes went out and clung to something very different from either.

From the time when I was quite a child I had a great fondness for flowers. I know not whence the liking came, nor why it came, but there it was. One day, when I was about twelve years old, I was sent by a neighbour with a message to the head-gardener at Penigarth, Sir William Verinder's country-house, about four miles away. To me, the poor sexton's son, the gardens and glass-houses at Penigarth came as a revelation of beauty undreamed of before. The gardener, a kindly old Scotchman, was evidently pleased with my enthusiasm, and was at the trouble to show me over the place, eliciting from me by the way sundry particulars of my history. 'Weel, laddie,' he said to me at parting, 'everybody to his likes; but for my part, I'd sooner tend my bit flowers than howk graves.' I need hardly say that I was entirely of the same way of thinking.

From that hour my heart was set on becoming a gardener. My father, for his position in life, gave me what was considered in those days a fairly good education; but with my fourteenth birthday my schooling came to an end. He was a reticent man, and had said no word to me of his intentions; but I foreboded only too surely what they were. I was to be apprenticed to a shoemaker in the town, in order that I might learn the business thoroughly, then, after I should be out of my time, and as years crept over my father, I was gradually to work into the position of assistant-sexton, with the view of ultimately succeeding to all the emoluments and dignities

which so many of my predecessors had enjoyed before me.

Hereupon ensued the only serious difference of opinion that ever divided my father and myself even for a day. I told him plainly how utterly hateful to me was the idea of becoming a shoemaker, and how my heart was set on being a gardener. He was 'struck all of a heap,' as the saying is, and said some hard things in the heat of his temper. For a week or more he remained in the 'dumps,' hardly speaking a dozen words to me all that time. Then came another explosion; and then, finding I was not to be moved from my purpose, he gave way all at once, and told me I might do as I liked. All this had reference only to the shoemaking; not for a moment did he dream that when the proper time should come, a Holditch could be other than a proud man at succeeding to what might with reason be called the family estate in the abbey churchyard, and I was careful not to undeceive him. One day I overheard him say to his particular crony, Peter Philp: 'After all, when one comes to consider, there isn't such a vast difference between a grave-digger and a gardener. They both get their living out o' the mould, and both have to be handy with their shovels. And who knows, if this new-fangled notion of planting folks' graves with flowers and shrubs comes into fashion, but what Rube may be doing a good thing for hisself by learning all about 'em.'

So, with a fast-beating heart, I went to Penigarth and asked for Mr Ayscough. The old Scotchman had not forgotten me; and a fortnight later, through his influence, I was offered the post of under-gardener's assistant at Linden Villa, the house of a rich merchant in the outskirts of Westerfield. There I stayed for two years, picking up every scrap of knowledge I could lay hold of, at the end of which time a berth was found for me at Penigarth itself. Here several years slipped away almost without my knowing how, so happy and full of content was my lot. Mr Ayscough, who took great interest in me, had advised me to learn at least the rudiments of Latin, without which, he said, no horticulturist could be said to know his business in these days; so a great portion of my spare hours were given to the acquisition of that grand but difficult language. Almost as a matter of course, I had fallen in love by this time. The object of my passion was pretty Mary Lidford, the only child of her mother, who was a widow. Mary had nothing of her own in the way of this world's gear, and as my wages only just sufficed to keep myself, there seemed little likelihood of our being able to marry for several years to come. But that was a prospect which did not trouble us greatly. We were young, we loved each other, and we could afford to wait till brighter days should dawn.

I was a few months turned one-and-twenty when a sad accident happened to my father: he fell and broke his leg. The fracture was a bad one; it would be weeks before he would be able to leave the house, months before he would be strong enough to go about his work as usual. I was sent for at once, and had not been more than a few hours at home when word was brought that my father's services were needed. A parishioner was dead, and his grave would have to be dug

the following day. In this emergency my father naturally turned to me; and when I hinted that, seeing how little I knew of such things, it might be advisable to call in the services of the sexton of St Michael's, he gave me a look I did not forget for many a day.

'There was never a Holditch born who couldn't dig a grave,' he said. 'It comes nat'ral to 'em.'

After that, of course there was nothing for it but to do as my father's son was expected to do.

If the affair had ended there, it would not have mattered greatly, but it could not. It was evident that my father would be disabled for a long time to come; he must either find a substitute, or give up his post; and to have had to do the latter would, I verily believe, have broken his heart. I was to be his successor—on that point everybody (but myself) was agreed, and everybody seemed to think I could do no other than act as his deputy at a time like the present.

Of course I had to tell Mr Ayscough how matters stood. 'There's no help for it, laddie,' he said. 'Thou must go and bide with thy father till he gets better, and we must try and get on without thee for a while as best we can.'

It was in October, when the days seem to shorten so fast and the lengthening nights are already full of the prophecy of the coming winter, that my father met with his accident. I had not been more than three days at home before I was told something—not by one person only, but by a dozen at the least—which surprised me greatly, and set me wondering what amount of truth there could be at the bottom of it.

What I was told was this: That of an evening after dark, especially on those nights when there was no moon, or when it did not rise till late, the town was infested by a creature which was said to be half-man and half-monkey in appearance—the 'man-ape' being the term applied to it by general acceptance. The account given of it by those who professed to have seen it varied in some of the details; but all agreed that its body was covered with long coarse hair, that its face resembled that of the ape tribe in general, that its footsteps were inaudible, that its activity was something marvellous, and finally, that on the two or three occasions on which certain bolder spirits than common had ventured to go in pursuit of it, it was seen to vault over the railings which crown the low wall that encloses the abbey churchyard, and disappear among the tombs and grave-stones inside. At first this strange creature seemed to confine its pranks to frightening women and elderly people. It seldom or never made its appearance before nine o'clock, by which hour nearly all the shops were shut and the streets comparatively deserted. Then would it spring suddenly out from some dark corner or covered entry—and in our old-fashioned town such 'entries' were to be found in every street—and encircling the neck of the passer-by, which, five times out of six, was that of a woman, with one of its dreadful hairy arms, it would give utterance to a shrill gibbering cry, which all who had heard it declared to be like nothing human, and then releasing its victim as suddenly as it had grasped her or him, it would beat its breast for a moment or two with one hand, and then bounding away, vanish in the darkness. Several of the women thus assailed fainted with fright, and

were ill for days after; while on old Miss Glendovy the effect was such that she became subject to fits of nervous trembling, which she was unable to control to the last day of her life. Nor did the men fare much better. Mr Pybus, the tailor, was so scared that he took to his bed, and was not seen in his shop for a week to come; while Mr Wakeling, the corn-chandler, the moment his tormentor released him, gave vent to a yell which brought half the people in the street to their doors and windows. Doveton, the butcher, who stood six feet one in his stockings, was so terrified one night that it was said he never went out after dark for weeks afterwards without being armed with one of his own formidable knives; while two of the town constables fared no better than ordinary mortals, but considerably worse in one respect, seeing that both of them had their hats knocked completely over their eyes by their all but unseen tormentor.

It is not too much to say that before long a scare set in the like of which had never been known in Westerfield. Hardly a female would venture out of doors after eight o'clock unless escorted by one of the opposite sex, and not a child was to be seen abroad after dusk. Even the members of the Apollo Club, a convivial gathering of well-to-do people who met on two evenings a week at the *King's Head* for the promotion of harmony and good-fellowship, were reported to be so far affected by the general scare that when they broke up a little before midnight they preferred wending their way homeward by twos or threes to running the risk of being pounced upon singly by an anomalous hairy being after a fashion which was enough to throw any elderly gentleman into a fit. All sorts of absurd stories and exaggerations got about, as must inevitably be the case whenever the 'thousand tongues of Rumour' are all set wagging at once. It was reported that sometimes the man-ape had a plaster in his hand, which he tried to fix over the mouths of his victims; some who professed to have seen him would have it that he was at the very least seven feet high; while others averred that he was deformed, and had a huge hump between his shoulders. Others of the more ignorant were firmly persuaded that there was a strong smell of brimstone about the creature, and that his eyes glowed in his head like live coals.

At length matters came to such a pass that a number of the bolder spirits among the young men of the town banded themselves together with the avowed intention of hunting down the man-ape. Dividing themselves into a couple of gangs, each member of which was armed with a stout cudgel, they perambulated the town night after night from eight o'clock till midnight, vowing vengeance the most dire on the object of their hatred—if only they could come across it. This, unfortunately, small as the town was, they never succeeded in doing. The creature seemed to derive a sort of malicious glee from setting them at defiance. Thus, on more than one occasion, the 'vigilance boys,' as they had dubbed themselves, on turning a corner would find a woman in a half-fainting state, who had been waylaid by the creature only a minute or two previously. It may be that the 'boys' were too much addicted to chaffing each other, to rattling their

sticks on the pavement, and to acting in too demonstrative a manner generally in the course of their perambulations, to render their services of any avail; but be that as it may, the outrages still went on as heretofore. Not that they occurred every night by any means; sometimes four or five nights would go by without anything being seen or heard of the creature; while, as before remarked, it seemed to have a rooted dislike to moonlight; then, for two or three nights together, its objectionable practices would be resumed. Westerfield was fairly at its wits' end with terror and rage.

So far the creature's pranks had seemed actuated by nothing worse than a spirit of mischief, such as might be supposed to be in accord with its ape-like attributes; but when one morning a rumour spread through the town that on the previous night Squire Dullison had not only been assailed in the usual way, but had, in addition, been robbed of his gold chronometer, his purse, and a valuable breast-pin, it was felt that matters were becoming serious indeed. Mr Dullison, who was returning home from a friend's house at the time, was so prostrated by the dastardly attack as to be unable to leave his room for a week to come. His first act was to offer a reward of twenty pounds for such information as should lead to the capture of his cowardly assailant.

A few nights later, three young men made sure they had secured the reward. They were returning together from a dancing party, and having goloshes over their shoes, they made scarcely any noise in walking. Turning a corner, they came full upon the creature, who was advancing from the opposite direction, and who instantly turned and fled. The young men were so startled that for a moment or two they lost their presence of mind, but five seconds later they were in full pursuit. They were all good runners, and the chase was an exciting one. The night was clear and starlit, the time was between eleven and twelve o'clock, and the streets were deserted. Presently the creature, with its pursuers some forty or fifty yards behind, emerged from the tangle of side streets among which the chase had begun, into the main street of the town, which led, almost in a direct line, to the abbey, some quarter of a mile away. It was apparently bent on escaping as it had escaped before, that is, by scaling the spiked railings of the churchyard and being lost among the wilderness of tombstones inside. The pursuers put on an extra spurt; but their quarry, as if aware of it, did the same. Suddenly, to the intense surprise of the young men, the creature turned sharply to the left and disappeared up a narrow covered way known as Cooper's Court. But this move was explained a moment or two later by the appearance of a couple of constables approaching from the opposite direction. Cooper's Court being a *cul-de-sac*, with houses on three sides of it, the young men now felt themselves as sure of capturing their prey as one may reasonably feel sure about anything. They shouted to the constables to hurry up, and rushed helter-skelter through the passage into the court. Then they paused to gather breath and look around. But what had become of the creature? Three pairs of keen eyes scanned every corner of the court,

but to no purpose. Then an exclamation broke from one of them; and the others, following the direction of his finger with their gaze, could just make out a dusky figure climbing ape-fashion up the iron water-spout which ran from the roof to the ground between two of the corner houses of the court. The creature was climbing slowly, hand over hand and foot over foot, and was already three parts of the way up. The young men were so struck that they could not utter a word. Half a minute later the creature had reached the roof of one of the houses; then it turned and relieved itself by giving vent to a gibbering derisive laugh, if laugh it could be called, and scrambling nimbly up the tiles of the roof, disappeared on the other side. By this the two constables had come up, and they, as a matter of course, took the direction of the affair into their own hands. But by the time they had succeeded in knocking up the people in one of the houses and in getting leave to go through into the garden at the back, the creature could easily have got away three or four times over.

A QUARTETTE OF THEATRICAL TRIUMPHS.

JOHN STUART MILL, in a very characteristic part of his writings, says: 'Success in life may be compared to what we see at every crossing in a large city. At the crossing, one man arrives just in time to pass to the other side before one or, it may be, more carriages block up the way; but another man equally as smart comes up a second later and has to wait till the roadway is cleared of the obstruction. The first of these men, it may be, has caught the train which shall carry him to the scene of some lucky business transaction; whilst the latter, through the delay, may have missed the best opportunity ever presented to him in life.' On such a simile it is quite possible for many minds to enlarge, or even criticise; but on the whole, Mill's illustration is a very true one, for it is the lesson of experience.

All professions fall within the circumference of Mill's illustration; but none lies so near the centre as the profession of an actor. The stage, as a rule, presents to its votaries more blanks than prizes; and yet the boards are always crowded with men and women eager to rival a Garrick or a Siddons. Whence arises this constant supply? The answer may be inferred from the following facts. The actor in the course of his profession meets his fellow-men face to face; the author may write, but the praise due to his merits comes to him second-hand. Not so with the actor, for he can feel the enthusiasm of applause, which is meted out to him by a delighted and admiring audience. Hence it is that so many from behind the footlights challenge the verdict of their fellows; and one chance of success is eagerly laid against a thousand chances of failure. Such is human nature.

Failure is a term of frequent occurrence in the annals of actors; and to those who know all the realities of stage-life, it is pitiful to see and to meet men who have clung to their 'profession' for a lifetime without making the least advancement. It is not our intention at present to speak

of these, but rather to recall some instances of great and marvellous success.

And first, there is Garrick, who made his début in Goodman's Field Theatre, London, in October 1741. A worse time could not have been chosen, for during the previous month an Act had been passed regulating stage-plays. The result of this Act was that many theatres were closed, and hundreds of men and women deprived of their occupation. Many plans, however, were tried for the purpose of evading the statute; and it was under the shelter of one of these subterfuges that Garrick commenced his professional career. On the 19th of October 1741, placards announced that a concert of vocal and instrumental music would be given in Goodman's Field Theatre. The music was to be divided into two parts, and between the parts a representation of *King Richard III.* was to be given by a gentleman who was to act for the first time. The statement was not altogether correct, for Garrick had once acted at Coventry. An average audience was gathered when the curtain rose. Garrick acted splendidly; and this was noted by two admirable actors and critics—Macklin and Smith. Next morning, the *Post* gave the young actor a glowing criticism, which tended to raise the public curiosity. Pope heard Garrick the second night, and pronounced him 'the first actor of the day.' Crowds flocked to Goodman's Field; the western places of amusement were neglected; and before the performance begun, nobles, bishops, and legislators might have been seen struggling with each other for the empty seats. His first real venture was a success; he received thirty pounds a night, besides many benefits. But Garrick's triumphs do not end here. Pitt lauded him to the skies; and Murray, Halifax, Chesterfield, and Sandwich thought it an honour to count Garrick amongst the number of their friends. Fortune continued to smile upon him; and he continued acting till the year 1776. When he pronounced his 'Farewell,' and made his final bow from the stage of Drury Lane on the 10th of June, there was not a dry eye in the theatre. The whole audience re-echoed the word 'farewell' which had fallen from the gifted actor's lips; and in this way ended a true dramatic scene—a scene only dramatic in the sense that it was touchingly real.

Six months previous to Garrick's 'farewell,' there appeared on the same boards another aspirant—Sarah Siddons. Her part was that of Portia, in the *Merchant of Venice*; and she failed. Her delicate and fragile form clothed in a faded dress did not captivate the audience. Sarah was the protégée of Garrick, who was greatly disappointed at his apt pupil's discomfiture, for nervousness had entirely overpowered her. But Garrick did not despair; and another chance was given to the young actress. This time she was to appear as Lady Anne in *Richard III.*; but in the love-scene she forgot the directions given her in the morning, and Garrick's look was so terrible at a certain part in the play that she fainted. Failure was now her reward; Melpomene was not propitious.

Seven years passed; and by the end of this time the provinces were ringing with the fame of Sarah Siddons. The proprietors of Drury Lane, on the strength of this new popularity,

re-engaged her. Two weeks before the advertised date, Sarah was minus a voice and was again afflicted with her old nervousness. Isabella in *The Fatal Marriage* was her rôle, and when the curtain rose she soon displayed her powers. The sweet tones of her voice melted men into tears, and her tragic acting threw women into hysterics. She had at length triumphed, and the theatre-goers of London were at her feet. 'When I reached my own fireside,' she thus graphically writes, 'from that scene of reiterated shouts and applause, I was half dead; and my joy and thankfulness were of too solemn and overpowering a nature to admit of words, or even tears.'

The first night was a prelude of what followed. Fox and Sheridan might have been seen weeping in their seats; and when great men weep, what of those who are not accounted great? The engagement brought her fifteen hundred pounds. Next year she received two thousand pounds, and her two benefits each amounted to fourteen hundred and fifty pounds.

Her second visit to Edinburgh was a remarkable one; two thousand five hundred and fifty-seven applied for seats in a theatre which could only accommodate six hundred and fifty persons; and it was quite common for footmen to retake on the same night the places newly vacated by their masters. Audiences are sickle, for when Sarah Siddons first visited Modern Athens she was very coldly received; the only praise she got was from a man in the gallery, who called out to the actress at the end of one of her best parts, 'That's no sae bad.' Our readers may not be aware of the strange coincidence which marked the second visit. While the actress was representing the heroine (Isabella) where she calls out, 'My Biron! my Biron!' a lady was seized with hysterics and had to be removed. The unfortunate lady was Miss Gordon of Gight, afterwards the mother of Lord Byron.

Sarah Siddons took her leave of the public on the 29th of June 1812, in her great character of Lady Macbeth. She never acted better; and when the sleep-walking scene was finished, the audience demanded that the play should terminate, this being in those days the highest form of showing approval. Subsequently, she occasionally consented to reappear on the stage for charitable ends.

Another remarkable theatrical success was that of the boy Henry West Betty. Born of Irish parents in the year 1791 at Shrewsbury, he very early displayed histrionic powers. His parents wisely resolved to cultivate these latent possibilities; they took him first to hear Sarah Siddons, then acting at Dublin; thereafter, they entrusted him to the Dublin manager, and he in turn handed him to his prompter, Hough, who saw in the boy a something which he thought would yet do credit to his instructor. He therefore set about training Betty, who made his début at Belfast in the year 1803. The boy was only twelve years of age yet he played the parts of Rollo, Douglas, Romeo, and Hamlet; and so popular did he become, that although it was the days of the United Irishmen, when it behoved every one in Belfast to be within doors by nine o'clock p.m., special permission was given to theatre-goers returning from Betty's performance.

From Belfast he crossed over to Scotland, and made his first appearance in Edinburgh. Jackson, his employer, left no plan untried to herald the youthful Roscius's fame. *Douglas* was the first play acted. Home, its author, was present, and declared he had never before seen it done so well. Glasgow received Betty with open arms; and so intense was the popular regard for him, that a journalist who ventured to criticise the 'Idol' had to flee the city.

Macready, father of the great William, engaged Betty for his theatre in Birmingham; the sum guaranteed was ten pounds per night, plus his benefits. When the youthful actor made himself known to Macready, the latter was so disappointed that he wished to cancel the engagement. Betty was agreeable, and only asked that his expenses to Edinburgh might be paid; however, Macready repented, and promised to remunerate according to the success of the venture. The engagement proved remunerative, for Betty received on an average sixty pounds per night.

The proprietors of Drury Lane wished to engage him, but they were of opinion that fifty pounds per night was an exorbitant demand, and so refused to employ him. What Drury Lane would not do, Covent Garden did, and the speculation proved a literal mine of wealth. During the summer, Betty visited the provinces; at Liverpool he cleared fifteen hundred and twenty pounds, and so great was the demand for seats, that crowds of all sexes might have been seen standing at the box-office at seven o'clock in the morning!

In the winter, he returned to London; and his popularity was greater than ever. The street in which Covent Garden Theatre stands was lined with soldiers; and so great was the crowd, that Drury Lane, from the overflow of its neighbourhood, drew three hundred pounds, and this in the afternoon. The play was one of *Voltaire's*, and Betty had to appear as Achmet, the boy-slave. Mrs Inchbald was one of the audience, and in her eyes the actor made a sorry appearance; indeed, she regarded the whole affair as the offspring of a popular whim. But her criticism stood for little, because was not the popular fancy tickled? Public taste is very erratic, for while Betty was drawing crowds, Kemble and Mrs Siddons, Cooke and Mrs Gordon, were acting to empty benches. But the 'feeling' had never on any other occasion run so high; Bonaparte was entirely forgotten; and the aristocracy vied with each other in having the company of the Irish boy. Pitt on one occasion moved the adjournment of the House of Commons in order that the members might see Betty act in a certain part. When the actor suddenly took ill, bulletins were issued at intervals; and after he reached the stage of convalescence, Charles James Fox read by his bedside.

Three nights a week he was at Covent Garden, and on the off-nights he acted in Drury Lane. For his first three appearances he received fifty pounds; and for the remaining five, one hundred pounds, besides benefits, each of which was worth one thousand pounds. The total receipts for the twenty-eight nights at Covent Garden amounted to seventeen thousand two hundred and ten pounds; the average nightly drawing was six

hundred and fourteen pounds; the largest ever reached was seven hundred and fifty-two.

The following autumn saw Betty again in London; but the spell was broken. Worth once more became an element in shaping public opinion; and it was needed. A picture of that period represents Kemble and Betty riding on the same horse; the latter, of course, is first, and the following words are put into his mouth: 'I don't mean to affront you; but when two persons ride on a horse, one must ride behind.' When the craze passed away, Kemble resumed his rightful place in the public mind. The provinces clung to Betty for a time; but they, too, tired of novelty. He was soon neglected; and in consequence he quitted the stage, and at the age of fifteen enrolled himself as a student at Cambridge with a view to the Church. But his first love was too strong, and he returned to the stage, continuing to act with indifferent success until his death at Southport in the year 1824.

The last of the quartette is Edmund Kean. The miseries he endured in the early part of his professional career seem almost too great for any man to have weathered. He married rashly, and the step did not lighten his sorrows. In the midst of such adverse circumstances, Kean always believed he was a born genius, and destined to receive the adulation of his fellows. His first engagement was at a theatre in Teignmouth, but the pittance he received was barely sufficient to procure for himself, wife, and child the necessaries of life. But while fulfilling this engagement, he attracted the attention of Dr Drury, who strongly recommended Kean to the proprietors of Drury Lane. One of their number was despatched to Teignmouth to witness Kean's acting and report upon the result. In consequence of this visit the ambitious actor was engaged for three years at nine pounds per week—a large sum for one who before could hardly keep starvation from his door. Kean repaired to London; but three months had to elapse before he could get into harness; during this time he had only eight pounds to keep himself and family. The privations they endured must have been terrible. For one hundred and thirty nights Drury Lane had been far below its average drawings, and the directors resolved to infuse new spirit into their company. They turned to Kean, and proposed that he should play the part of Richard III.; this Kean refused to do, saying, 'Shylock or nothing.' Expostulation was useless, and the directors submitted; success, they thought, was now hopeless.

On the 26th of January 1814 Kean made his first appearance at Drury Lane; for him it was an anxious time, for he was as yet an unknown man. His fellow-actors treated him with studied coolness, and until the morning of that eventful night no rehearsal was given him. When the rehearsal was finished, the general talk was regarding the certainty of Kean's failure, and even the manager, in petulant disgust, said it would never do. That day he resolved to dine! By some means his wife obtained for him steak and a pint of porter. To him this was indeed a feast. He felt conscious of his near triumph; and when he left home with a wig and a pair of black silk stockings in his hand, he said to his wife: 'My God, I shall go mad!' The

night was unfavourable, for the London streets were covered with two feet of snow. The play went on, and Kean displayed his great abilities. 'Hath not a Jew eyes?' was received with rounds of applause; and 'My principal!' was well rendered. But it was in the withering look of scorn with which he received the taunts of Gratiano that the audience saw the might of a genius. The motion of eye, lip, and muscle which Kean displayed had never been seen since the days of Garrick. And Fanny Kemble wrote that she would never forget his dying eyes in Richard III.

From that night Kean's triumph was complete. But his nature was very passionate; he could dine with Byron and the best of London society and thereafter be the chairman at a pugilistic supper. Excess told upon his frame; and when the time for bidding farewell to the stage came, he was unequal to it. He last acted as Othello to the Iago of his son Charles; and when he came to the words, 'Farewell! Othello's occupation's gone!' he sank back into his son's arms, saying, 'I am dying; speak to the audience for me.' So ended this brilliant career. Its noonday was very bright and fair; but the clouds of sunset hid the beauty we would have desired to see.

LION-HUNTING IN ALGERIA.

NORTH AFRICA, the seat of the once mighty empire of Carthage—the resting-place of the Vandals and cradle of the Moors—remains a *terra incognita* to the rank and file of the great army of modern travellers. Quaint notions still prevail as to the fauna of that vast expanse of country stretching northward from the Sahara to the shores of the Mediterranean. It is to most people a fabulous region, teeming with gigantic forms of animal life, where elephants and lions, the rhinoceros and giraffe, are believed to abound. But most of this is pure fiction, founded to some small extent on ancient history. In the remote past, elephants seem to have flourished in Morocco. Strabo describes them as existing there; but the fact nowadays is, that throughout all Tripoli, Tunis, Algeria, Morocco, and the great belt of desert on the south, no trace of wild elephants is to be found. The rhinoceros and giraffe are likewise conspicuous by their absence. Nevertheless, public opinion exacts from every African traveller a thrilling recital of the way in which these mighty denizens of the wilderness are laid low.

At the risk of being regarded as prosaic, we will be truthful and eschew all fiction. We have encountered no wild elephants; the giraffe and rhinoceros are strangers to us, beyond seeing them in captivity. The larger beasts of prey met by us with anything like frequency were only hyenas and jackals. The hyena, so called by the Greeks from its swine-like appearance, is that bristly-maned, dog-like animal frequently seen in menageries, of which we once heard the showman say: 'This is the savage hyena; he prowls about graveyards at night; he

digs up the corpses and eats them alive.' As to the jackal, he is but a wild gregarious sort of dog. When seen at menageries, half mad with hunger, or stirred up by the long pole of the keeper into fits of impotent ferocity, growling and snarling at you and at each other over the scanty meal of bones flung to them—these noxious creatures may have produced in some of us the pleasant sensation of being terrified in perfect safety. No doubt, many a visitor has come away from such shows firmly convinced that hyenas and jackals are animals of the most dangerous description; ugly customers to meet outside their iron cages. Such notions will be quickly dispelled by a holiday tour through Algeria. Moors or Arabs mind them no more than we do rats. Hyenas and jackals are to the aborigines of North Africa mere vermin, and, as such, not objects of fear, but only of loathing and contempt. No Kabyle would demean himself by stalking the like. His long gun, scimitar, or yataghan is much too good for them. They are fit only for his cudgel, and with it he slays them indiscriminately whenever they cross his path. In the eyes of the European sportsman they soon become more contemptible even than the rat, for it is a plucky animal, and will sometimes turn upon its foe and die game; but the jackal never. Even when wounded, or with their young, their only resource is to sneak away ignominiously. In short, master jackal is an arrant coward and humbug, known as such by every child in Algeria. Nor can it be said of the more powerful hyena that he is much braver. We have seen a mere lad with a stick chase them by day; and even at night, when they pluck up courage and come forth from their hiding-places in large numbers to ply their loathsome task as scavengers of the desert, an encounter with them is deemed by no means formidable. Only the most venturesome novice, freshly imported from Europe, would bring a breech-loader to bear upon them.

Where, then, in broad Algeria, may the brave son of Nimrod find game worthy of his trusted rifle and of his keen and practised eye, which have been the death of many a hare and wildfowl on the moors of merry England and Wales and bonnie Scotland? If he is *sans peur et sans reproche*, and, moreover, patient, much-enduring—and with plenty of time at his disposal—we can promise him the grandest and noblest sport of all. The king of beasts in his finest development is still to be found in North Africa. Among the mimosa bushes of yonder sandy plains he rears his majestic crest. Those rocky heights know his presence. From boulder to boulder he leaps with mighty bounds, and at night his awful voice re-echoes, rolling like thunder along the ground, and cowering all nature into silence. No other North African country contains so many lions as Algeria; but even there they are growing scarcer from year to year. Gérard, the first famous Algerian lion-killer, upwards of thirty years ago estimated them as only one hundred and twenty in number, and they have certainly not increased since. A successful lion-hunt has thus become one of the rarest of rare events. We have known many fashionable *chasses-au-lion* to be organised. No stranger of note who visits the country can well leave it without indulging in one or more of them. They are a picturesque but costly kind of

pageantry, always shown off in broad daylight, and forsooth on horseback. Small matter to these amateur sportsmen that lions habitually sleep by day in their almost inaccessible mountain fastnesses, and that the proximity of a large posse of men and horses intimidates them. The native guides know well what they are about. A lion-hunt has been ordered regardless of expense, and vast preparations are set on foot forthwith.

* At dawn of the appointed day, a glittering cavalcade issues from the gates. It is hailed by the acclamation of a motley crowd of natives eager for backsheesh, whose expectations are abundantly gratified, owing to the best of humours engendered by the prospect of such noble sport. A truly magnificent display is made of horses, harness, and picturesque costumes. Breech-loading rifles, revolvers, spears, and yataghans reflect the bright rays of the morning sun; and thus, with much shouting, clanking, and jingling, the grand hunt proceeds. Much show, but little wool, for nothing ever comes of it. All day long, through field, sandy plain, and forest, the king of beasts is sought, and never found. Some spicy little bit of excitement or other has been pre-arranged by the guides, who feel that something must be done for the money. A turbaned Arab suddenly appears on the outskirts of a thicket, vowing that a lion is there. With much show of courage, the thicket is entered by the guides, leading what seems a forlorn-hope; and the uninitiated follow boldly. Every bush is searched, but no! His royal majesty is not at home. His lair is indeed pointed out, and declared to be still warm with unmistakable signs of recent occupancy—but that is about all; unless some one in the fervour of his enthusiasm should fancy that he has got sight of the lion, of his tawny mane, his tufted tail, or glittering eyes. In that case, a rifle, perhaps several, are discharged; and though no carcass is ever found, the ready-witted natives are at no loss to account for that: it has tumbled into some inaccessible ravine, and there it lies. Lies, indeed! And so the grand hunt comes to an end before nightfall. A triumphal return; and sumptuous feast crown the glorious achievements of the day. In fact, the thing is a sham from beginning to end.

Real lion-hunts present widely different features. Free from all ostentatious display, they are spiced with much difficulty, exertion, and danger, and only on rare occasions unqualified success is reaped. Perhaps the most impressive of them is, when a whole tribe of Arabs in sheer self-defence issue forth to a man, determined to put an end to the ravagers of their flocks and herds or die in the attempt. It is indeed a question of life or death for the Arab. The amount of damage done to the herds of a tribe by a single family of lions in a month has been estimated at ten per cent., and remember, his herd is the Arab's all.

We were on a visit to one of the hill-tribes when such an emergency arose. Our hosts were poor, but to the best they could offer we were made heartily welcome. There is no lack of hospitality among the much-maligned Ishmaelites. Many an act of genuine kindness was shown us, and we should have been cravens indeed had we refused to aid our dusky friends in their hour of need. A lion family had taken up their abode in a cave difficult of access, among the hills close

by. Night after night dire havoc was wrought by these fierce marauders, and the time had come when a determined stand must be made to avert utter and irrevocable ruin. While the mountain Arab is by no means deficient in courage, perseverance, or physical strength, his weapons are of a most primitive kind. The long light flint-lock gun he handles bears no comparison with our modern arms of precision. Deprived of that comfortable sense of safety and self-assurance which the possession of a trusty breech-loader affords, the Arab endeavours to make up for it by an accumulation of numbers. It can scarcely be said, however, that the old proverb holds good on such occasions. Face to face with an angry North African lion, there is no safety in numbers; he has been known to rush upon hundreds of men.

A glorious morning it was among the hills; the sky all aglow with purple tints; and through the veil of mist which hung round the shoulder of the great granite heights far off, the summits were glistening like so many black diamonds bathed in sunbeams. Nature in its most rugged form lay before and around us. In the pure azure above, moon and stars were paling before the sun's return. We were surrounded by a motley crowd of Arabs in their picturesque costume. Young and old, all indeed capable of bearing arms had turned out; some few were handling their long, slender, smooth-bore guns, but by far the greater number had only spears and yataghans. The venerable chief beside us gave his orders briefly but distinctly. The exact location of the lion's cave was well known. At imminent peril of their lives, the scouts had found it, tracking its mighty denizens to their very lair. A large circle of spearmen was now formed, and the men received instructions to converge gradually towards a rocky ledge in front of the cave, whose entrance was faintly visible from the elevated position of our trysting-place. Presently the 'battue' commenced. Amid much shouting and clash of arms, the lines were drawn closer and closer, while all of us who had firearms made as straight as possible for the cave. Before we had got within range, an enormous male lion showed himself for an instant, shook his mane and vanished, to appear again when we had arrived at a distance of about a thousand yards.

A brisk but harmless fusilade was opened upon him by our Arab friends, and with a roar of defiance he withdrew once more into his stronghold; nor did he show himself again as we drew nearer and nearer, until we came to a halt about two hundred yards from the cave. The narrow ledge leading up to it was separated from the hillside on which we stood by a deep gorge more than forty feet wide. Above the ledge towered a precipitous height; and every cleft or gully in the rocky wall around bristled with the arms of our spearmen, barring escape in every direction, a complete circle of glittering steel. We looked carefully to our weapons, and, when all was ready for giving our royal foes a hot reception, loud shouts and clamour were raised to draw them forth; but all in vain. No lion showed as much as the tip of his nose. After brief consultation, one dauntless youth volunteered to creep along the ledge, close to the cave, collect a heap of dry brushwood and fire it, so as to smoke the lions out. The spearmen redoubled their clamour, and

we held our rifles in readiness for instant use, while anxiously watching the lad's progress. He pursued his perilous task with great courage. Creeping warily along the ledge, he never paused till he had gained the entrance of the cave. Quickly gathering together the dry brushwood near at hand, he soon raised a pile large enough to fill the entrance; and after firing it, he made his way back in safety, proud of his daring achievement, and warmly greeted by us all. A few moments and the fire blazed up, sending a column of smoke into the cave. The effect upon the inmates was instantaneous and startling. Two mighty roars mingled in one, and lion and lioness bounded forth one after the other. Our doings had goaded them into fury, and they were ready to do battle against all odds in defence of their young ones and their home. At first glimpses of them my companion and I fired; but the movements of the mighty beasts were so rapid and incessant that both of us missed. Our Arab friends were peppering away with their firelocks, but also to little or no purpose.

Suddenly, while the lioness charged down upon us along the ledge, her consort, with one mighty bound, cleared the gully, alighting in the very midst of the Arabs at its brink, and, for the moment, carrying all before him. We aimed carefully this time as the lioness sprang upon us, and both our bullets took effect; but it needed a second dose of lead out of our breech-loaders to stretch her lifeless at our feet. We then hastened to the assistance of our allies. What a scene met our eyes! Bleeding profusely from many wounds, but as yet far from disabled, the furious male was making sad havoc among the crowd. Cracking a skull there with one mighty sweep of his paw, and smashing a shoulder with another, he had already strewn the ground with slain and wounded, as we drew nigh to finish him with our rifles. At that very moment the spearmen were likewise upon him. While he was scattering his assailants in front, more and more men had drawn near from behind, and half-a-dozen lances were now plunged into him simultaneously, bearing him to the ground at last. The short but fierce struggle was over. Our terrible antagonist lay breathing his last, with his victims around him. He had killed five Arabs outright, and wounded fourteen more, among whom, to our great regret, was the young hero of the day, the same brave lad whose perilous exploit we had admired so much. A great broad gash from neck to shoulder will henceforth bear witness to his prowess in the eyes of the whole tribe.

We were publicly thanked by the chief for our modest share in the glory of the day, and he informed us later on that he deemed victory cheap at the price, considering that thirty or forty victims often fall in such encounters. Two young cubs, scarcely six months old, were found inside the cave half smothered by the smoke. We afterwards learnt that they had been sent to Algiers for sale, and, for all we know, they may now be inmates of some zoological garden or menagerie. Our work was accomplished. Probably for many years to come the tribe would be exempt from similar infliction. With high hearts we held our triumphal entry into the village, amid shouts of victory blended with death-wails, and with lamentations

over the many wounded. Our young hero of the fire met with his reward. They carried him along in triumph, and, as he lay on his roughly improvised couch, faint from loss of blood, but elated with the consciousness of his achievement, no mortal could have been happier than he. The whole tribe, young and old, paid grateful homage to him as he lay there, for 'honour to whom honour is due' remains the rule with these unsophisticated sons of the wilderness, and long may it continue so.

Such, then, has been our experience of lion-hunting in North Africa. Furnished with the best arms of precision, and well supported by the indomitable pluck and ripe experience of our dusky allies, we had found ourselves face to face with the king of beasts, and, after all, had but little right to boast of our encounter with him.

AN ATLANTIC EXPERIENCE.

A wild night in mid-Atlantic, with a gale of wind, and the old *Octavia* staggering along before it, with her lower topsails and reefed foresail set. Now, slowly climbing up the hill, then a slight pause on the crest before she dived down into the dark abyss between the waves, and every now and again a great sea would catch her under the quarter, making her old timbers creak and groan as if they were in agony. Two hands at the wheel grinding away, hard up and hard down, trying to keep the old tub as straight as possible. Sometimes she would come up and a green sea would dash over the weather rail and across to leeward, making the deck-load strain and tug at its lashings as if it longed to get loose and join the foam-capped waves in their mad gambols.

It was the month of July, and the barque *Octavia*, from Quebec to Sunderland with timber, was reaping the full benefit of a westerly gale, which had sprung up the night before. There are much more comfortable places than the deck of a timber droguer in bad weather, and such was the opinion of the watch on deck, who were clustered round the windmill pump, just under the break of the poop, earnestly wishing for eight bells, when they would divest themselves of dripping oilskins and big sea-boots and enjoy the comforts of a dry fo'c'sle.

Just after a heavier sea than usual had broken over us, which made us hang on like grim death to the life-lines which were rigged across the deck, the second-mate sang out: 'Way along here, lads, and get a lashing on these bonts;' and we tumbled aft, growling as only sailors can. We carried three—one the gig in the davits on the port quarter; the two others on top of the deckhouse forward. We commenced putting the extra lashings on the quarter-boat first, and an awkward job it was, holding on with one hand, and passing the rope round the boat with the other, while the ship rolled about and staggered like a drunken man, which made it difficult for the best sailor to keep his feet, while every now and then a blinding spray would dash up into our faces and fly all over the poop, covering us all with sparkling drops of salt water, that glittered like diamonds whenever the sun, with a struggle, peeped through the heavy clouds that were lying over the skies. We finished the job, however,

without any mishap, except that Magnus the Shetlander dived head foremost into the dog-kennel, to the intense disgust of Flora, the big Newfoundland.

Having securely lashed the after-bout, we made our way forward to do the same to the others, accompanied by Flora, who never seemed to think a piece of work properly done unless executed under her own superintendence. We had got into the waist, when a warning shout of 'Look out there, boys!' from the wheel made us look up, to see a huge sea just rising on the weather-side and threatening to overwhelm us. A tremendous rush for the fore-rigging ensued, ropes and handspikes being dropped and abandoned to their fate. I, being a young sailor at the time, and not fully aware of the enormous power of an Atlantic wave, sprang on top of the hencoop just abaft the house. I had scarcely got up, when, with an awful crash, the sea broke over us, and I was swept away to leeward amidst the wreck of the hencoop, covered with water, and all aloft. I thought I was overboard, and remembered that we had just lashed the only boat that could have been lowered, although no boat could have lived in such a sea. The next thing I felt was something holding me by the legs; and when the water cleared away, I found myself half over the side, but my legs jammed by the last log of the deck cargo, which had got loose, the wedges being washed out, and the lee bulwark cut off by the deck. Waiting for the next weather-roll, I scrambled up as best I could, and made my way to the fore-rigging, in which the second-mate and the rest of the watch on deck had taken refuge. I was helped up by the men, who were very much surprised to see me, every one thinking I had been swept overboard, like poor Flora, who was seen struggling in the waves astern.

The old barque had broached-to just as the sea toppled, and her decks were left in a complete state of wreck, the deck cargo loose, and knocking about with every roll. The hencoop on which I had climbed had been carried overboard. The boats on top of the house had saved us the trouble of putting extra lashings on by disappearing altogether except a few splinters on the lee-side of the house. The lee bulwarks had been carried away, and the weather-side of the deckhouse stove in. The *Octavia*, as usual in timber ships, had no fore-castle in the bows, and the crew lived in the forward end of the deckhouse. The whole of the watch below had been washed out of their bunks, and were flying about the deck in their shirts, half awake, and adding not a little to the general confusion. The rest of the crew immediately set to work to put things to rights; while I, feeling my legs very painful, made my way to the galley, where the cook was at his wits' end, having lost all his pots and pans except one large kettle, which had been washed into the coal locker and escaped the fate of the others. In a few hours we were all to rights again, the cargo wedged off, a spare topsail nailed over the side of the house, and a life-line rigged along the lee gunwale. I was laid up for a day or two, as my legs were much bruised and swollen, but I was soon able to be about again. I have been in several scrapes at sea since that time; but I have never forgotten my first narrow escape from drowning.

GRANDMOTHER'S VALENTINE.

• St VALENTINE'S DAY dawned bright and fair,
And 'twas nine by the great hall clock
When we gathered about dear Granny's chair,
Awaiting the postman's knock.
• It came at last with a rat-tat-tat
That resounded through the place,
And startled Grandmother where she sat
With a smile on her fair old face.

Then eager hands were outstretched to take
The missives that youth holds dear,
And her silver head gave a warning shake,
As she heard the laughter clear
That rose and fell, and broke out anew
'Mid questions of 'yours' and 'mine,'
Till one cried: 'Granny, a letter for you—
It must be a Valentine!'

Grandmother, knowing her young folks well,
Suspected some girlish plot,
But opened her letter, and from it fell
A spray of forget-me-not—
A slender spray, which had once been blue
As the tints of the summer sky,
But was faded now, and of palest hue,
Like a relic of days gone by.

Our eyes grew dim with a sudden mist
That melted in tender showers,
When our youngest and dearest stooped and kissed
The hand that fondled the flowers.
Grandmother smiled; but we saw the tears
On her soft gray lashes shine,
As she said: 'Nay, do not trouble, dears;
'Tis a precious Valentine.

'Some gentle fingers gathered this spray,
Under last summer's skies,
From a grave in a churchyard far away
Where my heart's best treasure lies.
It has been carefully pressed, you see,
And kept through the winter hours,
Then sent like a message of love to me,
'This delicate spray of flowers.'

But Grandmother spent that day alone;
And we guessed the tender truth,
That the grave where the little flowers had grown
Held the husband of her youth.
For when we bade her a fond good-night,
With pathos that seemed divine
She laid 'neath the folds of her pillow white
That strange, sweet Valentine.

Ah well! She died when the spring was new,
And we laid her down to rest
Where fragile blossoms of tender blue
Would nestle above her breast:
But we knew her love had lived through grief,
In Memory's greenest spot,
When we found on her Bible's well-worn leaf
That spray of forget-me-not!

PRICE 1½d.

IN THE SUNNY SOUTH.

THERE was never a blue so dreamy as that sea at first sight from the hills. A patch of yellow corn made a clear edge; beyond its softly rounded line one saw the blue gap of the bay, the vision of the southern sea. It might have been close below; it might have been deep as the cliff in *King Lear*. All sense of depth was lost; only the smoothness told that the dreamy surface was very far below. Placid, mysterious, it faded away into the round bright distance.

One pities holiday travellers who cannot enjoy these things. 'The vision and the faculty divine'—the eyes to see and the heart that knows what to rejoice at—are better than a long purse of gold to the summer traveller. The question is not how far we can go, but how much we can appreciate.

On the Rhine steamers, one meets with a type of tourist who reads the guide-book while the realities are drifting past. The same sort of sightseer 'does' London, and stands before the great Raphael with his whole soul filled with wonder—not at the picture, but at the fact that such a matter of saints and paint could have cost the nation seventy thousand pounds. There is no more cultured observation in the man than in a pumpkin, and no emotion except at the sight of his hotel bill.

Another mistaken type of holiday-maker is the discontented one; he does not find anything to enjoy, but everything to grumble over. Of this class are the distressing folks who come home fagged with a dreary report: 'Never was in such a miserable place! No shops; no promenade; stones to walk on; nothing but the sea, and of course that is always the same, so there is not even anything to look at!' Truly, a barren picture. Let them take heart anew, and wander away to the Sunny South.

Down in that bright region the sea changes colour many times a day. All the popular names of its colouring are failures, when it is before one's eyes. This is not the sea we have heard

about as being glassy, or blue, or green, or azure, or leaden, or silvery. It is not glass; there is the appearance of depth, and its best stillness is infinite movement. If it be true to call it blue, the colour is a dream-blue, that belongs to no other thing in heaven or earth. If it be green, it is a hue that we never connect with the abstract word—a gray-glass green with a liquid quality of its own. If it be azure, it is not the plain reflection of the sky, but a most mysterious shadow of it. When it is leaden, there is no sense of weight, but confusion of movement; and, lastly, when the broad ocean-paths are called silvery, one forgets that the silver is made of living light.

There are some English watering-places where the parading crowds appear in different toilettes three or four times a day. It is no wonder that the great sea refuses to show its majestic colours to small folk so taken up with themselves. For the multitude who strive to outline each other, the sea has no changes except from rough to smooth; but for those who have eyes and ears for greater things, it has a welcome like the face of a friend, and its voice is an eternal greeting. Come away to the Sunny South, and watch whether it is 'nothing but the sea, and always the same.'

Its morning light is that living silver, with vast cloud-shadows travelling over it. The clouds gather, and along the shore it is liquid lead—or so it may be said to be, in the poverty of human words. Look later at its face when the thunder-clouds have passed. Along the south they lie like a purple shroud, with here and there a pile of fiery cloud-light. In the darkest depth is the fragment of a rainbow. Under this pageant, ghostly ships stand poised on a still surface of gray melting into dreamy blue, blue into purple under the purple of the, far-off storm-clouds, and purple again dissolving into brightness where those fiery towers ascend the sky.

Or call to mind what is roughly classed as green water, and examine it near. The rollers on a clear morning lift a dusky glass-green edge

full of bits of red and brown weed running upward. There is one moment of transparency against the light; then with a crash the wave falls over along the whole length, with white spray and infinite rushing of foam fountains. The shingle rattles like a giant's pebble store as it runs back while the next wave is rolling in.

Night comes; and the buffeting roar alternates with the rush of shingle. Black under the stars lies a vast space of darkness and mystery. The warning lights of a far-off shore, revolving patiently, flash like stars out of the sea. Faint glimmers vanishing mark the track of ships—the homeward course, now nearly done at last; or the outward way to the pathless oceans, to the wide, wide world. Lonely wanderers on the deep, their faint far lights are sparks of heroism in the night. By day one may see from the hills 'a painted ship upon a painted ocean;' but those slow meteors by night have somehow deeper meaning; they send back a message of the long leagues traversed, or remind us of the lights that go off into the darkness and never come back.

Then comes the day, dazzling with every ripple, and waning to afternoon, when the sea spreads to its far circle mysteriously, in that dream-blue that we saw above the corn.

The shore of this southern land is as wonderful as its ever-changing sea. The summer tourist abroad enters vast cathedrals, those medieval miracles of stone; perhaps their counterpart in nature is to be found in the German pine forests. In turn, he visits also castle and fortress, the strongest human strength could build against the tide of war centuries ago; their counterpart in nature must be the bastions of the shore against the waves.

Now the coast in this corner of the Sunny South is built right nobly. Tower beyond tower it guards the land for many a mile; tower beyond tower, not piled or embattled, but level as a wall at the top, and from sheer height impregnable. Gigantic buttresses strengthen their base. Grass and samphire streak their grayish whiteness. Seabirds circle round them by day; the magnificence of the stars looks down upon them by night; and when the moon steals out from above the topmost ridge of those cliff fortifications, all the vast wall whitens, and, like the poet's abbey, buttress and buttress alternately are carved of ebony and ivory.

Ascending by zigzags from the bay, the naturalist may find on the green top of these ramparts a bewildering wealth of flowers haunted by rarest butterflies. The student of things human sees the valleys with their yellow rivers of harvest, or the green and brown squares of cultured hill-side; the wayside fields full of sheaves; the village labyrinth; the thatched barns and red roofs; and he finds himself in the midst of a peasantry where cottage comfort is the rule, and rags and poverty are unknown.

Hark to the horn! The carrier's cart is going—a stagecoach on a small scale; and we can ride inside or out, and feel what travelling was fifty years ago. Before mounting, let us step into the post-office, where the half-dozen letters are being sorted in the cottage back-parlour, and the post-girl waits with her satchel. We are off with the twanging of the horn. The driver belongs to the good old school—a fine young fellow, who

loves his horses and his work. He is no city toiler, whose life is a business of struggle and pay, but a son of the pure country, the rejoicing descendant of a long line of carriers who have done honour to the family trade. In the Norman church there is a stained window to his grandfather's memory, all ablaze with glorious colour, simply because 'he was a good man,' who in every sense of the word drove honestly by the straight road. In his case, certainly, the path of duty was the way to glory, as the Laureate sings so truly.

We whirl along past the unhedged fields, by roads that are mere horsepaths, with an open French appearance. Then come tangled hedges dashed with the scarlet berries of the 'wayfaring tree.' Our driver fairly pets his horses with the wrong end of his whip; and, like Barkis, he is 'willin'—to tell us all about them. They know Sunday, those intelligent animals, and are found lying on their straw beds, conscious that for the carrier's horses it is the morning of rest. Possibly the church bells tell them, or they may have a way of counting like Robinson Crusoe, for anything we know. After the hardest journey, the best one will prance when he is let loose, and want to play with his master like a dog. Would that the town horses knew these things—ay, and the town drivers!

After long journeying, here we are arrived among seaport streets. We dive into a curiosity-shop to get some souvenir. 'Thirty pound I was offered for them two little bronze horses,' says the shrewd trader; 'but no less than seventy is the price, for there's not the like of them in Europe. Four hundred year old, if they are a day; and brought over from the siege of Paris.' (One of them is Napoleon on horseback.) 'Four hundred year old!' After this shock, we beat a retreat, sighing that even here man is but human, and the tourist is his victim. So we get back in haste to the cliffs and the stars, the harvest-fields and the happy village, the bright shore, and the ever-changing sea.

Where is that shore, and where that sea? Why, it is no farther south than our own southern coast. The pageant of land and water, the banquet of delights, was in the very same Kentish corner where the unobservant folks found 'a miserable place with nothing but the sea and stones.' So, when we go for a holiday, let us take, not only our luggage, but our eyes and our hearts.

JOHN VALE'S GUARDIAN.

CHAPTER IX.

THERE might have been a certain elation of spirit produced by running away from home under other circumstances; but John was so dull that he seemed only half to realise what he was doing, and Will was so sore with yesterday's handlings that walking was difficult to him. John's spirits could fall but little lower, and Will had his inward fires to keep him going; but they were both solemn and silent.

'I'm beastly hungry, Will,' said John, when they had travelled some two miles. They had struck into the great southern road which led Londonwards, and Will was bent on pressing

nward, for the road was dangerous for the
ext three or four miles. Any moment might
ring a passer-by who would recognise them,
nd set pursuit upon the track.

'All right,' Will answered; 'you shall have
something directly.'

They sighted by-and-by a little wayside house
where the legend 'Ginger beer sold here' was
rafered to the window-panes; and a half-dozen
ilious-looking buns of suspicious yellowness were
xposed with a few nuts, a wooden measure
with a body of unnecessary density, and some
bottles of acidulated drops, which in long neglect
nd solitude had learned to stick to each other.
here was a picture in the window, where
eople with lettered bladders floating from their
ps were supposed to express the highest admira-
on for the qualities of the ginger beer. One
gentleman held a bottle in both hands with a
ream of the inspiring liquid bursting from it;
nd another gentleman balanced the escaped
ork at the extreme tip of his nose; and all
e other gentlemen and several ladies lifted
eir hands and looked supremely unaware of
everything.

The boys entered the shop, and an old woman
a spectacles and pattens came clattering out of
he kitchen behind it.

'Now, then,' said the old woman, as if their
ntrance there were an aggression and she resented
bitterly, 'what do you want?'

'How much are those buns?' Will asked,
nstituting himself spokesman.

'They're a penny apiece,' said the old woman.
Very cheap and light and wholesome.'

'There're very stale, by the look of 'em,' the
oy answered. 'I'll give you twopence for
ree.'

'They're a deal more wholesome than if they
ere new,' said the old woman. 'You shall have
ree for twopence-ha'penny, deary.'

'Twopence,' said Master Gregg stolidly. 'I've
ot to make my money go as far as I can.'
here was something so aged and severe in this,
at the old woman capitulated at once, and set
e buns upon the counter, where they sounded
ke *plaques* of wood.

'How much is the ginger beer a bottle?'

'A penny a bottle, my dear, and very brisk
nd strong.'

He ordered two bottles; and the old lady having
ound two heavy tumblers, opened the ginger
eer, which concealed its fiery properties with
reat meekness. It had a faintly milky hue,
nd drank like rain-water very faintly spiced
nd sweetened. The yellow buns, in spite of
eir rich appearance, were dry and sawdusty;
ut the boys despatched them somehow, and
rent their way, with hunger and thirst appeased
or the time being. But this first drain upon
is resources set Master Gregg thinking. Four-
ence a meal was not an extravagant price to
ay; but fourpence a meal meant a shilling a
ay, and at that rate he could last for five
ays only. Running away from home was all
ry well in its way; but the three diurnal
eals were something, after all. Yet he was
unning away from bitter injustice and cruelty,
s well as from home, and he had made himself
sponsible for John, and had promised that
obody should hurt him any more. He would

keep his promise. Somehow, John should have
enough to eat, and he would find and keep a
shelter for him. A shelter? There was another
consideration. What would it cost to get a bed?
His financial possessions began to look woefully
small.

Whatever other thoughts he had, he had no
dream of turning back again. Let the future
look as black as it might, he walked towards
it, and when he thought of his companion, pity
and justice stirred his heart and lent him new
courage. The great majority of people are con-
tent to think of boys as if they were creatures
who will come alive one of these days, and begin
to think and feel at some undefined epoch of
existence. But the boy is alive already, and is
thinking and feeling with an intensity to which
the average man is a stranger. He has so much
and so many things to learn, that he is sure
to forget with great rapidity, and so he seems
inconsequent and fickle. He is a great deal
better than the adult as a rule—more honest, more
affectionate, more in earnest, more loyal, than
he will ever be again. A man throwing up every
chance in life to defend a trampled friend would
be an heroic figure. A boy doing the same thing
looks only rebellious and thoughtless. I warn
the reader of this chronicle that I am going
to treat this exodus from the land of injustice
and oppression *au grand sérieux*.

The two wayfarers struck the great town in
something like an hour and a half from the
beginning of their journey, and in another hour
had walked through it and come upon the country
once more. Master Gregg began to feel easier in
his mind with respect to the chances of pursuit,
and had ceased to look behind him whenever
a vehicle of any sort made itself audible in
the rear. The day was pleasant enough, dry,
and bright with a spring-tide brightness. The
first signs of spring-tide life were gay in the
hedgerows, and the birds were busy, and made
the fields vocal with their pipings. The sun
shone, though not too warmly, and there was
a merry vagrant wind abroad.

'Will,' said John, putting an arm through
his companion's, 'where are we going?'

'We'll go to London, Jack,' said Master Gregg
with more cheerfulness than his thoughts war-
ranted.—'There's a bell ringing. D'ye hear it?
What does it say, Jack?'

They stood still to listen, and a bell rang
in the distant town.

'Turn again, Whittington,' John suggested.

'No,' said Master Gregg; 'whatever else it says,
it doesn't say that. "Go along both of you,"
perhaps. It must be ten o'clock by this time.
You'd have had a hiding before now, if you'd
gone to school, Jack. Old Macfarlane promised
you one, didn't he? He doesn't often forget
his promises, old Macfarlane doesn't.'

'I'm very glad I came,' John answered wist-
fully after a little pause.

'That's right,' said the protector.—'I say, Jack,
now you're with me, and haven't got anything
to be afraid of, nor anybody to bullyrag you,
you'll get brighter every day. Won't you?
You ain't so bright as you used to be, are you,
Jack?'

'No,' said Jack submissively; 'I'm not bright
a bit. Do you think I shall ever be?'

'I should think I did and all. It's only Uncle Bob and old Macfarlane. Don't you mind, Jack. You'll never see them any more. We'll get something to do in London. I wonder what we shall have to be? London's a port like Liverpool. We might go to sea, and be cabin boys. That would be jolly, wouldn't it? But then they wouldn't wait two in the same ship, and that wouldn't do, unless you went as a stowaway. I could hear you tap when we were three days out, so that that would be all right, wouldn't it?'

Before John could reply to this, a tall trap rattled by, and pulled up in a cloud of April dust; and there in the trap sat Isaiah, staring backwards with a face of wooden astonishment.

'Hillo!' said Isaiah. 'What brings you two here?'

Master Gregg's first natural thought was that Isaiah had been despatched in pursuit, and his question hardly served to dissipate it.

'Where are you going to?' asked Isaiah. 'What brings you so far away from home, the pair of you?—It's my belief,' he added aloud, but with an inward tone, 'that they're running away, the pair of 'em.'

'So we are,' said William doggedly.

'You are, are you?' cried Isaiah. 'That's pretty cool, that is. And where do you suppose you're going to, the pair of you? And what do you suppose you're going to do when you get there?'

To this neither of the fugitives returned an answer. John looked timidly at his companion, as if appealing to him for support, and Master Gregg looked sullen defiance at Isaiah, but said nothing.

'Look here, you know,' said Isaiah, climbing out of the trap and throwing the reins over his arm. 'This won't work a bit, this won't. It won't act at all. I've no authority over you, you know; but I must take Master John back with me; that's what I've got to do.—Come along, Master John. Get into the trap.'

'We're not going back any more, either of us,' said the captain of the expedition, gathering stoutness. 'And if father and old Snelling and old Macfarlane took us back, we should run away again.'

'Oh!' returned Isaiah. 'That's settled, is it? Now, to begin with, what are you running away from? And—to go on with—what are you running to? What are you running away from, for a start?'

'Old Macfarlane flicks him every day,' said the boy hotly. 'He can't do his lessons, and it's no use pretending that he can. And old Macfarlane licks him because he can't do them; and he licks me because I won't let him lick Jack.'

'Oh!' said Isaiah again. It was an odd-sounding slow exclamation, and seemed as if it had something friendly and understanding in it. If even the faintest flicker of smile had gone with it, it might have been reassuring. 'You won't let him lick Jack, won't you? And how do you hinder that, young master?'

'I didn't let him yesterday, anyway,' the young master answered.—'Did I, Jack?'

'No,' said Jack gratefully. Isaiah looked from one to the other, and scratched his whiskerless cheek, with a wooden distortion of his face, but said nothing.

The bulldog boy went on with a sudden intense earnestness: 'You don't know what it's all about. I've heard my father say that if Jack doesn't get better, old Snelling will have the handling of his money; and it's my belief he don't want him to get better, and he pays old Macfarlane to bullyrag him, and keep him like he is, and make him worse.'

'Well, upon my sayso!' said Isaiah. 'You're abeginning to take away your elders' characters pretty early in life, you are! That's a very pretty idea to have hit on at your time of life.'

'Don't take me back, Isaiah,' John besought him feebly.

'Don't you be afraid, Jack,' cried his champion; 'nobody'll take you back again.'

'This is all rubbish, this is,' said Isaiah. 'You can't be let go wander all over the country like a pair o' babes in the wood.—Have you got any money?—William nodded.—'How much?'

'Four-and-eightpence. I don't know whether Jack's got anything.' Jack, it appeared upon investigation, had threepence-halfpenny. 'I shall get something to do; I shan't let Jack want for anything.'

'You're a good plucked un, you are,' said Isaiah with the same unmoved visage. 'But it won't act, you know. You've got to go home again; that's what you've got to do, you know.'

Neither of the boys made any answer to this statement; and Isaiah, scratching his cheek and making hideous faces, looked at them in turn. He had felt it necessary to protest against the dreadful accusation young Gregg had hurled at his employer; but he was not so sure as he would have liked to feel that there was not a touch of truth in it. The boy himself, of course, had no idea of its full enormity. A responsible accuser would have hesitated, because he would have understood. The irresponsible boy-mind went straight to the mark simply because it could not understand the appalling nature of the truth. The more Isaiah looked at the ghastly suggestion, the more he was inclined to give it credence. It was horrible; but it was like Snelling, somehow.

'Look here!' he said after a while. 'I can't afford to stop a-illing and a-trifling here. If you young gentlemen'll get into my trap, I gives you my word—honour bright, mind you!—that I'll let you down again, and won't try to stop you, and won't try to take you back, and won't tell on you. But we'll talk it over while we go, and we'll see what is to be done. If you makes up your minds to go back, I'll take you back; and if you makes up your minds to go on, why, we must think of somewheres for you to go to. I can give you a six-mile lift, anyway.'

'Honour bright?' asked William, and Isaiah answering, 'Honour bright!' the two boys climbed into the trap and were driven onwards.

'Now, tell us all about it,' said Isaiah; 'tell us what started you. Let's see where we are.'

In response to this invitation, William told the story of yesterday's conflict and its results in his own mind. Isaiah made him take off his coat and waistcoat in a lonely part of the road, and himself unloosed the boy's neckerchief, and undid the collar and wristbands of his shirt, to seek ocular demonstration of the truth of the tale.

'Put 'em on again,' he said brusquely, after a mere glance at the lad's arms and shoulders—

put 'em on again. Was it Macfarlane worked your face 't that way too? Um!

After this, he stared straight before him in silence, occasionally clenching his fist and drawing his right arm back with a threatening gesture. He accompanied this gesture with a grunt of angry scorn, and was probably having it out with the schoolmaster in his own mind.

'Had any breakfast?' he asked suddenly, and being answered, grunted: 'Buns and ginger beer! What's buns and ginger beer? Can't live on buns and ginger beer. Buns and ginger beer, indeed!'

He pulled up at a wayside inn, and ordered eggs, bread and butter, and coffee, which the wanderers consumed with a relish, though they had still some mistrust of Isaiah's ultimate intentions. He in the meantime smoked a contemplative pipe, and drank a mug of ale standing at the kitchen fireplace, and scratching his bald head in an occasional frenzy whenever either of the boys looked at him.

When they had finished their meal, he paid and drove on again; and when they were a good twelve miles from his employer's house, he pulled up suddenly and announced that he had made up his mind. 'You see that lane?' he said, indicating a grass-grown thoroughfare to the right. 'You go down that lane for about two mile, or maybe two mile and a half, and you'll come to a village with a church in it. When you come to the church, you'll see a shop, shop opposite, a little shop, a greengrocer's. You ask there or Mrs Winter—that's my mother, and tell her Isaiah sent you. She'll take care of you, and I'll come over and see you on Saturday night. Out you get! It's more than my place is worth to be seen with you. I'll make it right for you to home; and there's half-a-crown apiece for you.'

'No, thank you,' said Master Gregg, taking up from John's unyielding palm the coin Isaiah had already thrust into it. 'We shan't go there. You're very kind, Isaiah; but you can't make it up at home, and you can't keep old Macfarlane from licking John. They don't want him to get right again, and they won't let him if he goes back to em.'

'Burn my taters!' cried Isaiah in a high state of exasperation, 'I don't know what to do. You'll have to go home again; that's what you'll have to do, you know. Why, it's madness, letting two idle like you wander off into the wide, wide world. It can't be done, you know.'

'You promised you wouldn't try to stop us,' said William. 'You said, "Honour bright,"—' Isaiah half groaned, half grunted an assent.—'I shall never let John come to any harm.'

'What's the use of talkin'?' cried Isaiah. 'How an you keep him from harm?'

'I shall find some work to do,' replied William stoutly; 'and I shall do it.'

'Well, now,' said Isaiah, 'will you do this? Will you promise me, you'll buy an envelope and a queen's-head at the very first bookseller's shop you come to? Will you write on it Isaiah Winter, Post Office, Castle-Barfield? And will you send it to me if you get into any sort of trouble?'

'If you'll promise not to tell where we are.'

'Yes; I'll promise that,' said Isaiah, scratching

so savagely at his baldness that he tilted his hat into the roadway. John gravely handed it up to him, and he slammed it on with an air of utter desperation.—'Mind you, if ever you're caught, you don't say a word about having seen me. That's a bargain!'

'That's a bargain, Isaiah; and thank you very much.'

'Well, there's five shilling apiece for you, and the Lord help you!' said Isaiah. He threw four half-crown pieces into the dusty road and drove away without a backward glance.

'You're a man, you are,' he told himself; 'you're a pretty creature to set up to live outside of a lunatic asylum, ain't you, letting two innocents like them go tramping about the world?' He stared forlornly forward, and then responded angrily, as if the reproach had been addressed to him by some unjust and stupid person: 'What was a cove to do, Isaiah? Come now; what was a cove to do? Take 'em back again? Take him back?' he grunted in profound derision. 'As if anybody but a fool would ha' let 'em go like that.—Well, I can't help it. They'll precious soon get through what bit they've got, with their buns and ginger beer, and such-like notions of living, and then they'll write. They won't go far. They'll be all right; and if anybody had told me as Isaiah Winter was such a fool as he's turned out to be, I'd ha' knocked his head off his shoulders.'

(To be continued.)

THE 'DRUMMER' OF THE FAR WEST.

From my title your readers may imagine that I am going to write about performers on the bass or side drum; but I am not. To be a 'drummer' out here, no musical education is necessary, because, instead of playing with two sticks on the head of one of those instruments, the gentlemen who follow the occupation have to be able to play a most lively tune on the minds of the retail merchants throughout the country. In other words, a drummer is a commercial traveller, or, as he is often called, a 'knight of the grip,' because in his travels he is always accompanied by one or more grip-sacks, the American name for a valise or Gladstone bag. But between the English commercial traveller and the American drummer there is a wide gulf. In all respects the drummer belongs to the New World; and while you may meet commercial travellers in every country in the world, yet in America, and America only, do you find the drummer. The name is appropriate, too; for the competition in all branches of trade in the United States is so strong that it takes drumming indeed, and the ability to play a most popular tune of low prices and fine quality for the drummer to succeed.

Your commercial travellers in the Old World have a path of roses to walk in compared with the drummer in the Far West. Here he must be possessed of the patience of Job, the perseverance of the spider, the cunning of the fox, and the digestion of the ostrich, to say nothing of powers of endurance and uniformity of temper. He must have three subjects uppermost in his mind all the time, and never lose sight of

them for a moment: himself, his employer, and his customer. I place them in this position because in America, of all other places, you must look out for yourself first. I know it reads like a selfish creed, but it is none the less true, and to the drummer more essential, I think, than in other walks of life. He meets with but little sympathy usually either from his employers or customers. Employers in the United States, unlike those in the Old World, very rarely, if ever, pension an employee, the usual course of procedure being, when a man has passed beyond the age of usefulness, to replace him with another and younger man. Of course there are exceptions to this rule, but they are very few and far between.

Then his customers rarely appreciate the efforts of the drummer in his endeavour to please them by giving the best prices, finest qualities, and liberal discounts, but are all the time anxiously looking for some other who will give them a little better terms; and when he is found, as too often he is in this country of strong competition, they transfer their trade without a single thought as to the consequences to the man who has looked out for their interests maybe for years.

But as I do not wish to tire your readers with a homily on the relations between the drummer, his employer and customer, I will proceed to give a description of the more interesting features of his life on the road, and of his pleasures and trials.

That old chorus, 'For we're a crew of jolly dogs,' &c., is specially applicable to the drummer, who has always on hand a stock of funny stories with which to interest his customer. Indeed, to be successful, you must always be jolly. No matter what happens, you must meet your acquaintances with a smile, and be 'hail fellow, well met' with all. An old story is told of a wholesale merchant who had never had any experience on the road, but who thought he knew all about the life. A young drummer had just returned from his first trip, and the smallness of his sales had aroused his employer's anger, when the following dialogue ensued:

Employer. Now, Mr Blank, let me give you a few hints as to how to sell goods. Let us suppose you are the salesman, and I the country customer. Let me see how you perform the part for which I am paying you. (With that the employer stands up, ready to meet his supposed unknown visitor, who approaches him with a confident smile on his features.)

Drummer. Good-morning, sir; allow me (presenting his card) to introduce myself, the representative of Dash & Co., the great dry-goods house.—I have a very fine line of samples, which I hope you will allow me to show you.

Employer. Certainly, certainly. I am delighted to meet the representative of such a well-known firm. I shall be most happy to inspect your samples, and hope to buy a good bill of your stock.

Drummer. You think that's the way we are treated—do you, sir? Well, let us change places, and I will undeceive you, and give you a sample of the welcome we receive from a majority of our customers. Now, sir, I will represent the country dealer; you, the drummer.—(With these words he settled himself in his employer's chair, placed

his feet on the rosewood desk, and commenced to chew plug tobacco vigorously.)

Employer. Good-morning, sir, I represent—

• *Drummer.* Oh, you do! You are about the twentieth drummer that has been pestering me this morning.—I am stocked up fully in every line.—Now, take No for answer at once, and don't bother me any more, for I want to read my paper. I intend to buy a bull-dog, a spring-gun, and a man-trap, and see if I can't keep you nuisances out of here.—Good-morning.—(And without paying any attention to the look of astonishment on his employer's features, he quietly picked up a paper.)

To say the old gentleman was astonished is a mild way of putting it; but as soon as he found his voice, he at once apologised to the drummer for his fault-finding.

Of course, this is an exaggeration of the actual treatment the drummer receives; but in reality he often finds his country customers very sour, crabbed, and unapproachable. But such receptions must not ruffle his temper; he must smile cordially, and proceed to captivate the boorish dealer, and often succeeds so well as to sell him a good bill of goods. The drummer must have a full repertoire of comical characters to mimic, and the better the mimicry, the more successful is the drummer usually in gaining the good-will of the retail dealer. He must arise from his bed at any and all hours of the night, no matter how cold or stormy, in order to catch a freight-train or the regular passenger. He must be able to eat a meal in fifteen minutes at the eating stations along the line of the road, no matter how tough the meat may be, or how hot the coffee and soup; otherwise, the train will pull out of the station, and he will be left with the pleasant recollection that the representative of a competing house will reach the next town first and maybe take up all his customers. He must be ready to jump from a train as it enters the station, walk half a mile, sell a bill of goods, and reach the station again in time to take his seat before the train pulls out, and accomplish this feat while the engine is taking coal and water.

In the wintry blizzard he is often snowed-up, sometimes being caught between two stations without a house in sight, with the thermometer away below zero, and the wind blowing the snow against the railroad car at the rate of fifty miles an hour. Here he may have to stay for hours without any food; and when his hunger compels him to seek the shelter of the nearest farmhouse, he wanders out into the storm, and runs a great risk of being found frozen to death at the bottom of a snowdrift when the summer's sun shall have melted the snow.

His experiences in the country hotels, sleeping in damp and often dirty sheets with his head resting on pillows apparently stuffed with brick-bats, can be described, but must be felt to be thoroughly appreciated. The fare, too, is often of a nature not the most appetising to a weak stomach. Every dish will taste alike, a greasy flavour predominating. The butter often is strong enough to walk alone, the meat so tough and the knives so dull that it is impossible to cut it; the bread either burnt or doughy, and the milk sour.

Of course, this is not always the case; for even

in the life of a drummer there are oases, green spots in his memory of a pleasant country hotel where the milk is sweet, the butter fresh, the bread white and nicely baked, and the meat tender and well cooked. But such home-like hotels are few and far between in the Far West; and whenever a drummer is so fortunate as to visit one, the news of the discovery is quickly imparted to all his colleagues who travel in that particular section.

Sundays on the road are none too enjoyable; more often than otherwise the drummer is compelled to spend the Sabbath in a little out-of-the-way town, where he is thrown entirely on his own resources to pass away the hours. Too often, there is only one church or chapel, and that presided over by a clergyman whose ability is just sufficient to send his congregation to sleep during the delivery of his sermon. During the winter months, when the snows blockade the railroad tracks, he is often compelled to stay in one small town, comprising an hotel, a few general stores, drug store, and maybe a drinking saloon or two, for days at a time, when connection with the outside world is entirely cut off, when he cannot see a newspaper for days, and when the only occupation which offers itself is to flirt with the waiter-girl at the hotel, or play draughts with the store-keeper, or draw poker with the saloon-keepers. Of all the dreary places in the winter, one of these small towns, built out on the broad prairie, as many of them are, without a sign of a tree or shrub within sight, is, I think, the dreariest even when the trains are running regularly; but when the snow blockades the road, then, indeed, is the unfortunate drummer deserving of sympathy. But regardless of all these trials and annoyances, the drummer is still the same jolly, fun-loving, reckless sort of fellow, always ready to lend a helping hand to any fellow-being in distress, never passing by a worthy object of charity without a bountiful donation, always ready to flirt with a pretty girl or attend a country-dance, but always with his weather-eye open for chances to sell goods, and looking out for the interests of himself, his firm, and his customers in such a manner as none but a real live American drummer can.

THE WESTERFIELD SCARE.

IN TWO CHAPTERS.—CHAP. II.

AFTER this, nothing was seen or heard of the man-ape for upwards of a week; but then came a piece of startling news indeed. Lady Dacre's mansion, which was situated about a mile and a half beyond the town boundary, had been broken into, and jewelry of the estimated value of three hundred pounds stolen therefrom. From the evidence, there seemed little or no doubt that the man-ape was the thief. It appeared that while the family were at dinner, Lady Dacre's dressing-room, which was on the second floor, had been entered from the window and the jewel-case rifled. The window in question overlooked a lawn at the back of the house. The wall outside was thickly covered with ivy, said to be nearly as old as the house itself, by the aid of which the thief had doubtless been enabled to reach the

window. A shaded lamp was burning in the room at the time. The robber, in order, no doubt, to secure himself from interruption, had locked the door which opened into the corridor, but had omitted to notice that the dressing-room was only divided from the bedroom by a *portière*. Through this *portière* Lady Dacre's maid presently appeared on the scene, just as the rascal was in the act of rifling the jewel-case. For a moment the two stood confronting each other, then, with something between a snarl and a cry, the man-ape took one stride towards the woman, who thereupon gave utterance to a loud scream and fainted. The only description she could afterwards give of him was that he was exactly like a huge monkey, except that he stood perfectly upright like a human being.

A detective came down from Scotland Yard, and after lingering about Dacre House and its neighbourhood for nearly a fortnight, was seen no more.

Then Lady Dacre, in her turn, offered a reward, this time of fifty pounds, for 'such information as would,' &c.; but most people were of opinion that nothing would come of it, even as nothing had come of Squire Dallison's offer. Meanwhile, the creature was at its pranks again, as audacious as ever. And yet, as people asked themselves in dismay, what was it possible to do under circumstances so unprecedented that not even the oldest inhabitant could remember the like of them! It seemed as if the whole town lay helpless and at the mercy of one daring and unscrupulous ruffian. It was a veritable reign of terror on a small scale. Nobody guessed, I least of all, how soon and by what a singular chain of events it was destined to be put an end to.

My father's house, which was the end one of a row of cottage tenements all alike in size and appearance, might be said to abut on the churchyard, seeing that it was only divided from the wall which enclosed the latter by a gravelled footway. Front the back of our house, and following the line of the churchyard, ran the high wall which on that side shut in the old grammar-school and its playground. Along the base of the churchyard flowed the little river Ken. On the farther side, shrouded by its elms and beeches, stood the vicarage; while on the fourth side was the main entrance, with its beautiful wrought-iron gates, of which the townspeople were justly proud.

In the gable end of my father's cottage was a window which looked full on to the churchyard: it was the window of my bedroom. One night when my father had been more restless than usual and unable to sleep, I sat up with him for company's sake till between twelve and one in the morning. When at length I went to my room, I went without a light. It was too late to think of reading, and I could undress as well in the dark as not. I drew up the blind and stood looking out for a little while, not thinking much of what I was doing, but rather wondering how long a time it would be before I should be able to get back to Mr. Aycough and my beloved flowers. Then, all at once my eye was caught by something which broke up my waking dream in an instant, and brought me back to the place and the hour

with a sort of shock. What I saw was a faint yellow disc of light, evidently emanating from somewhere in the churchyard, and nearly in a line with my window. All the stories I had heard about the man-ape flashed at once across my mind. Motionless and almost breathless, I stood and watched the light, which shone with a faint steady glow, and never varied its position by as much as a hair'sbreadth. For a space of about two minutes I stood thus without taking my eyes off it; and then all at once it was gone, and though I stayed watching for upwards of an hour longer, I saw it no more.

I said no word to any one of what I had seen; but next morning I made a careful examination of that portion of the churchyard which was visible from the window of my room. Not the slightest sign or token did I find of any unhal- lowed midnight intruder. The grass grew rank and green on the quiet graves; tombstones of various shapes and sizes were scattered about as if they had been dropped at random, but nowhere was there anything which told of any recent living presence. There was an old right of way through the churchyard, but as it led to nowhere in particular but the river, it was but little used. At sundown the gates were locked, and remained so till morning.

My curiosity had been so much excited, that the next night found me on watch at my window again; but although I sat there in the dark and cold for upwards of two hours, my patience went unrewarded. The same thing happened next night. Then I made up my mind that should the third night prove as fruitless as the first and second had done, I would trouble myself no further in the matter. But that third night, and close upon the same hour, I beheld again the appearance which had so puzzled me before: a subdued, yellow light, or radiance, almost like a harvest moon seen through a haze, only not, perhaps, quite so large. It was as though the circular door of a furnace in which the fire had begun to burn low had been opened for a little while. As before, it was visible for a space of from two to three minutes, and then it disappeared as instantaneously as it had come. Then and there I made up my mind to solve the mystery, if it were possible for human ingenuity to do so.

The first step towards doing so was evidently to take up my watch in the churchyard itself. This, however, I was unable to do for some nights to come, in consequence of my father's illness having taken a turn for the worse which made it undesirable that I should be out of call. The first night it seemed safe for me to leave him, I let myself quietly out of the house about half-past ten o'clock. I had my father's key with me, which admitted me into the churchyard through one of the side-doors. I was warmly wrapped up in a dark overcoat, and wore on my head a close-fitting cap. I had provided myself with a stout cudgel, in view of any possible encounter at close quarters. Reading my way cautiously among the graves, I presently took up a position between two large family tombs which I had previously fixed upon. The point to be borne in mind was that I should be able to see while myself remaining unseen. A little way behind me was a tall headstone, but in

front there was nothing but a few lowly mounds between myself and the abbey. Crouching in the long grass, with my back supported by one of the tombs, I began my watch with such patience as I could summon to my aid. Now and then I raised myself cautiously and peered around. The night was starlit and windless, and around me reigned silence the most absolute. Eleven o'clock boomed forth in deep musical throbs from the abbey tower, and then, after what seemed to me a space as long as three or four ordinary hours, midnight struck. I had raised my head and shoulders above the level of the tombs for about the hundredth time, when suddenly my eyes were taken by a dark movable object faintly outlined by the starlight. Whatever it might be, it was advancing swiftly, and apparently in a direct line towards me. My head went down again in an instant; I drew closer to the tomb, and grasping my cudgel more tightly, kept my eyes fixed on the opening in front of me. Half-a-dozen seconds later a human form passed swiftly across my line of vision, which, in my crouching position, was bounded by the tomb on each side of me. The figure had come and gone almost while I had time to draw a breath—come and gone, too, without a sound, for not the faintest noise of footsteps had reached my ears—but that might perhaps be accounted for by the fact that it was walking on the grass. Hardly had it passed before I raised myself cautiously and peered the way it had gone; but already it had vanished—the darkness had swallowed it up as completely as if it had never been. I waited a full half-hour longer, but saw nothing more.

My watch next night proved of no avail; but the night following that I was more fortunate. I had taken up the same position as before; midnight had struck: a cold wind swept over the churchyard and moaned drearily among the tombs. I was chilled through and through. At length I said to myself: 'I will wait another quarter of an hour, but not a moment longer.' Scarcely had the words passed my lips when all at once I saw again the same faint disc of yellow light which I had seen twice already from my bedroom window. Now that I was closer to it, it shone out more clearly than before; still, I was utterly puzzled to know whence it emanated. It was not much raised above the level of the ground, and seemed as if it might proceed from the interior of some tomb, and yet I remembered no tomb just there which could have been made to serve such a purpose. I found that I had somewhat miscalculated its position, that is, assuming it to be in the same position as when I saw it first, which was a point I could not be quite sure about, and that from the place where I now was I could only obtain a side-view of it. If I wanted to find out more about it, I must get nearer to it, be the risk whatever it might.

I had seen nothing of the mysterious being who had come and gone so strangely two nights before, but might he not appear at any moment? It was needful to proceed with the utmost caution. Slowly and carefully I began to creep forward on my hands and knees through the wet grass in the direction of the light. About half-way towards the point for which I was making was a tall headstone; behind this I paused for a moment while I took a careful look round. I was on the

point of setting out again when, casting my eyes in the direction where the light had been but an instant before, I found it gone. Not the faintest glimmer of it was to be seen. I waited where I was for half an hour longer, but nothing more came to pass.

I could not sleep till long after I got to bed, but by next morning I had worked out a certain theory in my mind which I determined to put to the test at the earliest possible moment. Accordingly, in the course of the forenoon, taking my tape with me, I made my way to that part of the churchyard where I had kept watch the night before. Not knowing what unseen eyes might be taking note of my movements, I proceeded to measure a space here and there with my tape, as though I were selecting a site for a grave; in reality I was deciding on a spot for my next hiding-place. Just thereabouts, as it happened, there were no large family tombs behind which might be found a convenient shelter, nothing, in fact, but a few scattered headstones and row after row of nameless graves. Such as the situation was, I must make the best of it.

In the course of the day I went into the town, and from the tradesman who had the care of the abbey clock I borrowed a powerful opera-glass, and from an undertaker a mourner's cloak long enough to shroud me from head to foot. I was now ready for my enterprise. The evening, however, brought wind and rain, which before midnight increased to a storm, and the next night proved nearly as bad: it would have been madness to take up my watch under such circumstances. The third night was fair and clear, and at half-past ten I let myself out of the house, carrying with me not only my 'inky cloak,' but a couple of old overcoats to spread on the ground. I made my way stealthily to the particular headstone I had marked out beforehand. It was a very old stone which had settled down a little on one side, so that it now stood somewhat askant, while the mound whose inmate it was intended to commemorate had by this time sunk nearly to the original level of the churchyard. Here I spread my overcoats, and wrapping my cloak about me, I lay down upon them. Any passer-by who might have observed me by that dim light would merely have taken me for one mound more among the scores that surrounded me.

Eleven o'clock—midnight. Ten minutes later the mysterious light shone suddenly out, clear and steady; but this time I was not more than twenty yards away and in a direct line with it. My theory was verified. The light proceeded from a small circular grated opening in the outer wall of the abbey about a couple of feet above the level of the ground outside. The aperture in question was an air-hole, or it might even be called an unglazed window, to the family vault of the Deromes of Standish, one of our great county families. This vault, like three or four others pertaining to families of distinction, had originally been formed by enclosing a portion of the crypt, which at one time had extended under nearly the whole of the abbey. Access could be had from the churchyard to any of these vaults by means of a low-browed, iron-studded door, below the level, and reached by a descent of three or four steps. But whenever a funeral took place, a portion of the flooring of the abbey

immediately over the required vault was removed, and the body lowered to its last resting-place below.

I now found the value of my opera-glass. By its aid, a certain section of the interior of the vault was clearly visible to me. On a ledge behind the grating a lamp was burning. Close by stood a man with one of the most unprepossessing and evil-looking faces it has ever been my lot to behold. He was close-shaven, and his short black hair came down to a point in the middle of his forehead. When he lifted his head for a moment as if to observe the flame of the lamp, I was able to see that he had a cast in his right eye, and the healed scar of some old wound or gash in his upper lip. He wore a sort of loose pea-jacket, which just now was unbuttoned, exposing a portion of his chest, which was thickly matted with long brown, coarse hair, as it might be the chest of some wild animal. A thrill ran through me from head to foot. I could no longer doubt that I was on the track of the mystery which had baffled all Westerfield for three months past. What ought I to do? What step ought I to take next? If I could but be the means of bringing this scoundrel to justice! If I could but succeed in securing the reward!

In my excitement I had risen to my knees, and was still gazing with the glass to my eyes, when a shrill cry rent the air close behind me. I was on my feet in an instant. I had heard no one approach, but not more than a yard or two away stood a woman; evidently the long grass had deadened the sound of her footsteps. I was nearly as much startled as she was, but there was no time for thinking or wondering. Scarcely had her cry shattered the silence, before the light in the vault disappeared, and scarcely was I on my feet before the woman had screamed out: 'Bill, we are betrayed!' Then was I aware of a second figure springing towards me over the grass, which I knew could be none other than the man I had seen in the vault, and I felt that I was on the point of being attacked; but my cudgel was on the ground and I was entangled in the long cloak, and before I had time to do more than fling up one arm instinctively, there came a crashing blow on my head which felled me like a senseless log.

When I came to myself I was in darkness. My head ached as it had never ached before, and my dazed senses refused for some time to tell me more than that I was alive and in great pain. Little by little, however, the evening's incidents began to recall themselves brokenly to my memory, so that, after a time, I was able to piece them into a consecutive whole up to the point of my having been struck on the head and rendered unconscious. But what had befallen me after that? Where was I now? By-and-by I contrived to sit up and stare around. Everywhere darkness the most profound. I was chilled to the marrow and ached in every limb. The atmosphere I breathed was cold, but not with the fresh frosty coldness of the open air; it was the coldness of a place long shut up, which no sunlight ever penetrated; there was about it, too, a damp earthy flavour which could almost be tasted. Then all at once it flashed across me that the place in which I was could

be none other than the vault of the Deromes. Scarcely had this conclusion forced itself on me when the abbey clock struck three, the sound reaching me with a sort of muffled clang from somewhere overhead. I had lain there unconscious since a little after midnight.

Presently I contrived to get upon my feet, although my head felt strangely dizzy and I seemed to have no proper control over my limbs. Once before, when a schoolboy, I had been in the Derome vault with my father, and I had a clear recollection of what it was like; for it was a part of my father's duties to visit each of the vaults, as a matter of fact, two or three times a year. I knew that, ranged around me on their black marble slabs, lay some score or more of dead and gone Deromes in their leaden coffins cased with oak. But it was a thought that had no terrors for me. All my life I had been too familiar with death and the grave to feel myself thrilled by any touch of the supernatural or any ghostly fears, even now when I knew in what place I was at that hour and alone.

With groping outstretched arms I went forward slowly, step by step, till presently my fingers encountered a cold smooth substance, which I at once guessed to be one of the slabs already mentioned. All I had to do now in order to find the door was to keep on feeling my way forward, slab by slab, till I should reach it. My only fear was that I should find it locked, in which case I should be a prisoner, at the very least, for several hours to come. Happily, I found it merely shut to, and was able to open it without difficulty. Never in my life had I felt more thankful than when I stumbled out of the last home of the defunct Deromes and found myself once more under the free sweet air of heaven.

By six o'clock my story had been told to the superintendent of police, who was called out of his bed on purpose to hear it. Thanks to the description I was able to give of the fellow, both he and his wife were arrested about a week later at Liverpool. The man proved to be a very notorious character, who was 'wanted' for certain other offences against the law, perpetrated in the south of England. To him punishment was meted out in due course; but the woman was acquitted, and it is chiefly from her after-confession that I am enabled to supplement my own narrative with the following particulars.

The woman in question was a native of Westerfield, and had at one time been employed as housemaid at Standish, the seat of the Derome family. She had afterwards gone to London, where she had fallen in love with and married a worthless scamp, who in days gone by had been a gymnast in a circus, but had latterly taken to more dubious modes of earning a livelihood. At length the hue-and-cry after him became so hot that he determined to go into close hiding for some time to come. In this emergency his wife bethought herself of the vault of the Deromes in her native town as a likely spot where her husband could lie by till the heat of pursuit should have somewhat slackened. Her residence at Standish had made her acquainted with the existence of the vault, and she was aware that the big old-fashioned key always hung on a certain nail in the armoury. Having been somewhat of a

favourite with the housekeeper at Standish, it seemed only natural, when she returned to Westerfield—where she gave herself out as a widow—that she should go up to the Hall to pay her respects to that personage. The opportunity was utilised by her for purloining the key, which a second visit, made on some pretext or other a day or two later, enabled her to replace on its nail before it had been missed.

By this time she had engaged humble lodgings in the town, and her husband had taken up his quarters in the vault, where he had a sufficiency of blankets and warm clothing, not to speak of a frequently replenished brandy flask, to keep him from suffering from the chills and damps of his strange domicile. His food, which was bought in small quantities at different shops in the town, so as to avoid suspicion, was conveyed to him by his wife at night; and as he knew exactly when to expect her, he placed his lamp in front of the grating as a guide to her through the intricacies of the churchyard, the light being shut in at other times by an extemporised curtain. Both the man and his wife were aware that that side of the churchyard was overlooked by one window only, but as they never saw a light in it, they had come to the conclusion that the room to which it pertained was unoccupied. But not every night did the lamp shine through the grating. Sometimes the man met his wife at the low wall by the river, where there were no railings, and where easy access could be had to the churchyard by day or night. It was only when he was too lazy, or otherwise disinclined for stirring out, that the signal was shown; whereby, as we have seen, came his own undoing.

It would seem that in the course of the man's professional career he had more than once personated an ape in a pantomime, and that he still retained the tight-fitting hairy dress and mask used by him for that purpose. Tired, and no wonder, of his long days and nights in the company of the dead and gone Deromes, it had seemed no more than a pleasant relaxation to the fellow to scare and terrify the good people of Westerfield as they had never been terrified before and never have been since. When funds began to run low, an easy mode of replenishing them was found in the contents of Lady Dacre's jewel case. Doubtless means and opportunities were not wanting for disposing of the diamonds and other gems which came into his possession on that occasion; in any case, none of them were found on him at the time of his arrest.

A few last words and I shall have done. Not only were the rewards offered by Squire Dallison and Lady Dacre paid over to me, but the townspeople subscribed among themselves a further sum on my behalf, so that, altogether, I was enabled to put away more than a hundred pounds into the savings-bank. Three months later I married. My father lived for some years longer, and although before his death he came to understand that he was the last member of the Holditch family who was likely to fill the post of sexton to the old abbey church, he was never quite reconciled to the necessity, neither could he be made to understand why his only son should have so far degenerated as not to feel a pride in following in the footsteps of so many of his progenitors.

As long as he lived, Mr Ayscough remained my true friend, and to him I owe much of the prosperity with which my later years have happily been crowned.

A BLIND STREET-MERCHANT.

AMONG the many curious acquaintances with whom my world-wanderings have brought me into contact, not the least interesting is this blind street-merchant; a man whose last glimpse of light and life was forty years ago, and to whose eyes the brightest day does not differ from the darkest night. The casual passer-by would doubtless write down my friend in his mental category as a 'poor blind beggar;' but the latter would repudiate such a description of himself with indignant scorn, for he reasonably maintains that he is as much a 'merchant' as any peripatetic dealer, perambulating barrowman, or other 'sighted' persons, as he terms them, who obtain a living by selling goods in the street. For ten long years, in winter and summer, he has stationed himself against a wall in a certain suburb of London, and with his box of humble wares in front of him, awaited with saint-like patience the tardy advent of his infrequent customers. Taking advantage of my position as one of these, I one day entered into friendly conversation with him, and was agreeably surprised at his knowledge of matters, political and otherwise, that were going on around him, and as well at his general cheerfulness.

It was a welcome break in the monotony of the tedious day, he informed me, when a customer exchanged a few words with him, a luxury he enjoyed but seldom: his chief gossips and informants being the kindly policemen on the beat. He was very eloquent upon policemen and their kindness to him, and told me with a gratified smile how he was indebted to the influence of some good-hearted officer high in grade for the remission of his hawk's license, a matter of no small moment to him.

Yet, sad to relate, even this poor helpless fellow found an enemy; for some peculiarly heartless specimen of humanity had complained several times to the officials of the station in whose vicinity my blind merchant took his purgatorial stand, that 'such a nuisance' should be permitted to come betwixt the wind and his nobility. His inhuman complaints, however, had no effect; and so in winter and summer, in scorching heat and bitter cold, the sightless vendor of lights and laces, after his two-mile-walk from home, is to be seen at 'business' from nine in the morning until about eight in the evening all the year round, except Sundays, only leaving his post, or rather his wall, for a little needful refreshment.

But to counterbalance such unaccountable enmity, my friend assured me that he was happy in the possession of a goodly number of friends and many regular customers. Among the latter were two benevolent creatures, who to their regularity added a certain amount of eccentricity. For months they had been constant contributors to the humble store of the blind merchant—whose weather-beaten visage lighted up with a pleased expression as he spoke of them—but had always passed their donations in absolute silence, never

speaking a word. 'No, sir,' said my informant in answer to my interrogations; 'neither of them, singular to say, has ever exchanged a word with me; but I know them by the manner in which they put the money into my hand! A gentleman used to give me twopence every day. One week I missed him until the Saturday came round, and then I felt the same kindly pressure of the hand and found a shilling in my palm. Ever since then this kind gentleman has given me the same amount every Saturday afternoon.

'My other best friend is a good soul who gives me threepence every Saturday, like the former, as sure as the week comes round, God bless him! About a year ago I missed him for six weeks—you see I have nothing to do but keep account of such matters—and I thought I had lost him; but no; up he came one Saturday and put eighteenpence into my hand—that's six threes, you know—and away he went without a word!—But that's not all,' he continued. 'Some time back I really thought I had lost him for good; and one day, after he had been away for ten weeks, I was bemoaning the lack of business, and wondering how I should manage at home, when up comes my lost gentleman and gives me half-a-crown—ten threepences, you see—just as though he had made a vow to give me threepence a week come what would! Being curious to know what sort of people in appearance my two good Samaritans were, I inquired of my friend the policeman, who described the "shilling" one as like a City merchant, and the "threepenny" one as a superior sort of working-man.'

Many subsequent conversations quite disabused me of my previous idea—which I presume I hold with most people—that the world is a blank to the blind, and that with the loss of sight all the pleasures of life are blotted out. Having missed my blind friend from his accustomed place one Bank Holiday, I inquired the reason, and he informed me that he had been out into the country—a real blind man's holiday! 'I went with my daughter to Abbey Wood yesterday, sir,' were his words; 'and a capital day I had, and thoroughly enjoyed myself. You see, my daughter describes the scene to me, and I can remember things—I was nearly twenty when I became blind—so that I have the picture in my mind at once, and can see the trees and the fields, the cows, the streams, the hedges, and the woods, just as well as you, sir. Then I went nutting, too; I felt the leaves and the branches, and picked the nuts almost like a "sighted" person. Then my girl would pick a flower and tell me the colour while I felt the shape, and it was pictured to my mind directly.—O yes, thank God! I have many advantages over a person born blind.—And yet,' he continued thoughtfully, 'it is a debatable question how the balance lies. You see, as I said, I only require a description of any object or scene to bring it to my mind; but, on the other hand, although a person who is born blind is debarred from this undoubted pleasure, what his eye has never seen his heart cannot grieve for!'

'But I suppose the born blind can realise to some extent by description what they lose through not having their sight?' I inquired.

'Not a bit, sir,' replied my friend. 'In the school to which I first went after becoming blind, we who had lost our sight, by accident could not

make the slightest impression upon the minds of those who had been blind from birth. We would sit round the fire enjoying ourselves in our own way, singing and telling stories; but no matter how vivid our descriptions of scenes and objects might be, they had absolutely no meaning whatever for those born without sight.—I remember one young fellow—although it is difficult for a person blessed with the power of vision to credit such a speech—who was very clever at music, the organ and such instruments, and who declared he would not give his little finger for the 'best eyesight you could give him! Another, after listening attentively to all we could urge in favour of man's greatest blessing, said with a light laugh: "Well, I don't care what you say about seeing; give me a good dinner before all your sight!" While a third actually doubted if he could find his way about the town as well with eyes as he could without, and felt sure he should be knocking his head against every corner.'

These strange utterances astounded one at first hearing; but it is easy to understand that those born without sight can have no conception of the appearance of objects and scenes, and that it is impossible to give them any idea by the most striking description; yet none the less it grates strangely to hear a good dinner considered a desirable equivalent for the most precious gift of vision.

During one of my conversations I ventured to hint that the absence of amusements and reading must make life exceedingly dull for the blind; but received in reply the information that there are many recreations for the sightless which the outer world knows not of. One almost inconceivable game is 'blind' chess, in which each player feels his own and his antagonist's men, and so notes the progress of the game, each piece having a peg to fix in the board. To mark the difference between the opposing hosts, one set has a top-knot to each piece, the other being smooth. An even more startling kind of game for blind people to play is skittles! This, however, is generally played with a 'sighted' person to assist, and when there is no such individual at hand—he is generally the porter or gardener of the establishment—a sharp lad is chosen, whose duty it is to count the fallen pins and stick them up again. A paper on the various pastimes of the blind, how they play at 'touch' and at other almost incredible games, how they write and generally amuse themselves, could be made very interesting, but would unduly prolong this little sketch.

Among our countless benevolent enterprises, one of the most useful and truly beneficent is assuredly the Society which has for its object the supplying of embossed reading-books for the blind. This merciful and Christian institution sends out its well-laden emissaries—and a load of bulky 'blind' books is no joke—to distribute and exchange its literary treasures among its poor dark clientele; and it does not require a great effort of the imagination to picture the pleasure with which the advent of this itinerant library is hailed. In this way my informant assured me that he had read the *History of England* from its earliest times to those of the Georges—with the exception of two volumes which he had failed to obtain—besides many other works, essays, &c. Reading, he said, was a great solace to him at all times;

and many a sleepless hour has he whiled away at night by reading in bed with his open volume upon his breast.

The rapidity with which he read astonished me; the volume was Proctor's *Lectures on the Sun*; and after getting a fair start with a sentence or two, he proceeded quite as quickly as an ordinary schoolboy would read a given exercise, reading from left to right, and following on with the next line from right to left, and so on backwards and forwards in unbroken continuity.

It would be difficult to conceive, one would think, of an advantage which a blind person has over one gifted with sight; but my humble friend claimed such a one, laughingly telling me he could read in bed in the dark; and even on very cold nights could place his book under the bed-clothes, and in luxurious comfort pursue his nocturnal studies to his heart's content.

With one more instance of a blind man's superiority to a 'sighted' person under certain circumstances, I will conclude. One dark foggy night, when, as they say, you can scarcely see your hand before you, and there is one of those filthy opaque mists of which London is supposed to have the monopoly, my friend was wending his way home after his day's business was over. Of course fog or no fog did not matter to one to whom it was always night, and so, knowing every step of the road, he was making the best of his way—he walked at a good pace—when a belated passenger whom he overtook requested to be directed to a certain street.

'Take my arm, friend,' said the blind man; 'I am going that way.' And the two walked steadily along, the lost traveller not for a moment suspecting his guide's affliction, and taking the frequent taps of his stick on the pavement as only a reasonable precaution on such a night. It was not until they arrived at the required corner that the surprised individual discovered that his friendly companion was blind; and he finished up his expressions of astonishment at the singular circumstance with a hearty burst of laughter, in which my old friend was not slow to join. And assuredly such an instance, not of 'the blind leading the blind,' but of the sightless conducting the seeing through the dangers and difficulties of a London fog, must be unique even among the wonderful things that have been achieved by those afflicted with the loss of sight.

EVENING IN AN OLD CITY.

Down the long street of the gray old city on either side the soldiers stand, with drooping heads and arms reversed. Up the road comes the tramp of many feet, moving in slow unison, following the flag-draped bier. Under the old gateway of the city they pass silently up the hill towards the cemetery. The sky is gray and still, and the trees hang heavily over the road, their bright autumn hues showing neutral against the scarlet uniforms. The *Dead March* breaks out wild and mournful as the procession winds slowly out of sight, leaving the long street desolate and empty, the boom of the drum coming heavily down the wind. We pass under the ancient archway, through the quiet close, with avenue of trees and

restless rooks, past the long Minster, away into the quiet water-meadows, where the river winds level and clear down the valley. All round slope the naked downs, gray against the valley's marshy green, and the reaches of pale-blue sky above. No sign of death or any token, only clear-flowing river, and round about the mighty hills, and freshness of light and colour, and springing of the vigorous grass. Suddenly, a rattling crash like thunder comes from the cemetery on the hill, and another and another, as the soldier's requiem is sung by powder from a hundred rifles. Wreaths of smoke float lightly, slowly, down the valley, and stillness falls again, broken only by the rooks in the old elms along the river's brink, who flap uneasily among the branches in the fading light.

Up on the downs, in the steely gray of the autumn evening, the wind sings through the low bare hedges and the long rank grass on the steep banks. The feathery tops have a slight purple tinge as they are bent and blent in the breeze, and the shorter grass below is russet yellow. The scattered thorn-bushes have a rich red and yellow bloom on their small leaves, suggesting the presence of many a varied hue only to be discovered by close inspection. This suggestion of colour is part of the peculiar charm of autumn. In summer the local colour is so dependent on the sunlight, changing as the sky changes, that an overcast day will take away half the beauty, and leave the foliage masses of dull green. But in the cloudy days of autumn, the many-hued bravery of the landscape stands out rich against the gray clouds, and when the sun shines down with dreamy golden haze, turns it into such magical beauty that we loose our detaining hold on the fleeting robes of Summer, and turn right joyously to welcome her generous sister.

Sharp and dark against the sunset sky stands the pine-topped hill in front of us, with its ancient fosse and earthwork, where the old Romans made their camp many a long century ago. Between their time and ours, the Lord Protector Cromwell kept there his watch and ward over the old city and its approaches for leagues around. The mounds are quiet and deserted now, with long rank grass where once the camp-fires blazed, amid the talk of the stern old Puritans as they tethered their horses and set their watch. What did old Oliver think about, as he leant his broad back against the rough pine-stem, while the sunset gleamed red through the trees behind him, glittering on the windows of the Minster far below? Did no compunction touch him, as he looked on the long lines of pinnacle and roof, and the darkened western end, where his men had shattered the glass of the great window? And did no doubt cross his mind, as he thought on the carved work broken down with axes and hammers? Beauty was to him a snare of the Evil One, and the red sunset but the promise of a storm to-morrow; the whistling wind and mighty sweeps and swells of upland but chill weather and so many miles to march.

A dreary and a desolate place now is 'Oliver's Battery' at nightfall, where the shades of the old Puritans walk round the darkening ramparts as of yore, keeping watch and ward. They did what they thought good to the ancient Minster, and it stands but the more beautiful therefor

to-day, with the rime and crust of centuries upon it, mellowed by the wind and weather, and melodious with the sound of organ and of chiming bells. Like a violin, it ripens with the growing years into a fulness of use and beauty which the wise old builders strove for when as yet the future was all before them. From the piled masses of brown stone on mighty column and rounded arch, to climax of their skill and labour, perfect equipoise of strength, with flowing line and delicate foliage, and many a quaint device of bird and beast and fish, stands now the great stone poem of the ages, written to many measures by many earnest hands, complete in every phase of beauty. Generation after generation of the race of those who teach their hands to express their thoughts, have carved their thought in stone, and sleep now in its shadow; while within its walls the same story is sung and carved and spoken, as it will be till the need for symbols is no more.

THE MONTH: SCIENCE AND ARTS.

We must go back nearly three centuries to find a total solar eclipse occurring on the 1st of January, as it has done this year, nor will another event of the same kind occur on New-year's Day until the year 2161. On no former occasion have such preparations been made for it, and never before has such an army of astronomers and volunteer observers been enrolled to watch the interesting phenomena which attend such an eclipse. It speaks well for the enthusiasm of these observers when we remember that many of them undertake a journey of thousands of miles in order to view a spectacle which lasts at the most about two minutes, and which by the very possible interposition of clouds may not be visible to them. But, according to all accounts, the weather at most of the stations was propitious, and valuable observations were made. Since the photographic camera and the spectroscope were enlisted into the service of astronomical research, these total eclipses have been regarded with increased interest, and each one helps towards the solution of problems of great importance to science.

The invention, some years ago, by Parkes, of celluloid at once placed in the hands of manufacturers a compound which could be used for most purposes in which ivory, which is every year becoming more scarce and expensive, was formerly employed. Knife-handles, the keys of pianofortes, and even billiard balls, have been made from the new material, which has also been employed for the manufacture of washable shirt collars and cuffs for those who grudge the expense of clean linen. Hitherto, this substance, which is a compound of camphor and collodion, has been opaque; but by a recent modification, it is now manufactured in thin sheets which are almost as transparent as glass. This material has been recently introduced as a support, instead of glass, for photographic dry plates, and there is every indi-

cation that it will be extensively used for this purpose. Besides the great saving of weight and the absence of brittleness, there are other advantages of a technical nature which will cause this new departure to be received with enthusiasm by photographers.

More than one writing-telegraph has been invented, and we can find the germ of such an apparatus by turning to the pages of any of the old text-books on electricity. None of these has, however, gone beyond the experimental stage, each having imperfections of either speed or style which prevented it competing with more ordinary methods of electrical communication. It is said, however, that Professor Elisha Gray has now completed a writing-telegraph which is perfect in its action and which transmits handwriting faithfully. There is no doubt that such a telegraph would be extremely useful in certain cases, but for ordinary needs existing systems are sufficient.

A gas-propelled carriage which was shown at an Exhibition of Machinery at Munich last year is described and illustrated in one of the German papers. This novel vehicle has the appearance of a large tricycle, bearing an ordinary carriage body with seats for four persons. The motor is charged with gas, which it generates from benzine or some similar fluid, the vapour so generated being ignited in a closed cylinder by an electric spark. The benzine is contained in a copper receptacle beneath one of the seats, and enough can be carried to last for a journey of seventy-five miles. Although this vehicle can be driven if required at as high a speed as ten miles an hour, it is so perfectly under control that the driver can go at a walking pace if he so desires. Experiments with the gas-carriage are said to have been highly successful, and it is obvious that if this be the case, it will have a wide future before it.

A most ingenious form of telephone, and one which seems to be quite distinct from the well-known 'Bell' or other patterns, has been produced by Mr James Lowth, and called after him the Lowth Telephone. It is being introduced by a Company in Chicago, and is said to work well. The instrument consists of a receiver and transmitter in one, and the novel point of the apparatus lies in the circumstance that whilst the receiving part of the contrivance is naturally held to the ear, the transmitter, in the form of a projecting plug, presses against the exterior of the throat, and takes up from that organ the mechanical vibrations caused by speech. These muscular vibrations are converted into undulating impulses of electricity, and are so conveyed to the distant correspondent by line-wires. This new system of telephony is said to work well, and to be free from defects which are found in older methods of speech-transmission.

Mr G. J. Symons, the well-known meteorologist, believes that fogs, not only in London, but elsewhere in these islands, are on the increase. This is unwelcome intelligence for all; for, both directly and indirectly, fogs lead to much loss of life. It is also worthy of notice that even plant-life is not exempt from their baneful influence. In the Royal Botanic Society's conservatories, many of the plants have during the late foggy weather shed both leaves and flower-buds. This

is especially the case with Australian plants, which are so dependent upon sunny weather for their healthy condition. But it is not alone absence of light that they have suffered from, but because of their pores becoming clogged with those sulphurous and carbonaceous particles which are so plentifully dispensed by the smoke of London.

The Miniature Pocket Type-writer (the Miniature Type-writer Company, Swan Arcade, Bradford) is an instrument which weighs only four ounces, is so compact that it can be easily carried in the pocket, and at the same time will print any matter in legible type. It is certainly a marvel of ingenuity. The little contrivance comprises a rotating disc, on the under side of which the types protrude; an inking roller which supplies ink to the types automatically; and a roller furnished with a ratchet, by which the instrument is made to travel over the paper, and the necessary space is preserved between the printed letters. This form of type-writer can, of course, never compete in speed with those instruments which are furnished with keys, but it is something more than a toy, and will be very useful to those who occasionally want matter printed instead of written.

The introduction of mineral oil for domestic lighting purposes has been a great boon to the working classes, for they are at once supplied with a cheap and efficient illuminant, which replaces the farthing 'dip' which many of them were compelled to use, and in many cases to work by. But the cheap oil fostered the introduction of cheap lamps in which it could be burned, and these lamps have brought disaster and death to many a household. Indeed, the number of fatal accidents which are caused by the use of these lamps is positively appalling, and many attempts have been made by inventors to produce a form of lamp which shall be inexplodable. One form of these we have recently had the opportunity of trying; it is called the 'Protector Safety' Household Lamp, and is so constructed that the wick has no direct communication with the oil-chamber. It is a hand-lamp which can be carried about with perfect safety. The 'Protector Lamp Company' makes these lamps at Eccles, near Manchester.

A few years ago, an important alteration was made in harnessing the dray-horses used by one of the French Railway Companies, and the method has proved to be so satisfactory that it has been extended to all stations under the control of the Company. The improvement is confined to the traces, which are made of chain, with a strong spiral spring inserted in them. These elastic traces are found to possess many advantages besides durability. The shock or blow on the collar at starting is far less violent and injurious to the horse, and the animal soon learns that a steady pull without jerks will do the work required of him. It is most distressing to see what difficulties horses have in starting a heavy load under ordinary conditions, and we trust that the system described may be widely adopted.

A specialist interested in the question of Children's Sight lately tested the vision of fifty boys indifferently chosen from a public elementary school in London. Only twenty-three out of the fifty were found to possess normal sight; 'twenty more only attained an average visual value of

three-quarters; and the remainder were not more than one-half, one being as low as one-fifth. None of these boys had ever worn glasses, and as we further learn that few could afford to purchase such aids to sight, it is perhaps a fair inference to assume that defective nutrition, owing to privation, may be at the bottom of this mischief. The subject is one of such great importance that it should be taken up and thoroughly inquired into by the authorities.

We have more than once commented upon the fearful loss of life which annually occurs in India from snake-bite. It has recently been computed that there are in that country two hundred and thirteen separate species of these reptiles, but less than one-sixth of these are poisonous. It is stated that an effectual barrier to their entrance into a house is afforded by a line of carbolic powder strewn across the doorway. But before adopting this remedy, care should be taken that the enemy has not already become a lodger, for the same line of defence would most surely prevent his exit.

The *Athenæum* publishes an interesting account of a young gorilla belonging to a trader on the south-west coast of Africa. It follows its owner like a dog, and has accompanied him on a journey of twenty miles, walking the entire distance. It is very docile and tractable, and weeps like a child if it is left alone by its master. The animal seems to have acquired many civilised tastes and habits, and will drink different liquids out of a cup or glass like a human being. This is by no means the first instance of a gorilla being brought under subjection by kindness. It will perhaps be remembered by some of our readers that a baby gorilla was a few years ago exhibited in London, but the severity of an English winter was fatal to it.

What may be called the science of burglary has now attained such a perfection that householders, if they would preserve their valuables, must endeavour to cope with it in a scientific manner. We are all too prone to shut the stable door after instead of before the horse is stolen, and we doubt not that those who have been 'burgled' have since been most careful to guard both their doors and windows. In these days, when electric bells are fitted to all modern residences, it is an extremely easy and cheap process to so extend the system of wires that all entries can be made to give an alarm directly they are attempted by the burglar. A gong ringing out persistently in the dead of night will frighten away the most courageous robber, and it is in one respect better than a barking dog, for the reason that it cannot be silenced by drugs, or any other means within the power of the intruder.

A correspondent of the *Zoologist* believes from observations made in his London house that mice and cockroaches are in some way antagonistic to one another. He notes that although the disagreeable so-called 'black beetles' had been numerous in his residence for some time past, they have completely disappeared before an invasion of mice. 'Do mice eat cockroaches?' he asks, or do they merely disperse them by consuming the food upon which they depend? We should be inclined to think that there may be some local circumstances to account for this result; or perhaps, as the correspondent himself suggests, the season may have been prejudicial to cockroaches

and favourable to mice. It is certain that in many households both flourish to a most disagreeable extent.

In a recent paragraph we referred to some experiments which have been conducted by the sanitary authorities in New York with steam as a disinfecting agent for clothing, &c. Our attention has since been called to the circumstance that a similar system has been in use in this country for some time, and has been found so successful that it has been adopted in many public institutions in different towns. The following are some of its advantages: No chemicals are used; no article of dress need be unmade; colours are not affected by the treatment; all germs, eggs, and insect life are instantaneously destroyed; the steam being under pressure, will penetrate closely packed bad conductors of heat, such as feather-beds; and the articles submitted to the process remain perfectly dry. The apparatus used is known as Washington Lyon's Patent Steam Disinfecter, and all particulars concerning it can be obtained of Mr Lyon by addressing him at 85 Asylum Road, Peckham, London, S.E.

A French doctor during a recent residence in Tonquin has successfully employed *mercuric chloride* as a remedy in cholera. This salt is one of the most poisonous compounds known, and is otherwise called corrosive sublimate. Although it appears in the British Pharmacopœia, it is very seldom used for internal administration, and then only in doses of about one-tenth of a grain. The doctor referred to employed it in still smaller quantities, and found that by its use the mortality was reduced from sixty-six per cent. to about twenty per cent. The drug was also found effective as a preventive measure in cases where perhaps one or two only of a community was attacked with the dire disease.

Spong's Patent Gas Utiliser is a little contrivance which can be fitted on to any fish-tail burner. It consists of a spoon-shaped piece of nickel, which is so hinged on to a clamp which embraces the burner that it can be made to impinge on the flame in a certain direction. This causes the flame to spread out, and to give a greatly increased light with the same quantity of gas. We attribute the result to change of shape in the flame, and also more perfect combustion brought about by the agency of the heated metal disc.

Another expedition to the North Pole is projected, this time by our Norwegian neighbours. It is asserted that a picked set of men, used to contact with snow and ice, and for whom the rigours of an arctic journey would have few terrors, could readily be mustered. It is proposed to despatch the expedition on its journey in the summer of 1890, the leadership being offered to Dr Nansen. The attempt to reach the Pole would be made *via* Franz Josef's Land, a route which many students of the subject have advocated.

The Early Roman church on the heights of Dover, the oldest Christian fabric in the country, has just been restored, and reopened for public worship. Its foundations were laid fifteen centuries ago, and the spot where the Roman soldiers' altar formerly stood, and the widow through which the sentry could see whether the lamp was burning before it, can still be pointed out. This

interesting old building is almost touching the ruin of the old pharos or lighthouse which guided the Roman galleys to their home. In one respect this latter building is unique, so far as this country is concerned, for it is built of volcanic tufa. As this stone is not found in the district, it is presumed that it was carried here as ballast in the Roman ships.

• TOBACCO AS A DISINFECTANT.

THE habit of smoking is not one that commends itself to every person. With those who abstain from it, we find no fault; but for that great number in the community who indulge in the weed, it may be interesting to know, as the result of scientific inquiry, that tobacco is not quite so black as it is frequently painted. Tobacco may not rank as a public benefactor, but, from what has recently been disclosed, it may lay claim to be somewhat of the nature of a general sanitarian. There is a popular notion, especially among the smoking portion of the community, that tobacco-smoke acts as a disinfectant; this claim, however, is, we believe, not generally supported by medical men. But it has now been shown, from the investigations and experiments of an Italian professor, Dr Vincenzo Tassinari, assistant at the Hygienic Institute of the university of Pisa, that tobacco-smoke is to a certain extent an annihilator of disease, by its action upon the growth of bacilli. Dr Tassinari has taken great pains to demonstrate its utility in that direction, and constructed special apparatus for the purpose. In order to imitate as closely as possible the process going on in the human mouth during the inhalation of smoke, Dr Tassinari passed tobacco-smoke through a horizontal tube into a chamber kept moist by a bunch of wet cotton-wool suspended in it, and containing, besides, a 'culture,' or growth, of bacilli, which he submitted to the action of tobacco-smoke. He used in his experiments the various qualities of manufactured tobacco most generally smoked in Italy—that is to say, the large Virginia cigar, the large Cavour cigar, the small Cavour cigar, and the best cigarette tobacco. The action of all these was tried severally upon seven known kinds of bacteria—namely, the so-called cholera bacillus, the cattle-distemper bacillus, pus coccus, Finkler-Prior bacteria, the bacilli of typhus and pleuro-pneumonia, and finally, the bacillus of blue pus. We say advisedly the 'so-called cholera bacillus,' because its existence is not yet positively proved.

The results obtained by Dr Tassinari were most remarkable, and amply repaid him for his trouble, the experiments showing unmistakably that tobacco-smoke considerably retards the development of some varieties of bacteria, while it effectually prevents the development of others. Dr Tassinari carried his investigations further, actually fixing the length of time during which the development of bacteria is prevented. By comparing experimentally the growth of the same micro-organisms when not exposed to the retarding action of tobacco-smoke with their development when so exposed, it was found that the smoke of the large Cavour cigar, for instance, delayed the development of pus bacilli for seventy-two hours, and of cattle-

distemper bacilli for a hundred hours, and that the same smoke prevented the formation of cholera and typhus bacilli entirely—in fact, acted as a germicide. Similar results were obtained in the experiments with other descriptions of manufactured tobacco.

Dr Tassinari attributes this annihilating effect of tobacco-smoke upon bacteria to the action of the chemical elements contained in it. He proposes to carry on further experiments with regard especially to the action of tobacco-smoke upon the bacillus of tuberculosis; and if these should prove as conclusive as those he has made with the micro-organisms named, consumptive patients may be benefited from a hygienic point of view. At any rate, the highly important results of the curious observations of Dr Tassinari, while they are of great interest to laymen, both smokers and non-smokers, deserve that careful attention of the medical profession which they will no doubt receive.

A BIRTHDAY.

Up from the under-world they come again,
Dim forms of vanished years;
And some rose-garlanded, nor known of pain;
Some pale with tears.

The golden summers of gone girlhood's days,
When all the world was young;
The glittering star-gleam; the bedizened sprays
Where hoar-frost clung.

Rose-scented gales that are the breath of June;
The north wind's bitter blast—
With many voices do they sing the tune
Of life that's past.

And could they tell us of the years to come—
Would it be better so?
But nay: the Book is sealed, their lips are dumb;
We may not know.

I can but wish you what is good and great,
True-hearted till the end,
Nor ever daunted by an adverse fate,
Nor lacking friend.

And if it be that you must tread alone
The long and empty years,
Wear still rosemary for the past you've known,
With hopes, not fears.

J. W.

SOME NOTES ON TOTEMISM.

WHAT is a Totem? Broadly, the badge of a clan or tribe, but something signifying a great deal more than mere political or social alliance. It is not only a tribal emblem, but also a family signal; not merely a symbol of nationality, but also an expression of religion; not simply a bond of union among primitive peoples, but also a regulator of the marriage laws and of other social institutions. As defined by Mr J. G. Frazer, a totem is a 'class of material objects which a savage regards with superstitious respect, believing that there exists between him and every member of the class an intimate and altogether special relation.'

The use of totems seems to have been first noticed among the North American Indians, and the word itself is an Indian one. It is taken from the language of the Ojibways or Chippeeways, a branch of the Algonquin race, who inhabited the region near Lake Superior. It is said to have been introduced into our literature by one Long, an Indian interpreter, who published a book of travels in 1791. Among the American Indians its meaning is clear enough; for with them the totems are well defined, although often curious in character. Thus, in the Ojibway tribe there are no fewer than twenty-three different totems, or clan divisions. Nine of these are quadrupeds, marking out the wolf, the bear, the beaver, and other clans; eight are birds, five are fishes, and one is the snake. In other words, the members of the tribe who carry these devices by so doing mark themselves as belonging to a distinct division of it, to be for all time and for certain practical purposes distinguished and separated from the other divisions.

It is easy enough with totems of this character to imagine a basis of worship as the origin of the tribal badge, but it is not easy to see the meaning in other cases. For instance, the totems of some of the other Indian tribes are such things as corn, potato, tobacco-plant, and reed-grass; as medicine, tent, lodge, bonnet, leggings, and knife; as sun,

earth, sand, salt, sea, snow, ice, water, and rain; as thunder, wind, and even as 'many seasons.' Now, it is hardly possible to presuppose worship in the case of many of these totems, and indeed of some of them it is evident the pictorial representation, or concrete expression in any form, was impossible. But a totem may exist without visible expression, and its nature may be indicated by a species of freemasonry.

Next to the North American Indians, the aboriginal tribes of Australia present the most developed form of totemism of any peoples of our time. Among the Australians is to be found the same use of totems as among the Indians, and chiefly taken from the animal kingdom. There are kangaroo, opossum, iguana, emu, bandicoot, and black-snake divisions among the Kamilaroi tribes. There are also eagle, crow, water, mountain, swamp, river, hot-wind, and sun totems; and the first question asked by an Australian black of a stranger is, 'Of what murdoo [family or clan] are you?' In fact, in Australia the totem seems more of a family than a clan name.

So in Africa, among the Hottentots and Bechuanas, are found crocodile-men, monkey-men, buffalo-men, and such family names as Horse, Lion, Sheep, Ass, &c. The head of the family is the 'great man' of the animal whose name he bears, and the members of the tribe will not eat the flesh or use the skin of its protecting animal.

Professor Robertson Smith in his work on Early Arabia tells us that many of the Arab tribes take their names from animals, such as the lion, the panther, the wolf, the bear, the dog, the fox, the hyena, the sheep, &c.; and that the animal whose name is borne by the tribe is not used for food by that tribe, and is otherwise treated with respect. Among the hill-tribes of India, similar clan-badges are also to be found, as the Heron, Hawk, Crow, and Eel clans of the Oraon and Mundari tribes of Chota-Nagpur.

The geographical distribution of totemism is very wide, too wide for us to follow within the limits of this article. In North America it pre-

vails among all the Indian tribes, but not among the Eskimos. In Central America it is found among some of the tribes of Panama; and in South America it is found in Colombia, Venezuela, Guiana, and Patagonia; and traces also have been supposed among the aborigines (not the Incas) of Peru. In Australia it is universal—we speak, of course, always of aboriginal peoples—and in Africa it appears to be general in the south and West, and on the equator. It is found alike in Bengal and in Siberia, in Polynesia and in China.

The Chinese system merits a word; and it is noteworthy that, on the authority of a Russian traveller quoted by Mr McLennan, 'a characteristic feature in Central Asiatic traditions is the derivation of their origin from some animal.' Thus, the Tele people are said to have sprung from the marriage of a wolf and a beautiful Hun princess; the Tugus believe themselves to be descended from a she-wolf; the Tibetans from a dog; the Mongol khans from a blue wolf and a white hind, &c. The Chinese expression for their own people is *Pu-Sing*, which means 'the hundred family-names.' In fact it is computed that there are about four hundred family-names in China, and intermarriage is forbidden between persons of the same family-name. In this connection it may be noted that some of the Australian tribes have a legend to the effect that the use of totems was introduced by command of the Great Spirit to put a stop to consanguineous marriages.

Some curious items referring to totemism are to be found in Dr Turner's book about Samoa. Thus, it is said that if a Turtle-man ate of a turtle he grew very ill, and the voice of the turtle was heard in his inside, saying: 'He ate me: I am killing him.' If a Prickly Sea-urchin-man consumed one of these shellfish, a prickly sea-urchin grew in his body and killed him. If a Mullet-man ate a mullet, he squinted. If a Cockle-man carried away a cockle, it appeared on some part of his person; and if he ate it, it grew on his nose. If a Banana-man used a banana leaf for a cap, he became bald. If a Butterfly-man caught a butterfly, it struck him dead. If a Fowl-man ate a fowl, delirium and death resulted. And so on—all going to show that among some totem peoples, if not among all, the totem has something of the quality of a fetic, as well as the significance of a family emblem.

But, as Mr J. G. Frazer shows, totems are of at least three kinds.* There is, first, the Clan totem, common to a whole clan, and passing by inheritance from generation to generation. There is, second, the Sex totem, common either to all the males or to all the females of a tribe, to the exclusion of the other sex. And there is, third, the Individual totem, belonging to a single individual, and not passing to his descendants. There are also Cross totems and some other kinds, which, however, are really only varieties of the Clan totem, and this last is the most important of all.

Regarding Clan totemism, it is to be noted that the relation of mutual help and protection includes also the totem itself; that is to say, if a man takes care of his totem, he expects the totem to return the compliment. If the totem is a dangerous animal, it must not hurt his clansmen. The Scorpion-men of Senegambia declare

that the most deadly scorpions will run over their bodies without hurting them. There is a Snake clan in Cyprus which holds to a similar belief. Among the Moxos of Peru, a candidate for the office of medicine-man must allow himself to be bitten by a tiger (the totem); and if he survives, he proves his kinship and fitness. Among the Crocodile clan of the Bechuanas, if a man is bitten by a crocodile, or even has water splashed on him by one, he is expelled from the clan, as one esteemed unworthy by the totem. But a totem must do more than not injure—it must help. Members of Serpent clans in various parts of the world profess to heal by their touch those who have been bitten by serpents. There is a Seaweed clan in Samoa which, when it goes out in canoes to fight, throws seaweed into the water to hinder the flight of the enemy; if the enemy try to pick up the weed, it sinks, but rises again as soon as some of the totem clan approach it. The kangaroo warns the Kangaroo tribes, and the crow warns the Crow tribes of Australia of approaching danger. This is all very well when the totem is a bird, beast, or fish; but one does not very well see how it will work when the totem is a stick, a stone, a cloud, an element, or a colour.

The totem bond is a much stronger affair than what we regard as the bond of blood or family. All the members of a totem clan regard each other as kinsmen, or brothers and sisters, and are bound to help each other. The Clan totem represents both a religious and a social system, because all the men and women who call themselves by the name of the totem believe themselves to be of one blood, descendants of a common ancestor, and bound to each other by common obligations and a common faith.

Some of the social aspects of totemism may be briefly referred to. For one thing, the totem bond is stronger than the domestic bond. In every totem tribe there must be members of two or more totem clans, because the males cannot marry the females of their own totem. If, then, a blood-feud breaks out between their clans, husband and wife will have to take opposite sides, and the children will be arrayed with one parent against the other, according as the custom of the people may be to trace descent through the mother or the father. Then, if anything happens to a man, all his clansmen are entitled to satisfaction, not from the aggressor alone, but from the entire clan to which the aggressor belongs. A curious illustration of this has been noted among the Guajiro of Colombia in South America. This tribe is divided into some twenty or thirty clans with descent in the female line; and it is said that if a man happens to cut himself with his own knife, to fall off his own horse, or to hurt himself in any way, his mother's clan immediately demand blood-money from him for injuring one of their totems!

Then, as to marriage, persons of the same totem may not enter into conjugal union. This rule is what is called exogamy. Some tribes say of those who marry within the clan, that their bones will dry up and they will die. Among the Australian tribes, death is the regular penalty for a breach of this rigorous rule.

Speaking generally, it may be said that marriage prohibition extends only to a man's own totem

clan. But there are also numerous cases where the prohibition extends further. Thus, a Panther of the Creek Indians may not marry a Panther; but he is also prohibited from marrying a Wild-cat woman. The Senecas were divided into two groups of four totems each: the Bear, Wolf, Beaver, and Turtle clans could not intermarry; nor could the Deer, Snipe, Heron, and Hawk clans; but a member of any one of the totems of one group was compelled to seek a mate in one of the totems of the other group.

This peculiarity seems most marked among the Indian tribes, but is also to be found among the Australians; and among these last, a very remarkable feature has been noticed—namely, that divisions of one tribe have recognised equivalents in other tribes even when the languages are different. Thus, a native can travel over hundreds of miles and be supplied with wives by the various tribes he sojourns with, for difference of language does not prevent him recognising the signs by which he can tell whether the tribal division is one into which he can legally marry.

It is impossible to go thoroughly into the origin and nature of totemism within the limits of an article such as this. But enough has been said to show that its main use among primitive peoples has been with reference to marriage. As to whether or not it took its origin in some religious idea, or whether the religious aspect has been an aftergrowth of the social custom, opinions continue to differ widely. In brief, it may be said that Mr McLennan thought that totemism was necessarily connected with animal-worship; that Mr Herbert Spencer thinks it was a confused sort of ancestor-worship; that Sir John Lubbock thinks it originated in nature-worship; and Mr Staniland Wake thinks that it had a good deal to do with the oriental belief in the transmigration of the soul, and was a combination of nature-worship and animal-worship.

Author of 'VAL STRANGE,' 'JOSEPH'S COAT,'
'RAINBOW GOLD,' etc.

CHAPTER X.

It may be supposed that Isaiah made a purposed detour, or that his business led him away from the high-road. In either case the boys saw no more of him, though they bore straight on for some seven or eight miles before resting. They were excellent pedestrians, both; and after their parting with Isaiah they walked in better heart than before. They had an elder's sanction for their enterprise, however reluctantly expressed; and even John felt a little the brighter for the encounter, though in a twilight kind of way. They bought the envelope and the postage stamp, according to promise, and William wrote the address at the stationer's counter in his round school hand.

They were dusty and a little footsore when at sunset they entered the old-fashioned town of Warwick. Its cobbled streets and ancient gables looked unhomelike to William's eyes; and John clung to his protecting companion's sleeve, as if the strangeness of the place frightened him. Will's first business was to secure a lodging for

the night, but he was shy of making inquiries, and looked about rather hopelessly. People who walked briskly in the streets seemed too busy and important with their own affairs to be accosted, and idlers looked too unconcerned and unsympathetic. The two lads drifted hither and thither, reading the legend 'Lodgings for Travellers' or 'Beds for Single Men' in windows in some of the by-streets, but repelled by the aspect of the houses. Will was afraid of the inns because of the slenderness of his resources; and from a native and cultivated prejudice in favour of cleanliness could not bring himself to face the lodging-houses. The spring night was closing fast, and the air was growing chilly. It had been passably fine all day, but now a cold sprinkle of rain and a keen wind gave a spur to his halting intent. The street they stood in was quite lonely, and lights behind the blinds of the houses made the outer night doubly dreary by comparison with the possibilities of comfort and warmth within.

'Come along, Jack. We'll speak to the next we meet, and ask where we can get a bed.'

A brisk footstep sounded at the end of the darkening street, and they moved towards it.

'If you please, sir,' said Will, and the passenger pausing, looked down upon him, 'can you tell me where we can get a lodging for the night?'

'Where you can get?'—The stranger paused inquiringly.

'A lodging for the night.'

'I do not—know him,' said the stranger slowly. 'What is he?'

'We want to sleep somewhere; we want a bed.'

'A bed? To sleep? Oh yes. Come wiz me.'

By this time Will knew him. It was the stranger who had found him on Scott's Hills on the morning of John's disaster. If it had not been for the change in the foreigner's dress, he would have recognised him earlier; but, whereas, three-fourths of a year ago, he had looked altogether shabby and vagabond, he was now rather a dandy than otherwise, wearing a glossy silk hat and gloves, and carrying an umbrella. He made no claim on his acquaintance, but followed him silently, wondering at the chance, and feeling it to be a little adventurous and spicy.

The stranger walked briskly for a hundred yards or so, and then turned a corner, looking round his shoulder to see if the boys were following. A few yards farther on he thrust open a door which led from the street into a darkened passage. 'Come in.'

Will lingered, not altogether certain that the spice of the adventure had not a flavour of danger in it. A strange town, a lonely street, a dark house, a foreigner! A favourable combination for dealings not altogether favourable to safety.

'Come in,' the stranger repeated.

Will entered, and John followed, holding him by the sleeve. The foreigner closed the door, and left them in the dark. By-and-by they heard him calling: 'Madame! Madame Vigne!'—A female voice answered, in a foreign tongue.—'Pouvez-vous me dire?'—began the foreigner, and then plunging down a set of stairs, he became inaudible. There was a rapid smothered colloquy down below, and for all Master Will

could have told, it might have related to the sauce he and John should be cooked with. He wished he had not had the chance to address a foreigner, and had already formed some dim idea of bolting into the street and slamming the door behind him, when a streak of light appeared, and, a second or two later, a prodigiously fat woman, carrying a candle. She was still young in spite of her ponderous size, and she had a handsome face, so alight with good-humour and kindness that all the boy's vague fears vanished at the first glimpse of it.

Now it happened that Macfarlane's curriculum included a study of the French tongue for such as had parents who were prepared to pay for that luxury as an extra. Will had been a member of the French class for three or four years past; and had so profited by his studies that he had actually been able to identify the only words he had heard in the house as being fragments of the French tongue, and was inspired to conciliate this fat and smiling lady by addressing her in her own language.

'Noo voodrongs on lee,' he said, therefore; and the fat woman, dropping as 'if she had been shot,' plumped upon the stairs and laughed, with the candle held out towards the two young wanderers. She laughed with so extreme an abandon and helplessness that she seemed to hold out the candle in a comically despairing hope that somebody would take it from her; and John stepping forward relieved her of it. But at this she laughed the more; and since neither of the boys had the remotest idea of what it was that so tickled her fancy, they were a little inclined to think her mad. The swarthy-skinned, blue-eyed little foreigner stood by smiling, and the boys stared open-eyed.

'He speaks French, the little one,' said Madame Vigne in her own language, 'with what an accent! Oh, but with what an accent!' She wiped her eyes upon her white apron, and rose breathlessly from her seat upon the stairs. 'Where are you going, you children?' she asked in excellent English, with but the faintest tinge of a foreign tone. 'Where do you come from?'

'We are going to London,' said Will, 'and we want to get a bed for to-night, if you could tell us where, please.' He was not hurt or angry at the fat woman's laughter. Now that it was over, indeed, it seemed to make him more at home with her.

'You are going to London?' she repeated. 'What are you going to London for?'

'We are going to look for something to do there,' Will answered.

'They have run away from home,' said Madame in a rapid aside in her own tongue.—'Where do you come from?'

'From towards Liverpool, ma'am,' said Will, with perfect verbal truthfulness, but deceptive intent.

'Oh!' she answered, taking the candle from John's hand and looking first at his boots and then at Will's. 'You have not worn your shoes much to have travelled so far.—What is your name?'

'William Gregg.'

'And yours?'

'His name is John Vale.'

'He can answer for himself, I suppose.—What

is your name?'—John said nothing, but looked at her in a mild vacancy.—'What are you going to do in London, if ever you get there?'

'I shall take care of him, ma'am,' said Will; and John put a hand through his arm, as if accepting the proffered protection.

Madame Vigne laid her left hand on John's shoulder and turned him round, surveying him from top to toe. Then she went through the same performance with Will. 'They are respectable,' she said then, in another rapid aside, in her own language. 'They have run away from home, the little rogues.—You have money?' she asked a second later, addressing herself to John again.

'We haven't much, ma'am,' Will answered; 'and we must make the most of it.'

'Well,' she said, thrusting open a door which led from the narrow little hall, 'go in there.—Are you hungry?'

'Not very, ma'am,' Will responded.

'Not very,' she answered, hopping to a chair and pulling down a sliding gas bracket; 'but a little.—Very well. You shall have something to eat.—Are you a little hungry too, you boy—you with nothing to say for yourself? Are you hungry?'

'Yes, ma'am,' said John.

'Then you shall have something to eat also.' With that she lit the gas, and hopped from the chair to the floor with great apparent ease, but so heavily that she made the floor shake and the ornaments on the chimney-piece to clatter violently. 'Wait there, and see what I can do for you.—Keep an eye upon them,' she added to her small countryman, and so went from the room with a hop, skip, and jump, in odd contradiction to the massiveness of her figure.

'Be seated,' said the smiling little foreigner with a long pause between the two words, and a momentary triumph at having found the second.—The boys obeyed him, and he, seating himself opposite to them, leaned his arms upon the table and looked from one to the other.—'I have—seen you,' pointing to John; 'and you,' pointing to Will, 'before.'

'Yes, sir,' said Will; 'I know you have. I was very much obliged, sir, and so was John.—This is the gentleman who found us, Jack, the day that you were hurt.—I told him all about it, sir, afterwards.'

'Ah!' said the little foreigner. 'His fazer—where is his fazer?'

'He's dead, sir.'

'Eh, la, la! Zat is bad—bad; oh, very bad. Poor boy! He was good man, his fazer? Not?'

'Oh yes; indeed, he was, sir.'

The little foreigner nodded sympathetically and looked grave. He forbore to question further, but mechanically searching in his pockets, found the materials for a cigarette, and began to roll one with a supple dexterity of the fingers. When it was made he set it between his lips and rose to light it at the gas jet; but at the sound of Madame Vigne's footstep on the stair, sat down again without having done so. Madame appearing with a tray, set it upon a side-table, and proceeded to lay a snow-white cloth, upon which she set a dish of cold meat, a loaf, a jug of water, and plates and knives and forks for two.

'Pitch in!' she said when she had carved a liberal portion for each of the boys; and seeing that Will rather stared at this form of invitation, she dropped into a chair and laughed herself quite helpless. 'I hope that is English,' she said breathlessly as she wiped her eyes with her apron. 'You can understand? Very well. Eat. There is plenty there, and plenty more.'

The boys began to eat, gingerly and delicately, in defiance of appetite, feeling her eyes upon them.

'They are *géné*,' she said, turning away and addressing her countryman. 'They will be right by-and-by, if we leave them to themselves.—You boy, you who speak French, do you know what I am saying?'—Will's stare was certificate enough of ignorance, and she turned round again to her companion. 'They are not quite little gentlemen, but they are respectable. They have run away from home. We must take care of them, and find where they come from, and send them back again.'

'I have met them before,' the little man answered her.—'Did I tell you about the boy with the wounded head?'—Madame Vigne nodded.—'That is the quiet one. The other is the boy who was with him. They tell me that the quiet boy's father is dead. He looked well-to-do, and drove a beautiful horse. He offered me money for watching by the boy; I do not know how much, but a little handful of silver. I was indifferently dressed; I was rambling to sketch.'

Madame Vigne nodded again. 'You must expect to be treated like a beggar if you look like a beggar. You dress yourself to be despised, one would think.—Oh, you are better now.' This was in answer to an appealing odd little gesture which called her attention to his personal appearance.—'You are sure these are the same boys?'

'One of them knows me again,' he answered; 'and I know both of them.'

The fat good-natured woman turned and looked at the young wanderers with a new interest. 'Wait a little,' she said. 'I will not spoil their appetite by questioning them now; but I will find out all about them by-and-by.'

It was noticeable that John did what Will did, and that he kept a watch upon him for that purpose, as if he founded himself upon him consciously or unconsciously, and depended upon him in all things for guidance. When Will pushed his plate away, John followed his example; but they had both done ample justice to the meal.

'You have finished?' asked Madame Vigne. 'You have had enough? You can eat as much as you like.—You will not eat any more? Very well. Now we will talk. Your name is William Gregg, and yours is John Vale. Very well. Where do you come from?—No answer, but John and Will looking uncomfortably at each other and stealing shy glances at Madame.—'Ah! you will not say? Very well. Why did you run away from home?'—Still no answer, but an aspect of increased guilt on both.—'Boys cannot be allowed to run away from home. It is very naughty in boys to run away from home. You must be kept until your friends ask after you, and then you must be sent back again.'

'We're not going back again, ma'am,' said Will

very quietly, but with extreme resolution. 'We can pay for what we have had, but you mustn't stop us, ma'am. If we were sent back fifty times, we should come away again every time.'

He had tied up the four half-crowns Isaiah had given to him and his companion in the same strip of rag with the money he had originally started with, and drawing this from his pocket, he began to unroll it with trembling fingers.

'Oho!' cried Madame. 'Fie for shame! A well-bred boy to offer a lady money. No, no. I did not mean to hurt you; but put up your money and come to me, and let us have a talk.—Now, sit down there and tell me. I will be your friend. I will not be unkind to you. Do you think I am cruel? Now, look at me and tell me if you think I am cruel?'

'No, ma'am,' said Will, looking up, with a fat coaxing forefinger under his chin.

'Very well,' she answered. 'I am not cruel, and I will be kind if you will let me. Now, you must know that you are silly boys to run away from home.'

'No, ma'am,' said Master Will with mighty seriousness, 'we were not silly, really. It was quite necessary, ma'am.'

'Oho!' cried Madame again, 'it was quite necessary? Now, what made it quite necessary?'

'They want to beat Jack every day,' said Will; but this struck him as being so inadequate to the case, and he felt so helpless to explain it all, that he went quite doggedly silent. Madame leaning forward, put an arm about him, and made a motion to draw him towards her. At that he winced and gave a quick short breath, at which Madame released him with a sudden raising of her eyebrows and a glance at her companion.

'Well,' she said, 'you shall go to bed now. You are very dusty and dirty with your walk, and you must wash first.—Come with me, and I will show you where you can sleep.—Go thou, Achille, and find Monsieur Vigne.'

The April shower beat noisily at the window, and the little man raised a hand and made a gesture to indicate it. 'Later on,' he said tranquilly.

Madame lit her candle and marshalled the boys up-stairs into a clean bare little room. There she superintended in a motherly fashion their toilet for the night, kissed them both, and left them to undress, warning them that the candle would be taken away in ten minutes, and bearing their shoes with her, as a precautionary measure against any attempt on their part to escape.

'Madame,' said the little man when she descended, 'permit me to tell you that you are a woman of a thousand. You have a good heart, Madame.'

'Is it to be a woman of a thousand to have a good heart?' Madame demanded.

'Ma foi, yes,' he answered. 'Your sex charms, Madame, and that is so much the worse for us. But the majority of you are not good for much. You are an angel; I admit it, I proclaim it. One woman? Yes. But women? Bah!'

Madame accepted the personal flattery and

impersonal blame with composure, and flourishing from her pocket a piece of knitting, began to work at it. Suddenly she looked up. 'The rain has ceased. Find Monsieur Vigne for me, Achille.'

He got up obediently and went out, returning in the course of an hour in company with a long lean Frenchman of about fifty, a stately man, so withered and dry that he might have been carved out of wood.

'Achille has told you of our little adventure of this evening?' his wife asked him.—He nodded in answer.—'You approve of what I have done?'

'Assuredly.'

'Come with me,' she said, pinching her lips and twisting her jolly face into an expression of mystery; 'I will show you something. But tread quietly; the children are asleep.' She led him to the chamber in which the boys were lying, and having first set the candle she carried upon the floor, softly turned down the bedclothes, and with a delicate womanly hand drew Will's sleeve higher than his elbow. Then she raised the candle and beckoned her husband, who raised his hands and his eyebrows and drew an inward breath.

'The poor little body is so from head to foot,' she whispered. 'I have looked. His face is so. Poor child!' She re-arranged the bed-clothes as I beckoned her husband away.

'Who knows?' said he, turning to whisper on the landing. 'He may have merited it.'

'Jean!' she answered scornfully, 'how can a child of his years have merited that? He has not lived long enough to merit it, if he had been born wicked. It is only these English who treat their children so. If a man of our country did it, the people would tear him piecemeal.'

'There is cruelty everywhere, my dear Mathilde,' said the husband mildly.

'Jean,' said Madame Vigne, thrusting the candle upon him so that she might use both hands in wiping her eyes with her apron, 'if our poor little Hector had lived, and we had died'—

'My dear,' said Monsieur Vigne appealingly, 'why harrow me with these thoughts? Whatever you do, I shall approve it.'

TOOTHACHE CHARMS.

POSSIBLY there is no pain so difficult to endure, and one that meets with so little sympathy, as the excruciating agony of toothache. In Norfolk, the poor sufferer from this malady is, according to the Rev. T. F. Threlton Dyer, jeeringly taunted with possessing the 'love-pain.' Dean Swift has recorded that

A coming shower your shooting corns presage,
Old aches throb, your hollow tooth will rage.

But the 'grim mischief-making chiel' appears to be much more prevalent. During the present age of thriving dentists, and waits not for approaching rain. Shakespeare, however, was evidently acquainted 'with a raging tooth,' or he would never have written,

There was never yet philosopher
That could endure the toothache patiently;

and later, Burns has anathematised this malady

in a poem of six stanzas. There is little wonder, then, that amongst the vulgar and superstitious, all manner of charms have been in vogue to release the victim of this painful disorder from its thralldom. *Æsculapius* is credited with the honour of being the first to advocate the practical cure of having the tooth pulled out; but this severe method soon denudes a mouth of its most useful ornaments. From *Notes and Queries* we learn that the gypsies of Lincolnshire were accustomed to apply a poultice of finely scraped horse-radish to the wrist as a cure for the torture; on the right wrist, if the tooth were on the left side of the face, and *vice versa*. We have also heard of mustard plasters on the elbow, tape fastened tightly round the thumb, and a roasted onion on the big toe. These remedies, ridiculous as they appear, may have had the effect of diverting the nerve-affection to another part of the body.

Among the superstitions connected with this popular disease we observe that recognised saints preside over those afflicted with this disorder. Thus, in the little town of St Blaize, in Cornwall, St Blaize, who was martyred under Lucinius, was honoured, and candles were offered on his shrine for his intervention. A statue is erected to his memory in the church. Bishop Jewel in one of his expositions remarks that St Apollonius was specially invoked for the toothache; and in Foxe's *Acts and Monuments* we find the following quotation:

To Saynt Syth for my purse;

Saynt Loye save my horse,

For my teeth to Saynt Apolyne.

A church at Bonn, on the Rhine, contains a 'tooth of St Apollonia,' which is exhibited on the saint's particular day in a glass case, and kissed by devotees, to prevent the toothache, the priest carefully wiping the dental relic after each osculatory salutation. From Barnaby Rich's *Irish Hubbub, or the English Hue and Cry*, 1619, we extract the following: 'There be many miracles assigned to saints, that (they say) are good for all diseases,' and 'They have saints to pray to when they be pained with the toothache.' In Barnaby Googe's *Poish Kingdome*, in his translation of Naogeorgus, under the head of 'Helpers,' is the line,

Saint Apollin the rotten teeth doth helpe, when sore they ake.

Soutley writes, in his *Life of John Wesley*—a man who had much superstition in his composition—that when his teeth ached, he prayed, and the pain left him.

Many are the charms devised to rid an afflicted mortal of pain in his dental department—curious fancies of the superstitious. Even the Immortal Bard seems to have been aware of their existence, though he causes the contradictory Benedict to doubt their efficacy. Sir Kenelm Digby speaks of the custom of scratching the gums with a nail, and subsequently driving the latter to the head into a piece of wood while the blood is adhering to it. In Scotland, according to Napier, they were not satisfied of the validity of the charm until the iron had entered an oak-tree; whilst the *Dublin Magazine* tells us that in Oldenburg still further details are necessary: the sun must not observe the action, strict silence during the performance is indispensable, and the object is only achieved

when the metal becomes rusty. Some Dublin natives think it expedient to procure a sharp piece of wood, and early in the morning push it into a newly-made grave by the agency of the aching tooth. Another singularly unreasoning remedy is to pare the finger and toe nails, wrapping the superfluities carefully in paper, and placing the parcel in a slit in the bark of an ash-tree. The story is told of an old Rosendale lady performing this feat when a child, and never afterwards being troubled with the toothache.

The belief that the pain is caused by a worm is more natural, and is also mentioned by the Bard of Avon. Some lines we have seen on the subject run as follows :

Ruthless tormentor ! who, with constant gnawing,
Scoops thy dark caverns in my aching grinder
Like mining mole !

Derbyshire folk have an odd way of extracting the supposed creature. A small quantity of certain powdered herbs being placed in a cup, a hot cinder is thrown thereon, and the smoke inhaled by the patient, who afterwards breathes into a glass of water, where they then expect to see the worm. We have been eye-witnesses to a very similar process, the smoke from the herbs being in the interior of a basin, and boiling water immediately afterwards poured into the vessel, the steam from which the operator endeavoured to inhale. Thorpe, in his *Northern Mythology*, mentions an eel-shaped grub as a German belief of the cause of their trouble, for which they possess an incantation commencing,

Pear-tree, I complain to thee
Three worms sting me.

Shortland speaks of the idea existing in China and New Zealand, where an exorcism equivalent to the following is recited :

An eel, a spinyback ;
True indeed, indeed ; true in sooth, in sooth.
You must eat the head
Of said spinyback.

An old lady wrote in a Devonshire newspaper, that when she was a child, her father caused her to bite the back of a snake, he holding the head and tail, as a preventive against toothache. At Churcham, in Gloucestershire, a nurse, with the same object, made a custom of washing a newly baptised child's mouth with a portion of the remaining sanctified water.

A ridiculous idea for prevention is that prevalent in Sussex—the clothing of the right foot before the left with stocking, trousers, and boot. The old fancy of salting a drawn tooth and throwing it into the fire is still known in Scotland. In Cornwall some of the inhabitants expect to obtain an annual release by biting the first fern appearing in the spring.

From an Anglo-Saxon *Leech Book* we cull the following cure for 'jowl'-pain : Burn a swallow to dust and mix it with bee's honey ; to be eaten frequently. The afflicted in Staffordshire and Shropshire must watch a mole-trap, and immediately it is sprung and before the poor animal dies, its hand-like paws are to be cut off ; subsequently, they are worn, a right paw for the right side, and *vice versa*. In Wiltshire it is simply requisite to wear the forelegs and a hindleg of a 'want' (mole) in a bag suspended from the neck.

Those who were troubled with tic douloureux at Stamfordham, Northumberland, were accustomed to walk to Winter's Gibbet on Elsdon Moor, ten or twelve miles away, for a splinter of wood, which they believed would heal their complaint. Some credulous people preserve a double-nut in their pocket for the same reason. Here is a curious remedy : In Denmark, an elder-stick is put into the mouth and taken out and stuck into a wall while saying, 'Depart, thou evil spirit.' Rabelais speaks of washing the tooth with elder-vinegar and allowing it to dry half an hour in the sun. *The Journal of the Archaeological Association* tells of the Christmas images carried about in Yorkshire and decorated with evergreens and flowers, a single leaf from which was a sovereign remedy. The Toothache Tree is an exceedingly small deciduous one, having foliage similar to the ash, and is common from Canada to Virginia. Its name is derived from the fact that the hot acrid bark is largely used for the relief of the pain. The Angelica Tree, in North America, is also styled by the same name as the foregoing. In the Orkneys and north of England the following cabalistic words, are carried about, the former place styling them wormy lines :

Peter sat on a marble stone weeping ;
Christ came past, and said : 'What aileth thee,
Peter ?'
'O my Lord, my God, my tooth doth ache !'
'Arise, O Peter ! Go thy way ; thy tooth shall ache
no more.'

There are many variations of this, and in Berkshire they substituted 'Bortron' for 'Peter.' In Craven and elsewhere, according to Carr, quoted by Halliwell, the gates of Jerusalem and the garden of Gethsemane take the place of the marble stone. One of Ashmole's manuscripts reads thus :

Mars, hurs, abursa, aburse ;
Jesu Christ, for Mary's sake,
Take away this tooth-ache !

A similar charm to the Peter one is used in France for fever. But we have said enough. Many of the above 'remedies' are now obsolete, and those still remaining doubtless owe their efficacy—when experienced—to the virtue of faith and the healing power of nature.

ASTBURY'S BARGAIN.

A STORY IN SIX CHAPTERS.

By CHARLES GIBBON.

CHAPTER I.—A LAST APPEAL.

BEFORE the mid-day train from London Bridge stopped at the Champion Hill Station, a man jumped out, staggered, and almost fell backwards. The porters shouted at him ; the passengers looked from the windows in alarm ; and the guard seized him till the station-master came up. His name and address were demanded with a view to ulterior proceedings for the offence of leaving the train whilst in motion.

The man was a stalwart young fellow, about twenty-eight or thirty ; good-looking, fair, with blue eyes and brown moustache, and whiskers. He was pale, and evidently much agitated, not so much by the danger he had escaped as by other

matters which had induced him to risk it. He gave the required information calmly, producing letters addressed to him and to his employers to authenticate his statements, at the same time expressing his regret for being the cause of so much commotion. His name was Gilbert Astbury, confidential clerk to Messrs Ellicott & Co., ship-owners and ship-brokers, Fenchurch Street, and he resided at Herne Hill. He was at present engaged on most urgent business requiring his speediest return to the City, and that was why he had been so precipitate in leaving the train.

'Well, as no harm has come of it, I daresay you will hear no more about it,' said the station-master good-naturedly; 'but don't try it again, for that was a narrow squeak. I recollect seeing you at this station before.'

'Yes,' rejoined Astbury, smiling faintly, 'you may have seen me alight here many times before. —Thank you. Good-day.'

Clutching a little black leather bag tightly in the left hand and his umbrella in the right, Astbury made his way hurriedly along the then rural footpaths of Dulwich Fields. But he saw nothing of the bright spring verdure—the rich grass and the budding foliage of the trees—around him. At the corner of the old and long disused graveyard near the entrance to the village he turned up a green lane and hurried on, unconscious of the perfume from the hedgerows or the merry chorus of birds busy nest-building. Along the lane were the newly erected mansions of City magnates in glaring red brick pointed with white, and the glass of large conservatories flashed in the sunlight. But there was an ancient farmhouse with black-looking out-buildings and haystacks, round which were cocks and hens, whilst in the meadows cows were browsing on the rich pasture. Here and there, too, was an old-fashioned cottage, standing well back from the roadway, in the midst of a garden where the cultivation of vegetables was combined with that of flowers, and thus preserving some of the rural characteristics of the place. The gaudy and ugly new Dulwich College glared at the passer-by from a little distance; and farther on, the Crystal Palace glistened and shimmered dazzlingly in the eyes.

Before the white-painted gate of one of the old-fashioned cottages Gilbert Astbury halted. It was a modest and comfortable-looking dwelling, clematis, rose-trees, and Virginia creeper striving which should do most to adorn the front and curtain the windows; whilst a vine of many years' growth nearly covered the south, and thick-growing ivy the north gables. A small well-trimmed lawn was bordered with flower-beds, and the gravel path leading to the doorway was smoothly rolled. The kitchen and fruit garden behind the house was, as auctioneers would say, well stocked and productive. One experienced a pleasing sense of neatness and comfort even in looking over the gate, in spite of the gloomy but fine old cedar tree which stood in the centre of the lawn and gave the Cottage its name.

This was the residence of Mrs Silverton, the widow of a medical gentleman who had left her with an annuity of four hundred, an only child—a daughter—and an orphan niece to take care of. The doctor had died at the comparatively early age of forty-nine, and circumstances had not enabled him to amass more than enough to ensure

for his wife the annuity of four hundred which expired with her. Cedar Cottage was, however, her own property; and being a shrewd practical woman, she succeeded in keeping her place in the 'fashionable society' of the district without incurring debt or displaying any sign of undue pinching to make ends meet. Indeed, some people said that she managed to make a greater show with her limited income than many could do with four or five times the amount. She certainly contrived to give her daughter Henrietta ('Hetty') the best education the girl could attain; and the orphan niece, Daisy, had a full share of these advantages.

As Gilbert Astbury passed through the gateway, a young lady, fair, tall, and with soft light-blue eyes, advanced from beneath the shadow of the cedar to meet him. She wore a simple dress of dark cashmere; and her head being uncovered, a mass of silken hair, plainly brushed back and plaited, was visible. The features were somewhat irregular, and yet there was an inexpressible charm in her expression—tenderness and trustfulness were in the eyes and on the soft nervous lips.

'Why are you here at this hour, Gilbert?' she inquired anxiously. 'Has anything been discovered?'

'Yes; I have discovered something which will make me happy or miserable for life. I have discovered something which will save your cousin or destroy her. Is she in the house?'

The girl's lips quivered, her eyes brightened as if tears were nearly forcing their way over the lids, and her whole form seemed to suffer from a sudden chill. But Gilbert was as unconscious of these signs of agitation as he had been of the aspects and voices of happy spring-time whilst coming along.

'Yes. But she is not very well, and—perhaps she will not be able to see you,' answered Daisy with hesitation.

'I must see her—for her own sake,' he responded resolutely as he passed on.

She looked after him with sad eyes for a moment; then she turned away, and with bowed head returned to the seat under the cedar and picked up the magazine she had dropped on seeing him at the gate.

He did not knock at the door, but opened it and walked into the drawing-room. Although the sun was bright, fires had not yet been discontinued for the season, lest stray visitors should find the afternoons chilly; consequently, there was a pleasant blaze in the grate. Finding no one in the room, Gilbert rang the bell, which was answered by a smart parlour-maid, who appeared to be surprised by the presence of the unannounced visitor. 'Please tell Miss Silverton,' he said, 'that I wish to see her on business of great importance.'

'Miss Silverton has told me to say that she is too ill to see any one to-day, sir.'

He took out a note-book and wrote hastily: 'The business on which I wish to see you concerns Dacon as much as myself. I ought to say, concerns him more than myself.' On a writing-table in the corner of the room he found an envelope, and into it he put his brief note. 'Give this to Miss Silverton, please,' he said quietly.

The servant answered mechanically, 'Yes, sir,' and departed.

Whilst waiting her return, he placed his black bag on the table, unlocked it, and taking from it a small packet of papers, began to glance over their contents.

The servant returned in a few minutes with the answer: 'Miss Silverton's compliments, and regrets that she is unable to see you.'

He was bitterly disappointed; but he was too anxious to resent the refusal of an interview, or the cold conventionality of the phrase in which it had been conveyed. Such a response might have been made to a charity collector or a begging impostor, but was altogether an insult to an old friend who had once been regarded almost as a favoured lover. Moreover, as a distant relation of Mrs Silverton, he had been for years regarded almost as one of the family, and treated as if he had been the brother of the girls. He had never before, however, presumed on the freedom which had been allowed him in the house. He presumed now.

'Is your mistress at home?'

'No, sir. She went out after lunch, and said the young ladies were not to wait tea for her.'

'Very well. I am going to write to Miss Silverton, and when I ring, you can take the note to her.'

'Yes, sir.'

He sat down at the writing-table and wrote as follows, without any of the customary formalities of address:

'You must see me for your own sake and his. Proofs of guilt are in my hands, which I will use or destroy, according to the nature of the answer you give me to one question I have to ask. But the answer must be given to me by your own lips—here and now. If you refuse, I go straight to Scotland Yard, be the consequences what they may to me, to you, and to others. You need not fear that I am going to plague you with any reproaches about my disappointed hopes, etcetera—the bitterness and pain with which that "etcetera" is put down here I hope you will never realise. I simply ask you to see me for a few minutes in order to help me to a decision in a crisis which will determine your fate and mine for good or ill. I am ready to bear anything—disgrace, ruin, even the doom of a convict, if I can only save you pain. But you must yourself help me to determine which of the two courses will be the most kindly to you.'

He affixed only his initials to the letter, and having enclosed it in an envelope, he summoned the attendant. She came quickly, for curiosity had prompted her to be close at hand. She took the letter to Miss Silverton.

Whilst waiting her return, he went to the window. He saw Daisy watering and tending the plants in the flower-beds as calmly as if she had no care in the world but them. 'Ay, there is the bliss of life,' was his bitter reflection, 'to care only for those things whose failure to answer our expectations can be remedied by the planting of a new seed or sprig. She does not know what it is to have only one flower in the garden of life—one flower which can never be replaced—and to find it withering in spite of the tenderest care. She will be lucky if she never knows it.'

The door opened and closed. Turning quickly,

he saw Henrietta Silverton. Like her cousin, she was fair; but the eyes were of a deeper blue, whilst the hair was lighter, the features more regular, and at a first glance the whole face more attractive—even beautiful. The lips were soft and ruddy; and yet they had a knack of contracting when she was annoyed, as at present, which gave them a false appearance of firmness. The eyes, too, when the long lashes were lowered, gave an impression of coldness which had really no part in her warm impulsive nature.

'You have forced me to come to you,' she began hesitatingly; 'but it is quite true that I am not feeling well, and I hope you will tell me at once what is this question you wish to ask me, on the answer to which so much depends—as you say.' She could not help the emphasis of doubt laid on the word 'you.'

His first impulse had been to advance and take her hand, but he checked it at the sound of the last three words. 'Everything depends on it,' he answered excitedly. 'The whole happiness of your future—of your mother's and of my future—depends on it.'

'Ask, then, and let me answer,' she said with apparent firmness, as if she had prepared herself for the worst ordeal through which she might be called to pass. But there was a nervous movement of the tapering fingers, as they played with the tassels of her scarf, which belied her courage. 'I count upon the promise in your note that you will confine yourself to this one question.'

He looked at her for a moment sadly and earnestly. He saw that she was really ill, and that it had been no mere conventional excuse which had been offered for her first refusal to see him. He wished he could spare her pain; but it was not in his power to do so. 'I shall be as brief as I can; but you must forgive me for dividing my question into two parts. The first is to me the least important. Tell me, in your thoughts of the terrible suspicion hanging over Henry Dacon and myself, which of us do you believe innocent?'

Whatever degree of trepidation she experienced at the first sight of his troubled face vanished now. There was an indignant flash in her eyes as she gazed at him steadily. 'If one of you two has perpetrated this fraud,' she replied deliberately, 'Henry Dacon is not guilty.'

'I expected that would be your answer; but I am too indifferent to my own fate now to mind it much. I would have liked, however, to know that you of all others had faith in me.'

'I did not say I believed you guilty.'

'You seemed to do so as plainly as words and manner could express your meaning.—But let that pass,' he went on despairingly. 'Here is the second part of my question—does your happiness depend on his safety?'

'My life depends on it,' she replied with a glow of devotion on her face and a fervour in her tone which left no doubt that she spoke from heartfelt conviction.

'Are you sure—quite sure of that? Would nothing make you change your mind?' He spoke with a faint tremor in his voice, as one who is making a last feeble appeal for the mercy

he knows will not be granted. 'Would no proofs—would not even his own words convince you that he has done me a cruel wrong?'

'No!—no proofs would satisfy me that he has done wrong to any man. Even if it were possible that I could have a moment's doubt of the honour of the man who is to be my husband, it would certainly not be inspired by anything you could say or show me. I am sorry that you should have again suggested it, for I was trying for the sake of our former friendship to think better of you.'

'I must thank you for the effort, although it has been unsuccessful,' he commented with a painful flicker of a smile on his now perfectly white face. At the same time he was busy turning over each paper of the packet in his hand, as if seeking some special one.

She was irritated even more by his smile than by his words, although they in her ears contained a sufficiently insulting sneer to rouse her indignation. But the smile she regarded as one of contempt—never thinking that acute pain was the more probable cause of it—and she spoke angrily.

'Even supposing you are blameless in this dreadful business, do you think I do not understand the motives by which you are actuated in attempting to dishonour Henry in my eyes?—You who should have been the first to defend him!'

'And wished to be.'

'Do you think I can forget, as you have done, that you owe him everything—your rapid promotion—your prospect of a partnership in a firm in which, but for his noble generosity, you might have gone on for years earning the wages of an ordinary clerk?'

'I have not forgotten anything he has done for me, and I am grateful,' said Gilbert huskily as he pulled out the document he had been seeking. 'I came to London with no better prospect of being speedily able to earn a living than thousands of others who arrive daily without friends or introductions. I had only two chances—the first that your mother might, on the strength of my distant kinship, recommend me to some one who could give me employment; the second, that my old schoolfellow Henry Dacon might in his proud position still remember me and help me. He did remember me—you did not know him then—and he did help me. He did more for me than my vainest expectations could have looked for. He helped me to a situation at once; by his assistance I won in a few years the position which gave me the right to think of you and even to speak to you—you did not know him then.—Oh, I remember all, and I am grateful.'

There was such a mingling of sadness and bitterness in his tone that it was impossible to divine which element predominated. He made no reference to the fact that his own ability had early attracted the attention of Mr Ellicott, the head of the firm, and won the rapid promotion which no influence unsupported by merit could have secured for him. As he finished speaking he unfolded the paper he had taken from the packet and appeared to read it.

'And you show your gratitude,' she exclaimed with increasing resentment, 'by this new attempt

to degrade him in my eyes! You do this—you, Gilbert Astbury—you who pretended to care for me so much that my happiness was your first concern in life—you who pretended that to ensure my happiness there was no sacrifice that you would not make. This is how you show the truth of your fine words—by making me miserable because I have chosen him instead of you.' She was conscious that in the presence of his apparent calmness her outburst of passionate reproaches was a sign of weakness, and she was ready to cry with vexation at her inability to control it.

'One word more,' he said earnestly. 'Suppose it should be proved that he was guilty'—

She interrupted him with a cry of rage, and turned to the door. Passion again banished all weakness. 'Even if all the judges and juries in the land found him guilty of the greatest crimes and sent him to a felon's jail, I would still believe him innocent. I would wait for him ten—twenty years, and be the first to meet him when the prison gates were opened for him, and offer him my hand. I would try with all my life's affection to comfort and to help him to forget the degradation which he had been wickedly condemned to endure.'

As she made this declaration there was something strangely, almost startlingly beautiful in the fair face with the halo of impregnable, undoubting love upon it. To win such a love as that what would not any man give?—to be worthy of it, what would not any man sacrifice? So thought Gilbert as he carefully tore into fragments the paper he had taken from the packet, whilst he moved towards the fireplace.

'Do not go yet—stay only a minute. I am going, and you are not likely to see me again.' He was dropping the fragments of paper into the fire as he spoke, and they made a merry blaze which seemed to mock at his misery. When the last bit had turned into a black film and a draught from the partly opened door had whisked it up the chimney, he replaced the packet in his bag. 'There is no more to say. Good-bye.' He was at the door, holding out his hand; but she drew back, startled by his abrupt manner, and he misunderstood the movement for one of refusal to take his hand. 'Good-bye,' he repeated hastily. 'God bless you; and may you never have cause to be sorry for the answer you have given me to-day.'

The outer door had closed behind him before the dazed girl could recover from the bewilderment caused by his words and conduct. The burning of that paper with so much care and deliberation had perplexed her sorely; and rousing herself, she darted to the fireplace to see if any scrap remained on which might be found some legible words to give a clue to the meaning of his action. But the work of destruction had been too thoroughly accomplished to leave the faintest trace of what the paper had been, or what had been written on it.

Then the girl sat down and cried. Angry as she had been with her visitor, she was sorry for him, because she liked him. He had been a trusted friend and companion; and he had introduced Henry Dacon to her. Naturally, too, she had a kindly regard for the man who had wished to marry her, and who, until quite

recently, had borne his rejection patiently. But she could not help his disappointment when he discovered that she liked Dacon so much as to prefer him before all others as the man to whom she was ready to entrust her future. It was not her fault that she should prefer him. Love was not a fault, and could not be got up to order. Can love be regulated in its growth to suit convenience, prudence, circumstances, and climate? All history and fable answer—'No.'

But Gilbert had been a dear friend, and he was now under a very dark cloud. She would have liked to show her sympathy for him—would have been glad to speak any comforting words of hope at her command; but his conduct in attempting to shield himself from blame, as she fancied, by accusing his friend had closed her mouth and suppressed the sympathy she would willingly have given him. And now, when he had vexed and worried her almost beyond endurance, she could not help feeling sorry for him—he looked so very ill when he said: 'God bless you; and may you never have cause to be sorry for the answer you have given me to-day.'

The words, the burning of the letter, and his manner, bewildered and distressed her exceedingly. So she could only find relief in tears, and wish that Henry would come soon to help to explain Gilbert's mysterious behaviour. Of course, whilst speaking to him and in her rage, it had been all plain enough: a rejected lover was simply doing his best and worst to oust his rival from the first place in her regard. But now that he was gone, and she could remember the many traits of a brave, upright, generous nature displayed by Gilbert during years of friendly intercourse, in which, if there had been evil in his character, some sign of it must have been manifested—now, when she remembered this and could think over it, she could only feel bewildered and sorry for him.

The source of all the trouble lay in the recent discovery that a series of gigantic frauds had been perpetrated on the firm of Ellicott & Co., the extensive ship-brokers and ship-owners. No one had been yet directly accused of the crime; but investigations were in progress, and suspicion pointed to one of two persons, because they alone seemed to have it in their power to perpetrate the frauds. Henry Dacon, nephew of Mr Ellicott, the head of the firm, and a junior partner, and Gilbert Astbury, the confidential clerk, were the only persons in England who had the right of access to the documents and information, the possession of which rendered the frauds possible.

The position of the first named seemed to place him beyond suspicion; and little doubt was entertained as to who the real culprit must be. But John Ellicott, in his seventieth year, was still a clear-headed, strong-willed man, and sternly just. He would pronounce no opinion: he would accuse no one until the proofs of guilt had been fully collected. Therefore the investigation proceeded without any arrest being made, and the two suspected persons were presumed to be giving their utmost aid in its prosecution. The assistance of the police had not yet been called for, as Mr Ellicott desired to avoid fuss and scandal until he could say: 'There is the forger—arrest him.' He was the more strongly moved to this

course as there was a bare possibility that a third person might be involved in the crime, and that person was the most important and most trusted of the foreign agents of the house. The possibility was so very remote, however, that his name was not mentioned.

At Cedar Cottage the terrible cloud which hung over them had been talked about in confidence by Dacon and Gilbert. Naturally, it produced the greatest anxiety and excitement in the breasts of the three ladies, who had so far carefully preserved the secret from their most intimate friends. There were, however, mysterious rumours in the City and mysterious paragraphs in the money articles of the leading daily papers which at length so clearly indicated the house of Ellicott & Co. that the crisis was at hand when the whole transaction must become public and pass into the hands of the police.

It was at this juncture that Gilbert paid his hasty visit to the Cottage, and left it with that look of absolute despair which only appears when a man knows that his doom is sealed, and that no earthly power can save him from utter ruin and disgrace.

He did not observe Daisy put down the watering-can and advance to meet him as he was walking blindly towards the gate. She was frightened by his expression, and clasped his arm with her soft hand. 'You are very ill, Gilbert,' she exclaimed. 'What has happened?'

He smiled faintly as he took her hand, pressing it gratefully; for there was no mistaking the depth of the girl's solicitude on his account. 'Little more has happened than I expected, Daisy; and yet that little makes all the difference in the world to me. You will not see me again—or if you do, it will only be to shun me and feel ashamed that you ever called me your friend.'

'I shall never feel that,' she responded quietly; 'and you ought to know it. Whatever misfortune may happen to you it cannot alter my regard for you.'

'I believe you think so now,' he said with a melancholy movement of the head; 'but you do not know—you cannot guess what you will soon hear about me. All the same, I wish I could thank you as I would like to do for the comfort your words give me.'

'I won't believe anything I hear about you if it is bad,' was her decisive comment, and with shrewd instinct she went straight to the point: 'You have persuaded Hetty to see you, and she has been unkind to you. So you are in the dumps, and fancy that all the world is against you. You have been bothered and worried about this nasty business in the City. You have got ill over it, and consequently you are looking at everything through a false glass which distorts the appearance and meaning of all that you see.'

He smiled again faintly. She was so much in earnest in her endeavour to cheer him that she helped him more than she could have imagined to bear the heavy burden he had resolved to take upon himself. They were standing under the shadow of the cedar tree, and his voice was full of subdued emotion.

'Thank you again, Daisy, for what you have said. I shall remember the words all my life

—they will always be the most precious memories of this bitter day. Good-bye.'

Although he uttered the last word in the manner of one who is taking leave of a dear friend for a long time, Daisy refused to accept it in that sense. So, with affected confidence, she inquired: 'When are we to see you again?'

'I do not know—maybe you will never see me again.'

'Are you going away anywhere?'

'Yes; I start this afternoon on what will probably be a very long journey. I do not yet know what my destination is to be.'

'But you will write and tell—aunt?'

'There will be no letters,' he answered gloomily.

'I think you are trying to frighten me, Gilbert,' she ejaculated with a shade of impatience, as they parted at the gate.

She watched him hurrying down the green lane, and fancied that his steps were somewhat unsteady, as if from exhaustion. At the old graveyard he halted, looked back, and seeing Daisy, waved his hand. Then he turned the corner and was out of sight.

STATION-MASTERS.

BY ONE OF THEM.

THE position of a station-master is not arrived at in a day. The average number of years for which a man has to work before he attains this post is about twelve. There are men, and many of them of great practical experience, who have been aiming at this position for twenty years or more, and have not reached it yet; and may never do so. It is the same on railways as in the army, navy, and the professions: influence, to some extent, is almost indispensable; and though men of marked ability have risen in the railway service by virtue of their own merit, still these instances are few and far between. Soldiers and sailors cannot all be generals and admirals, neither can every railway servant become a general manager. The French soldier is taught to believe that he carries a marshal's bâton in his knapsack; so might every railway man be taught that the seal of a general manager is within his grasp. If these honours are never attained, both services will profit by the energy displayed by the members in attempting to attain a position that is held by very few men within half a century.

Simple though the duties of a station-master may appear, yet only years of experience can make him equal to his work. He has often to give orders and decide points which, without the necessary experience, would cause him to be in constant trouble. The ability to cope with his work has grown with him, and it is seldom that he proves incompetent in that respect. There certainly have been men appointed to this position who have been unfit for the post through want of knowledge and experience; but it is the same in almost every occupation. There are favourites at every court, and they can also be found in all grades of life down to the workshops, and their promotion has to be submitted to, whatever their abilities may be.

Into the ears of the station-master are poured all the grievances of railway travellers. He has to hear insult levelled at the Company which

he has the honour to represent. The wrath of the 'commercial' who has missed his connection with a certain train is poured on to this official's head, who for the time being is the Company, and who for the time being wishes he had not the honour of serving. Railways, like many other corporations, become fair game for the public to swindle and abuse: the abuse can be borne; but even railways show fight when they are being 'done'; and were it not for the sharp justice dealt out at police courts, railway investments would be about as lucrative as South American or Turkish bonds.

Station-masters are generally divided into three classes according to the importance of the station; but even then there is a great difference in the position of men belonging to the same class, so that six classes would show more correctly their relative position. From the highest to the lowest station is a very great fall. York and Birmingham are two of the largest and most important stations in the provinces, and Darlington in Yorkshire is probably the smallest. The station-master at the latter place is signman, porter, and booking-clerk combined; and the offices and waiting-room used to consist of one hut not much larger than a bathing-machine, and might have been carried away bodily by two or three men. Yet the official who represents the Company at this station can rub shoulders with his swell confreres at the two large stations mentioned. He of Darlington is as much station-master as the others; and he knows when his orders are executed and when his work is done, and he accepts his wages with an easy conscience. At large stations, there is often a deputy or assistant station-master, who of course will have all the hard work to do; while his superior looks on and walks the platform as a captain does his quarter-deck. The deputy will give all orders to the men, having first received them from his chief, who is the responsible head of the station, which includes booking-offices, parcel, left-luggage, and telegraph offices. He also has a certain amount of control, as far as order is concerned, over refreshment rooms, lavatories, and cab-stands. He has no power to dismiss any servant of the Company, but can suspend them, which means that the servant so suspended ceases work, and does not resume it till his case has been considered by the superintendent of the line, who may fine or dismiss the person offending, as he thinks fit. Suspension is therefore the great deterring power in a station-master's hands. During the time that this edict is in force, the man's pay ceases, so that even if he is reinstated without a fine, he loses a considerable sum, as his case is hardly likely to be dealt with within a week.

To the general public, the station-master at large stations is unknown, and it cannot be said that his life is the common one belonging to this class. We must go to smaller stations to see the typical station-master. There he may be seen at all hours, and on all days attending personally to the trains as they come and go. He may be proud or affable, liked or disliked; but he is sure to be known, and it is to him that all travellers go when misfortune overtakes them. A person meeting with an accident, or a passenger being taken suddenly ill at his station, is under his care. If there is a drunken

row in a carriage, the guard appeals to him, and he decides what is to be done. A passenger is over-carried; he hears the case, and sends him back, or makes him pay the excess fare. An old lady losing her luggage appeals to him for his assistance to find it for her, but not always in a lady-like manner. At junctions, his greatest trouble is to decide whether connections are to be maintained when trains are running late. He may have certain instructions what to do, but they do not cover all contingencies, and his decisions may not always meet the approval of his superintendent; he will in that case get a letter, which will say just enough to upset him for a day or two, and everything will appear to be going wrong, for troubles do not come singly, not even on a railway. Besides his own mistakes, he is held responsible in a great degree for those of his staff. A stupid booking-clerk, who cannot or will not book passengers by right routes, will cause some more cutting letters to be received from headquarters; and if the station-master is a sensitive man he feels these rebukes; but, as a rule, his skin is pretty thick; and thick it will have to be if he intends to enjoy life under the usual conditions of the service. His time is never his own, at least theoretically, for he is not supposed to be absent from his station without leave; and even those hours claimed for sleep are sometimes surrendered to the service of the Company. A knock may come at his door in the small-hours of the morning, and a voice will call out: 'Up express off the road at Rolten Siding; both lines blocked, sir.' From his bed he will have to rise, whatever the weather may be, and act as pilot till the road is clear, or till some other official comes down to take charge. Some station-masters have had this sort of summons three times in one week; and when it is borne in mind that his wages cover all these extra duties, it cannot be said that his office is a sinecure.

As a rule, the station-master is not a grumbler, and lives and works in the hope of promotion—a hope that is often deferred, and that has often made his heart sick. Yet with all the petty annoyances he may have to suffer from the public, and the disagreeable letters he may get from headquarters, the life of a station-master may be a pleasant one. The peculiar excitement which most people feel who are travelling for pleasure is unknown to him; but in their outgoings and incomings he finds a source of great interest; and if he cares to study the phases of human life or character as depicted in the human countenance, he has on his platform daily the chance to do so. Strange faces pass him hourly, faces that linger in his memory for days together, and others that are no sooner seen than they are forgotten. To-day, a wedding party will occupy his mind; to-morrow may see his platform filled with mourners. Picnics, school-parties, partings and meetings of children with their parents, are ever engaging his attention, and the mutability of life is ever being brought to his notice. His life is a kaleidoscope, and no two days are the same. At times he may be curt and snappish, and so are we all; but as a rule he is affable, though perhaps a little distant; but no more should be expected from him than from any other public servant.

A house is generally provided for station-masters rent free, which also includes coals and gas. These houses, as a rule, are well built, but with no pretence to architectural beauty; a garden is often attached to them; but where there is not one, the adjacent embankment is brought under cultivation. On some of the lines, notably those running south of London, horticulture at the stations is encouraged, and prizes are given for those that are most ornamental and attractive. Of course a great deal depends upon the station itself, for some of them would defy the power of a Sir Joseph Paxton to beautify. The lines running north of London depend chiefly on the goods and mineral traffic for their dividends, and the appearance of stations then becomes a very secondary matter.

Gardening is perhaps the chief outdoor recreation of the station-master; he has no time for cricket, football, or angling; and even his walks must have a limit, for he must be near his station at all times, in case of emergency. But if he is somewhat of a prisoner in the summer months, he is better off in the long winter evenings; for though he has to be on the spot, he can finish his work when he likes, and indulge in the comfort of his own fireside to his heart's content. Many of them are well-read men; but a genius in literature has not yet appeared among station-masters, unless we can claim Patrick Brontë, brother of the immortal Charlotte Brontë, as one of us. He was for a time a station-master on the Lancashire and Yorkshire Railway; but his restless spirit could not exist in the monotony and confinement inseparable from a small country station, and he ultimately broke the bonds of discipline only to return home and go from bad to worse. There he ended his wild career in an early death, amidst scenes sorrowfully described by his sister Charlotte, who, though so good herself, could yet love and pity her erring brother. Had he lived and reformed his character, English literature would undoubtedly have been enriched by his pen.

Station-masters have risen to the highest office on a railway, and though with some men this position may be considered the end of their promotion, with others it is but the beginning. It is the first step in which a man comes in actual contact with officers of the executive, and his abilities become known to those who can further his advancement in the service. Many appointments in the colonies are open to him, as nearly all the executive officers of our colonial lines are filled from the home railways. As a class of men, station-masters may be said to live to a good age; there are many between sixty and seventy years of age who are in active service; but as a superannuation fund exists on most lines, they are expected to retire at the age of sixty. After a lifetime in the service, the peace and quietness of retirement is not always appreciated, and many of them leave their old surroundings with a miserable feeling of having nothing to do. They will go daily to the railway station, and each visit impresses more and more upon their mind the fact that they no longer belong to the service; they feel their position, and this feeling becomes, a disease. It is noticed that they have not visited the station for some time, and inquiry makes the reason

known. They have taken to bed, worn out with the trouble of having severed their connection with the railway and having nothing more to live for. That they have arrived at the terminus of their life's journey is the next and last thing that is heard of them.

MY PET.

If you were asked, reader, to guess what my pet is, or rather *who* he is—for he is, I hope, important enough to admit of my dispensing with the neuter gender—I am sure you would not succeed in guessing. Well, then, I may as well tell you that he is a small orang-outang, or what should perhaps be more correctly termed a 'gibbon.' There are not a few who do not know what a gibbon is. Let those in ignorance of what a funny little animal he is, turn to that entertaining work called Wood's *Natural History*, where they will find the gibbon most accurately described. At the time, however, that the work alluded to was written, the gibbon of the island of Hainan (in the China Sea) was unknown, and is not therefore described in it. The white-faced gibbon of the Straits is mentioned; but his jet-black relative with bushy hair and handsome face was left out. What a true prize a black gibbon is! Most affectionate in his nature, possessed of a pleasing voice and winning ways, he is truly a good companion.

My office, in the last port where I was stationed, looked over the sea, and had a veranda outside it, which of course was kept sacred. I was sitting one day in my office-chair, looking out over the bay beyond, to collect my thoughts for a despatch then in hand, when I espied a Celestial coming along the veranda with some dark object in his arms, the dark object showing its appreciation of the attention it was receiving by placing two arms of inordinate length round the man's neck. I naturally rose up to see what this phenomenon was, and having been told that it was a rare animal, I at once made overtures for his purchase. As soon as negotiations were concluded, I fastened my purchase—a black gibbon—to my copying-press, instead of sending him up to my house, being anxious to introduce him myself to my two dogs and to Joseph the cat. I could not entrust a rare animal to my servants, lest the introduction through their agency to Joseph and the rest might result in some disaster. When I fastened the gibbon to the press, I took no account of the length of the animal's arms, and I was therefore not a little surprised when a black hand took possession of a red-and-blue pencil and a black mouth began to eat it. Nature is said, in her beneficence, to instruct the lower animals what to eat and what to avoid. That no doubt applies to an animal in the wild state, such animal being directed by instinct where to find an antidote to anything deleterious which it may have eaten. An animal in captivity must, however, be treated differently, and must not be allowed to do as it likes. So I reasoned; and as I had no herb ready to correct the evil which I knew would result from eating a pencil, I proceeded to recover the stolen article. Though my new pet did not mind being touched, though he would jump into your lap and make himself at home, he strongly objected to part with anything which he had once got hold of, and a

good deal of diplomacy had to be used before I repossessed myself of the pencil.

Scarcely was this fun at an end, before some black fingers were dipped into the ink; and when the ink was removed out of reach, the gum-bottle was next turned over, the gum being particularly appreciated. Thinking that the animal might be thirsty, I put a saucer of water before him; but though easy to put the saucer down, it was impossible to pick it up again, even though there was not a drop of water left in it. It seemed to me, on reflection, that I had made a bad purchase. I did not clearly see how I was to feed an animal that was so intractable, and I had serious misgivings that my new pet would give me a lot of trouble, and quite likely would die in three months. Monkeys are generally supposed to be troubled either with heart-disease or with consumption, and to endure captivity for a short time only. Thus, I had given my gibbon three months to live, and I fully expected that before four months had passed he would be under a glass case in my drawing-room. I am extremely pleased to say that, at the time I write—more than two years since I purchased him—he is still alive, though I must confess it has not been easy to rescue him from the jaws of death on several occasions.

At first, the name of 'Sambo' was given to the gibbon, on account of its jet-black colour; then this was changed in course of time to 'Samuel,' the little fellow becoming too respectable to be called Sambo. At the last port at which I was stationed, the lower windows of my dwelling-house were provided with iron bars—about five inches apart—as a protection against thieves. These bars were a great convenience to me, as I could attach Sam to them at meal-times, thus keeping him out of mischief whilst giving him plenty of freedom. The question of feeding Sam was not an easy one to tackle. If we sat down and began eating before he was served, the most noisy protests were made; and when the saucer of rice was put down, there was no one courageous enough to recover the empty saucer. The point was often settled by Sam himself, who, having finished his rice, would throw the saucer into the air a few times—catching it very cleverly—and then hurl it away from him. A wooden bowl was found to answer better; but this also received much rough usage, and had to be repeatedly renewed.

One very noticeable feature about Sam was his extreme jealousy. If I stroked the cat in his presence, he used to get into a paroxysm of rage and make great efforts to bite me. He would be almost as much vexed if I patted the dogs. When a guest came to luncheon, he was so angry at the intrusion that he often had to be removed. He would absorb all the conversation until removal, it being quite impossible to keep him quiet. He had a singular objection—he has it now in a mild way—to anything being removed by the servants; and had he been fastened to my chair instead of the window, no plate once put on the table could have been removed. When in the drawing-room with me—and he was often there—he would even fly at my wife if she attempted to touch the tea-things. At this date he has sobered down a good deal; but even now, though a servant may bring me a letter, he must not take away a reply if 'Sam

is with me. He objects to any one coming near me; and if my wife shakes my coat, or even touches my shoulder, he catches hold of her, though now perhaps more in play than in anger.

His disposition has naturally changed during his long captivity, and I am therefore obliged to speak of his actions in the past tense. Sitting up, Sam measures sixteen and a half inches; but his arms are twenty-three inches long. He is jet black all over, has fur as thick as that of many animals which live in cold climes, and the hair on the top of his head grows up into a point, which naturally enhances his personal appearance. His nose is flat, and is doubtless more useful than ornamental. He has a good voice, and whether he calls out for his food or expresses his delight at seeing you, his notes are equally agreeable. When I take him his bread and milk at half-past six every morning, he shows his gratitude in a queer way: prostrating himself, he makes what no doubt are eloquent speeches in his own language. After he has spoken for some time and made numerous faces, he takes hold of my hand and hugs it. Until he has gone through this elaborate performance, he will not touch his food. Though his diet should consist of rice and fruit only, he often has bread and jam, and too often a slice of cake. He has no objection, moreover, to either rice-pudding or plum-pudding. When his appetite shows signs of weakness, an egg beaten up in milk revives him; and symptoms of fever call for a little quinine mixed with sugar. I never give Sam tea. Tea makes such animals nervous, and has other deleterious effects on their constitutions, which need not be particularised here. Orang-outangs taken to Britain are generally dosed with tea on arrival, and are given an inordinate quantity of fruit to eat. Very little fruit is required, and care should be taken not to give too much water. In their wild state, gibbons no doubt eat a large quantity of fruit; but then nature comes to their aid if ill effects arise, and points out to them the herb which will cure them. In captivity, they do not get much exercise, and science can do very little for them when bodily ailments occur.

If Sam breaks loose in the summer, he helps himself liberally to bananas: if his rope gives way in the winter, he makes his way to the drawing-room; there he warms himself, and having done this, he jumps on the sofa, pulls an anti-macassar over him, and goes to sleep.

When I go into the garden, I release him altogether. He jumps from tree to tree, to the great amazement of the Celestials, who watch his movements from hillocks outside my grounds, and occasionally he comes down to have a game with my two pups. It is not a common sight to see a gibbon loose, nor can you always get a picture of a gibbon and a dog rolling over and over each other in play. Perhaps some of my readers may at one time or another have kept gibbons. If they have, they must have been struck with the singular way in which gibbons quench their thirst. The young gibbon does not put his mouth to the water when he wants to drink; he dips his left hand into it and sucks the back of his fingers, the hair which is on them taking up about half a teaspoonful of water at a time. As he grows older, he shakes off this youthful folly, and then

dips his head into the water and sucks the fluid up in the same way that a horse does. What the gibbon lives on in his native wilds it is impossible to say; but he evidently has a predilection for spiders' webs. My pet clears away all webs within his reach, and not liking to leave the owners of them homeless, he devours them too. He is very fond of hard-backed beetles; but these delicacies are now strictly forbidden, as they are not calculated to agree with bread and jam or with rice-pudding.

It was not an easy matter to keep Sam alive in the tropics: now that he is not only well out of the tropics but in a region where the winters are severe, one may well despair of being able to preserve him. During the twenty-seven months which he has now spent with me, he has been my constant companion. He went with me to the office when I was in the south of China: he goes with me now that I am in the north. In the south he used to pull the hats of my chair-coolies off: here he continues this play, varying it by pulling my hat off and throwing it out of the chair. At the office he constitutes himself my special guardian, making strong protests against any one approaching my desk. He will allow a stranger to go up to him and scratch his head; but he makes the noisiest demonstrations possible if any one ventures to shake hands with me or touch anything on my desk. If I leave my house in the morning without him, he speedily lets me understand how sore in spirit he is, and I have eventually to take him. Sometimes I am reluctant to take him, as he pulls things about at the office, and on the way to the office he swoops down on any fruit which may be within range. If he captures a pear or an apple, he returns with it to the sedan-chair in great triumph, showing as much pleasure in his face, and making as much noise as a child does when given a piece of cake of more than ordinary richness or a lollipop of extra quality. I am so well known here, that itinerant fruit-vendors know where to apply for compensation for thefts committed. There is no ill feeling created; indeed, there are roars of laughter when the 'black monkey,' as they term Sam, makes a good seizure. I have to keep a string of 'cash' at the office to pay for Sam's depredations.

SOME SOCIAL SLIPS.

'I beg your pardon, madam, but you are sitting on my hat,' exclaimed a gentleman. 'Oh, pray excuse me; I thought it was my husband's,' was the unexpected reply.—In another instance of conjugal amenities, a wife said to her husband: 'I saw Mrs Becker this morning, and she complained that on the occasion of her last visit you were so rude to her that she thought she must have offended you.' 'Nothing of the kind,' he answered. 'On the contrary, I like her very much; but it was rather dark at the time, and when I entered the room at first I thought it was you.'

'Poor John—he was a kind and forbearing husband,' sobbed John's widow on her return from the funeral. 'Yes,' said a sympathising neighbour; 'but it is all for the best. You must try to comfort yourself, my dear, with the thought that your husband is at peace at last.'

A gentleman had accompanied a friend home to dinner, and as they seated themselves at the table, the hostess remarked: 'I trust that you will make allowances, Mr Blankley. My servant left me very unexpectedly, and I was compelled to cook the dinner myself.' 'Oh, certainly, my dear madam, certainly,' responded the guest with great emphasis: 'I can put up with anything.'

Another amusing slip took the form of an unhappy after-dinner speech. There was an entertainment given by an earl deservedly popular. It was extremely handsome, and champagne flowed freely. The evening was well advanced when a benignant old gentleman rose to propose a toast. He spoke with fluency, but somehow he said exactly the opposite to what he meant. 'I feel,' said he, 'that for a plain country squire like myself to address this learned company is indeed to cast pearls before swine.' Never was so successful a speech made. He could get no further for many minutes. The company applauded vociferously and as though they would never cease.

'Now, Miss Brown,' said an earnest listener, 'won't you play something for us?' 'No, thank you,' said the lady; 'I'd rather hear Mr Jones.' Earnest Listener: 'So would I, but'—Here he was stopped by the expression on the young lady's face; and he looked confused for half an hour after she had indignantly turned and left him.—A person who was recently called into court for the purpose of proving the correctness of a surgeon's bill, was asked whether the doctor did not make several visits after the patient was out of danger. 'No,' replied the witness, 'I considered the patient in danger as long as the doctor continued his visits.'

A physician walking with a friend, said to him: 'Let us avoid that pretty little woman you see there on the left. She knows me, and casts on me looks of indignation. I attended her husband.' 'Ah! I understand. You had the misfortune to despatch him,' was the remark that slipped out. 'On the contrary,' replied the doctor, 'I saved him!'—A guest at a country inn exclaimed: 'I say, landlord, your food is worse than it was last year!' 'Impossible, sir,' was the rather ambiguous reply of the landlord.—'Why,' said a counsel to a witness, 'are you so very precise in your statement? Are you afraid of telling an untruth?' Witness (promptly): 'No, sir'—At a recent inquiry into the sanity of a young man of large property, witnesses were being called to prove that he was unfit to manage his affairs. A curious slip was made by a schoolmaster when asked if he had formed any opinion as to the state of mind of the alleged lunatic. 'Oh yes,' he replied: 'I can certify he is an idiot. He was one of my favourite pupils.'—'I have met this man,' said a lawyer with extreme severity, 'in a great many places where I would be ashamed to be seen myself;' and then he paused and looked with astonishment at the smiling court and jury.

Here are a few other instances of something very like putting one's foot in it. The legislature of a Western state having a bill under consideration for the regulation of tax collectors, an honourable member got upon his feet and said: 'Mr Speaker, I go in heavy for that bill. The tax-collectors are all a set of knaves. I was one myself for ten years.' The bill

passed.—'How are you getting on in your new place?' asked a lady of a girl whom she had recommended for a situation. 'Very well, thanks,' 'I am glad to hear of it,' said the lady. 'Your employer is a nice person, and you cannot do too much for her.' 'I don't mean to, ma'am,' was the innocent reply.

Here is a naive declaration from the prospectus of a weekly paper: 'The staff, with the exception of the editor, has been very carefully selected, and deserves to secure success.'—A Californian newspaper is said to have been sued for libel by a widow for speaking of her deceased husband as having 'gone to a happier home.'—'Dear sir,' said an amateur farmer just from the country, writing to the secretary of an Agricultural Society, 'put me down on your list of cattle for a calf.'—A certain caravan orator at a fair, after a long yarn descriptive of what was to be seen inside, wound up by saying: 'Step in, gentlemen; step in! Take my word for it, you will be highly delighted when you come out.'—'Allow me, madam, to congratulate you on your acquaintance with that charming lady,' said a gallant Hungarian; 'she is young, beautiful, and intelligent.' 'Oh, certainly,' replied the lady. 'But don't you think she is a trifle conceited?' 'Why, madam, just put yourself in her place, and say would you not be conceited too?' was the rather startling comment.

This social slip is even worse. A City man complained bitterly of the conduct of his son. He related at length to an old friend all the young man's escapades. 'You should speak to him with firmness and recall him to his duty,' said the friend. 'But he pays not the least attention to what I say; he listens only to the advice of fools. I wish you would talk to him.'

DIFFIDENCE.

Mr lady sits beside me, and her eyes
Are deep with distant thought;
From pearl-strown Persian sands a richer prize
No diver ever brought.

For Love is purified by suffering;
The chambers of her soul
Have held the meaning of the tides that bring
Death's galleys on their roll.

Would that I heard the music of her speech!
Still in her silence she
Can teach what Wisdom's voice could never teach,
Were that to tutor me.

For Love himself is warder of the gate
That leadeth to her heart;
He oped the door for me, and there I wait
Till she bids me depart.

Planet and star rise clear and strong above;
Grant, Heaven, they be not all
The lights of the chapelle ardente of Love
Before his funeral.

CONFLICTING VIEWS OF HISTORY.

'HISTORIES,' says Bacon, 'make men wise;' and by 'wise' he probably meant sound in judgment, comprehensive in view, prudent in the ordering of one's own life. The famous saying of Archbishop Usher is to the same effect: not to know the past is always to be a child. 'History,' says Dryden also, 'is the most pleasant school of wisdom.' These judgments probably record the general opinion of the educational value of history; yet from this opinion there have always been eminent dissentients. Locke, and in our own day Mr Herbert Spencer, are far from having such a high opinion of the value of history, and assign it but a low place in their scheme of studies. At first sight it seems strange that difference of opinion should be possible on such a subject. It is from the experience of his own past that the individual learns the wisdom wherewith to direct his steps; and it seems a natural conclusion that the race as a whole should learn its lesson on the same terms. The artist, whatever be his originality, can but order in different relations materials already in his hands. So in the most revolutionary of social or political movements, the past is in reality directing and controlling all. For every deed of the French Revolution, a precedent can be quoted. If the past, therefore, be thus everywhere and always present, can there be a better school of wisdom than the records which will faithfully represent to us the actors and doings in that past, at once the parent and the schoolmaster of the present? Put in this simple fashion, the question admits but of one answer. Locke and Bacon would certainly not have disagreed thus far.

Unfortunately, however, the question does not admit of such a simple solution. Since history began to be written, men have been unable to agree as to what it is in the past that best supplies the lessons we seek. They have even differed as to the best methods of presenting that lesson when it has been found. The matter and the manner of history, therefore, are alike matters of

dispute. As history is thus at a singular disadvantage with certain other departments of human knowledge, we can scarcely be surprised that there should exist some difference of opinion with regard to its comparative educational value. A few remarks on the different conceptions of history that have prevailed even during the last two centuries will suffice to show that this is a subject on which unanimity need never be looked for.

Dryden was the contemporary of Locke; and as he was the greatest man of letters of his day, his views of history may be regarded as the most enlightened then possible. In an interesting fragment accompanying a life of Plutarch he has spoken at length of what he considers to be the proper domain and function of the historian. He distinguishes three departments of history—biography, annals, and history proper. The subject-matter of annals and history proper is identical: they differ only in their mode of presenting it. The historian proper must aim at a certain 'dignity and gravity of style,' and he is at liberty to indulge in legitimate guesses at the probable causes of events—always, however, on the condition that he sees to it that he is free from all prejudice and superstition. He must also be careful to pass by all 'matters of trivial moment as debasing the majesty of his work.' Here we have Dryden's conception of what is the true domain of history. Nothing must come within its province that involves a break in the majestic march of the historian's style. In other words, the form of the history is of graver importance than the matter. It gives us also a curious idea of the uncritical way of thinking about history in Dryden's day, when he tells us that the one British historian of the first rank is the Scotsman, George Buchanan. On the real value of Buchanan's History of Scotland it is sufficient to quote the late Mr Hill Burton, who was disposed to speak well of his celebrated countryman. 'Buchanan's History,' he says, 'is of no more use and value than as a bulky exercise in the composition of classical Latin.' As at least the first half of Buchanan's History is pure fable, this

judgment can scarcely be considered too severe. When we have a man like Dryden, therefore, with such ideas about history, we need hardly wonder that his contemporary Locke should think lightly of its educational value.

Voltaire was among the first to introduce a more rational conception of the true nature of history. He treats with contempt the two types of the historian of his own day—those who thought they did the world a service in publishing the petty gossip of courts; and those, equally foolish, who thought that history is but the detail of treaties and battles. In a few pregnant sentences in a passage published in 1744, he sketches what he thinks is the true field of history. To be instructive, he says, history should account to us for the growth or decrease of population in different countries; it should explain why one nation comes to be strong on land, and another on the sea; it should relate the introduction of the arts, commerce, and manufactures among different peoples; it should point out the radical vice and the dominant virtue of each nationality; and above all it should have for its grand subject the changes in the laws, customs, and character of man. The great histories of Hume, Robertson, and Gibbon in large degree realised Voltaire's ideal, and it may be admitted that in many respects they are to this day unsurpassed. Yet even they are by no means free from the conventional notion of the so-called 'dignity of history.' Dazzling panoramic effect is their predominating aim, and not the single-minded desire to see and to expound the drift and scope of the great societies of men.

It is only in our own age that Voltaire's conceptions have been worked out with fidelity and adequate intelligence. Yet at no previous time have so many conflicting notions prevailed regarding the true scope and aim of history. Our historians cannot even agree as to what history proper really is. One eminent historian tells us that history properly understood is essentially the history of the state. We may have histories of art, of science, of literature, of manufactures; but the historian proper has no concern with these things. In treating of these he is poaching on another's manor, dissipating his own energies, weakening his own work. Each of these subjects should have its own special historian, who is yet no historian in the true sense of the word. On the other hand, we have another school who hold that the domain of the historian is co-extensive with the life of a people, that it has for its legitimate theme not only the work of statesmen, but of authors, of artists, of traders, and of handicraftsmen. For those who read and do not write history the dispute does not seem one of grave importance.

But this dispute is only one of many. Is it the primary aim of the historian to interest or to instruct? The difference of opinion here has arisen mainly in connection with Macaulay's

famous History. On the one hand it is maintained that the type of mind required to produce a work like that of Macaulay is essentially unhistorical. Its tendency is to search only for facts that will tell, and to relate them in a manner that indisposes the mind of the readers to receive the true lessons of history. Such a mind as Macaulay's, it is said, finds its true sphere not in history but in historical romance. With the best intentions in the world, a Macaulay unconsciously warps facts, and groups them in a manner that the scientific historian has but the invidious task of undoing. If it be said that Macaulay at least ensures readers, it is replied that this but makes matters worse. These readers have only had bad mental habits aggravated, and have but learned lessons which they will have daily to unlearn. Writers who reason thus maintain that the paramount duty of the historian is to eschew this desire to interest his readers. The author of a scientific treatise thinks only of how he may most simply and accurately state his facts and prove his conclusions; and in no respect is the aim of the true historian different from this.

It is evident that the question here in dispute is one that cannot be summarily settled. The writers of both schools agree in saying that truth is to be set before every other consideration; and they each maintain that their own method is that best fitted to elicit and to present it. When the question is closely considered, it seems to resolve itself into this—Is emotion or the absence of it more likely to mislead a writer? It is clear that no categorical answer to this question is possible. If emotion tends to obscure perception, the want of emotion is as likely to blunt it. Every event and every person connected with the French Revolution may be analysed with perfect precision and dispassionateness, but should we then be in a position to realise that demoniac burst of human passion? If we are to have the whole truth, imaginative presentment must have its place as well as scientific analysis, and Carlyle must at least supplement Mignet.

Another point keenly discussed at present by writers of history, and one of far greater importance than any of those already touched on, is the function of great men in the development of society. Carlyle's extreme views on this subject never perhaps found many supporters. That the bulk of mankind are but so many ciphers, and great men the figures that give them significance, is a conception pardonable only as a distortion of a great truth. Before Carlyle's day there was indeed no tendency to minimise the importance of great men. Hume, Robertson, and even Gibbon put their best work into their accounts of the great characters that came in their way. It would seem, however, that Carlyle's extreme views have brought about something like a reaction. The tendency at present is to dwarf the figures which have long seemed to tower above their contemporaries. In the latest History of the reign of Charles I. we have a signal example of this tendency. One of the great

traditional figures of English history is John Hampden, whose personality Macaulay has made familiar to every English reader. In the History of which we speak, Hampden is a dim figure in the background, who plays the pettiest part in the great struggle of his time. If common-sense revolt somewhat at Carlyle's conception, no more is it reconciled with this later view. Every age has its own great men, and we see for ourselves how in our own day one or two great men seem to absorb into themselves the life of a people. And if this is so in our own day, we may conceive that in greater or less degree it has ever been the same.

There is finally the great question whether a 'philosophy of history' is possible. As from a given arc we can determine the complete circle, may we from the facts of the past foreshadow what must be the course of the future? The question will probably occupy men's minds to the end of time; but meanwhile, according as he answers it must the historian be unconsciously biased in his treatment of the past. If he believe that a philosophy of history is possible, he will inevitably manipulate his facts to suit his theory.

From all these conflicting views, we gather that history can never present us with a definite and perfectly coherent body of knowledge such as we have in the sciences. Yet it must surely be a wise instinct that has led every people to make the deeds of their fathers the first and chief study of youth. A fact of science and a fact of history differ fundamentally in this—that the former permits of only one construction, the latter of a thousand. It is by reason of this very peculiarity that the facts of history have a supreme value of their own in developing men's character and intelligence.

JOHN VALE'S GUARDIAN.

CHAPTER XI.

In the early morning, Madame Vigne crept quietly into the room where the two wanderers lay, and looked at them with an air which was motherly and almost proprietorial. They were both sound asleep, and they certainly looked innocent enough to awaken all the good creature's womanly sympathies. John, with his fair hair tumbled about his forehead and his cheeks a little flushed with sleep, lay with outcast arms and upturned face, breathing softly and regularly. His skin was of exquisite fairness, and he pleased Madame's eye more than the swarthy and bulldog William, who even in his sleep wore a look of resolution, and lay curled up doggedly with his face half-buried in the pillow, as if he slept with a purpose, and were determined to have full value for his time.

Madame Vigne herself was of a swart complexion. Madame Vigne was of Marseilles, and came of swart people, and had lived most of her life amidst a swart population. So John's delightful English fairness made him charming to her; and when she had stood looking at him for a time, she went round to this side of the bed, and sitting down there, caressed his hair with her dark plump hand, and smoothed it with great gentleness so as not to awake him.

'You will take care of yourself wherever you go,' she said to herself, nodding her curly head at Will, and silently apostrophising him. 'But this poor innocent!'

The little Hector of whom she had spoken last night had had raven hair and lustrous black eyes and cheeks like a berry; but she found a likeness to him in John, somehow, as women will, and took a tender fancy to the boy, which was all the more pronounced because of her memory of his helpless looks of the night before.

When she had looked her fill, Madame stole softly from the room and, closing the door behind her with great caution, went silently down-stairs. There, aided by a rosy-cheeked damsel of thirteen or so, who answered to the name of Sar'anne—a Frenchified mutilation of Sarah Anne—she busied herself in household preparations until a moon-faced kitchen clock which struck the quarters announced half-past seven. At that she slid up-stairs again and knocked softly at three separate doors. M. Vigne answered grumpily from behind the first; the little foreigner responded chirpily from behind the second; and from behind the third, which was situated in the garret, no answer came at all. Madame opened the door and whispered: 'Mr Orme! Mr Orme!'

A voice which sounded as if it were obscured by bedclothes, answered 'Hillo!' and a snore followed so close upon the exclamation that it was evident that the speaker had gone to sleep again at once.

'Mr Orme!' repeated Madame in a sibilant whisper, 'if you do not answer at once, I vow there will be no breakfast for you.'

'What's the matter?' asked the inmate of the chamber in a voice at once unctuous and husky.

'It is time to get up,' responded Madame. 'Dress very silently; there are two children asleep below you, and I do not wish them to be awakened.'

Mr Orme, with a yawn which sounded midway between a moan of anguish and a groan of indignation, stirred in bed, and leaning over, artfully padded with his hand upon the floor to impress his landlady with the belief that he had arisen.

'I know better than that,' said Madame, holding the door slightly ajar. 'Come and tap; I shall not believe you until you do.'

The invisible Mr Orme yawned again, and this time the note was all submissive. A moment later, a shuffling footstep crossed the room, and a set of tremulous knuckles rapped at the inside of the door.

'Be very careful,' Madame whispered, 'and make no noise.'

A yawn like the growl of a caged bear, with the words 'All right' somehow muffled in it, responded to this injunction; and Madame, stealing down-stairs again, peeped in passing into the room in which the young wanderers lay, and finding them both still sound asleep, continued her downward course. A quarter of an hour later, M. Vigne, the little foreigner, and Madame were seated at breakfast; and when they were half-way through the meal, Mr Orme appeared. Mr Orme had so balloon-like a figure, and his arms and legs were so stiffly attached to it, that he had an air of being inflated, and could hardly have surprised anybody much if at any given moment, he had floated upward and bobbed his bald head

against the ceiling. There was a contradictory sloth and weight in all his movements, and his face expressed a contradiction equally pronounced. Whether he were originally made to express the bitterest discontent with things in general, and had been persuaded after trial to accept his troubles comically; or whether he had been intended for a spirit of mirth, who had found his humour crushed by adverse circumstances, his face bore such a blending of humorous opposites that it would have been impossible to say. At one time the corners of his mouth would take an almost fearful downward curve, whilst his moist eye trembled, and his eyebrows twitched with what looked like hidden laughter; and at another the moist eye would express the profoundest melancholy, whilst the other features of his too rubicund visage seemed to be struggling with a hidden smile. His nose seemed to be on fire and to lend an actual radiance to the chamber; but the rest of his face was wofully pale in comparison; and these signs, coupled with the tremulous motion of his hands, seemed to indicate a fairly confirmed habit of intemperance.

'One can see where you're going, Mr Orme,' said the lady of the house severely. 'It is no fault of mine if your coffee is cold; and I suppose it is useless to offer you anything to eat.'

Mr Orme's pale baldness was sparsely interrupted by tufts of disreputable gray hair of that peculiar tone which seems never to belong to respectable or successful people. He put up his shaky hands and clutched a few of the tufts on being thus addressed, and groaned softly to himself.

'You will get no pity,' said Madame. 'Take your coffee and go to your work.'

He helped himself to milk and sugar with an air at once surreptitious and apologetic and drank in silence.

'The children, my dear Mathilde?' said M. Vigne, speaking in his native language. 'Have you thought of anything? Have you decided upon anything?'

'You know, Jean,' Madame Vigne responded, 'that I shall not dream of deciding upon anything until I have consulted you.'—M. Vigne nodded solemnly in assent to this statement.—'I ask myself first,' pursued Madame, 'what is my Christian duty. Perhaps they are young marauders.' She looked hard at her husband; and M. Vigne looked searchingly at her. When he had decided that he was expected to shake his head at this, he shook it vehemently. 'I knew,' she said triumphantly, 'that you would not think so. Perhaps they have been driven from a harsh home by abominable cruelty.'

'It is very probable,' said M. Vigne.

'I think so too,' Madame responded; 'but I will question them this morning and find out what I can about them.'

'That,' returned Monsieur, 'is what I should have desired.'

'Evidently,' said Madame, 'or I should have asked you first.'

Mr Orme, during this brief colloquy, except that he had groaned softly to himself at measured intervals, like a human timepiece constructed to compute the moments in that dismal fashion, had kept silence, turning his moist eye upon Madame

when she spoke, and upon her husband when he answered.

'Who are the children, Madame?' he asked in English. 'This is the second time I've heard of 'em.'

'I do not know who they are,' Madame answered. 'They were brought here last night by M. Jousseran, who met them in the street. They have come on foot from somewhere'—waving her fat hands hither and thither, as if to indicate complete incertitude as to the direction from which the wayfarers had arrived. 'They are respectable; they are dressed like little gentlemen. One of them is marked from head to foot—do you hear me?' (with a tragic wrath before which Mr Orme shrank and cowered)—'is marked from head to foot with cruel blows.'

'I daresay,' said Mr Orme, 'that somebody has beaten him.'

Madame hailed his inspiration with a glance of so much scorn that Mr Orme withdrew into himself and avoided her eye whilst he sipped the remnant of his coffee.

'It is time we went,' said M. Vigne, rising and addressing his compatriot.

'Do you hear that?' said Madame, turning upon her English lodger. 'You understand French fast enough when it is not your business. You are an omnibus to go to work, and an express to leave it.'

Mr Orme gathered himself shakily together and arose. 'I was only waiting, ma'am,' he said, standing before her, with his elbows glued to his sides, and his hands waving feebly like the flippers of a seal.—'I was only waiting, ma'am, to indicate that in case either of the young gentlemen should be in want of employment, and should be qualified to undertake the very simple functions'—

'You will be late,' said Madame, cutting him short. 'In point of fact you are late already.'

Mr Orme said no more, but after one or two false starts, pattered aimlessly to the door, sighted a dingy silk hat upon a hook in the hall, pattered towards that, and after an interval for reflection, took it from the hook and put it on. Then he pattered towards the door with a curious air of going there by accident, and slipped furtively into the street.

Madame paid two or three visits to her protégés before they awoke, but at length found them half dressed. She kissed them both in a business-like way, and stood by to superintend their toilet, as she had done on the previous evening, retiring for a moment to bring up their shoes, which had been cleaned and polished with great fineness by the hands of Sarah Anne. When they were fully dressed, she ushered them down-stairs, and the little domestic appeared with a second edition of breakfast: a pot of coffee, by no means too strong, for Madame Vigne's purse was narrower than her instincts of hospitality, a great bowl of milk, a big loaf, and a small pat of butter. Both the boys had healthy appetites, and in spite of their hearty meal of the night before, they attacked these simple provisions with a gusto at which Madame looked on well pleased.

'And now,' said Madame, when Sarah Anne had cleared away, 'I must have a talk with you little men. What do you little men mean to do?'

'We mean to go to London, ma'am,' said Will.

'And what do you mean to do when you have got to London?'

'I shall find something to do there, if you please, ma'am.'

'Perhaps you may, perhaps you may not.' Madame responded. 'London is a big place, my child, and all big places are cruel.—Do you know anybody in London?'

'No, ma'am,' said Will. The question cast him down more than a little, and his face showed it. 'We don't know anybody in London.'

'Well now, tell me,' said Madame, drawing her seat nearer, and laying a kindly hand upon John's light head while she questioned his companion, 'why did you run away from home?'

There was something so very motherly in Madame's kindly face, something in the gesture with which she caressed John's curls, something even in the cushioning proportions of her overgrown figure, which invited confidence. Will began to explain, and she to question, and in a little while the whole story became tolerably clear. Madame looked more and more troubled, though none the less affectionate and kindly, as the tale went on.

'I do not know what I am to do,' she said perplexedly. 'It is not possible to find it in the heart to send you back again, and it is not possible to find it in the heart to let two babes wander all over the world alone. You must stay here until dinner-time, and then my husband shall decide about you.'

The boys were none too eager for a renewal of their march, for the first day's walk had left them sore-footed and stiff limbed. Even Will was contented with an hour or two's respite from the road, and by-and-by John was perfectly happy and absorbed.

'Stay here,' said Madame; 'I will find you something to do.'

She bustled away, and in a little while returned with two frames, in either of which a clean unmarked sheet of drawing-paper was tightly strained over a sheet of glass. These frames being set in the window, a design in outline strained at the back of the glass came clearly into view. Madame produced two needles set in cork, and instructed the boys to prick upon the clean paper over the outlines indicated below.

'Now,' said Madame, 'anybody who chooses to be careful can do this work very nicely; and anybody who chooses to be careless can spoil the paper by pricking in the wrong places. That I am sure you are too kind to do, for the paper is cartridge paper, and every sheet costs threepence.—Look! Let me show you to begin with.' And Madame, taking one of the cork-set needles, pricked over the edge of a leaf in the left-hand top corner of one of the frames. John watched with great interest, and when she turned smilingly towards him, asking if he thought he could do that, he reached out his hand eagerly for the home-made stylus and set to work at once with great care and diligence. When he had pricked out the stalk on which the leaf depended, he turned round to Madame for approval.

'That will do excellently,' she said, clapping her fat hands together in applause.—'And now let me see what you can do.'

Will also received his lesson, and set to work; and Madame having watched for a minute or two went away to her household concerns. She sailed in at intervals to see how the work progressed, and was lavish in enthusiastic compliment, so that both the boys were contented with their labour and felt in a very little time quite accustomed to it. It was a simple and easy task, and to John's blunt mind it seemed even delightful. There was a bird upon the bough he had been set to trace, hovering with outspread wings above a nest from which were thrust half-a-dozen callow heads and open bills. This enticed him so strongly that he must needs desert the other parts of the design for it, and he worked away with bright eyes and eager face and parted lips until he had followed every line of it actually. Then he let off an exultant crow, and turned so vivid a look upon his companion that Will was quite amazed at him.

'Why, Jack,' he said, 'you're like what you used to be.'

'Am I?' said Jack, without paying much heed to the exclamation.—'Look at it! Ain't it jolly? Wouldn't you think she was just flying? I say, how the chaps that do this must watch the birds. It isn't like drawing from a copy, because they won't keep still a second. She wouldn't be like that longer than it would take to clap your hands together.'

'Yes,' said Will, 'it's jolly pretty.' Then, after a lengthy pause: 'Do you think this is work, Jack?'

'I don't know,' Jack answered. 'It's jolly easy, if it is, and jolly nice as well.'

There was no trace upon him of the settled dullness into which he had fallen for months past, and he went back to his labour with the warmth and light of this new enthusiasm still upon him. But in a little while he tired among the intricacies of branch and leaf, and leaning his head on Will's shoulder, fell to watching him dreamily whilst he pricked away with a dogged and careful persistence thoroughly characteristic of him. With occasional renewals of enthusiasm on John's part, and slow, conscientious persistence on Will's side, the work lasted the morning through; and Madame professed herself delighted by their skill and industry when she came in to lay the cloth for dinner. There was such a community established between John and Madame in this brief space of time that he took her by the hand, and dragged her to the window to exult in his work with as little shyness as if he had known her for a year. Whilst she bent with clasped hands before it with ejaculations of simulated delight, John put his arm round her fat waist, and rubbed his head against her shoulder; and at these signs of confidence and affection she fled precipitately to the kitchen, where she threw her apron over her face and rocked herself to and fro for a minute, surrendering herself to memories of the little Hector. From these tender reminiscences she emerged instantly into a condition of beaming good-fellowship, and went to and fro in her preparations with such a swirl of petticoats that the house seemed full of her. Mr Orme looked like a balloon and travelled like a sloth. Madame in repose looked immovably weighty, and waited hither and thither when she gave her mind to

motion as if she were built in sylph-like lines and texture.

A few minutes after the hour of one, Vigne and Jousserau came in together, and shortly afterwards, Mr Orme presented himself. He brought with him a faint odour of rum, and was less depressed than he had been earlier in the day. Madame with much vivacity displayed the work of the morning and called upon everybody to praise it. It seemed that the whole household took its cue from her in most things, and a little more enthusiasm and admiration were expressed than perhaps the boys' labours actually called for. When due tribute had been paid, she whisked away, and returned with a tureen in which steamed the contents of a capacious *pot-au-feu*. The liquid, which was rich in floating shreds of vegetables and in pepper, was served first; and the solids of the dish, which were not quite so plentiful, came afterwards. Eked out by the great lumps of bread which Madame carved, there was enough for all; and when the meal was over, the four elders sipped a rather feeble black coffee, whilst the two Frenchmen smoked cigarettes, and Mr Orme puffed solemnly at a short well-blackened clay pipe.

'I was about to observe this morning, Madame,' said Mr Orme, gently caressing that incandescent nose of his, as if he warmed his fingers at it—'I was about to observe this morning, ma'am, when you reminded me that it was time to go, that there is an opening at the office for a youth. I do not know what your views in respect to these young gentlemen may be, but for an industrious and respectable youth there is an opening—an opening, Madame.' He described the opening with his trembling hands, as if it were something circular.

'I do not know,' said Madame, frowning thoughtfully, 'what M. Vigne will decide upon.'

M. Vigne had only spent twenty years of his life in England, and since he had resolved from the first that it was the business of people who desired to converse with a Frenchman to be acquainted with the only language worth speaking in the world, he had very easily contrived to remain in complete ignorance of the insular tongue.

'Jean,' said his wife, addressing him, 'it is very hard to know what to do. I know the whole story of these poor little beings now, and it would be shameful and impossible to send them back again.'—M. Vigne nodded in his stately and assenting way.—'M. Orme tells me there is a place vacant at the printing-office. They want a boy there. Do you think the dark one could go, and the light one stay here, and make patterns? They would earn their bread. We may know better what to do with them in a little while, and the fair boy is so good, so gentle, so docile. He reminds me of our—' There Madame choked a little, and the too ready tears of sympathy made her black southern eyes twinkle with sudden moisture.

'My dear,' replied M. Vigne, 'you have your health only to consider. It will put extra work upon you, and I sometimes think that you have too much already.'

Madame set her thumb nail behind her glistening white teeth and snapped it triumphantly.

'That for my health!' she said. 'I thought that you would agree with me.'

'My dear,' said M. Vigne, with stately gravity, 'you are invariably right.'

THE 'LADY BRASSEY' MUSEUM.

ALL admirers of the late Lady Brassey's books and marvellous collection of natural-history objects will be interested to hear of the Museum, which has just been arranged as a lasting tribute to her memory by her husband at his residence in Park Lane. The collection is one of varied scope and attraction, and is enhanced by the delightful manner in which it has been arranged. The entrance to the Museum is from the Durbar Room, which visitors will recollect having seen at the Indian and Colonial Exhibition; the room is much the same as we then saw it, with the exception of the windows, which are new and specially designed, and the door from Seherampore. Ascending the staircase, we come upon curiosities from all parts of the world, some of intrinsic value; whilst others are of interest for the associations and histories attached to them. Many of them have been gathered from countries seldom visited; and others—for instance, the beautiful sponges and corals—need depend upon nothing but their intrinsic beauty to make them specially attractive. Among the sponges are many species of such marvellous and diverse shapes as may well cause astonishment to those who are only acquainted with the common domestic variety. The corals, true products of Nature, bring vividly to the mind the incomprehensible greatness of mother Nature; lovely as they are when dead, it is only, as Lady Brassey points out in her book *Tahiti*, when they are full of life, and the myriads of polyp stars are in united action, exhibiting a perfect blaze of colour, red, purple, and emerald green, in their varied tints, that their splendour can be appreciated. The group of beautiful delicate lace-like sponge corals popularly known as 'Venus' Flower Basket,' is one of the finest specimens ever exhibited. The Museum is ingeniously lit by electric light, the light being placed behind different coloured shells, and this in the sponge and coral cases has a charming effect.

Next in point of interest to the sponges and corals comes the collection of antiquities from the island of Cyprus, the result of some excavations made specially for Lady Brassey in 1884. The objects collected include some three hundred and twenty pieces of pottery, comprising vases of various kinds, lamps, and figures or fragments of figures. The excavations were for the most part from one tumulus or collection of tombs in the neighbourhood of Kurnin; and the objects range in antiquity from the Archaic, Phœnician, and Greek periods down to the occupation by the Romans, and possibly even past the commencement of the Christian era. Besides the specimens of pottery and glass, there are earrings, pendants, fragments of funeral wreaths, and small objects in gold. Here we see, too, a thin gold leaf which appears to have covered the face of the dead like a veil. There are one or two fine examples of Phœnician glass, made probably at Tyre by Phœnician workmen. In these the prevailing colour is deep blue with wavy lines of colours; this is

best seen in a small amphora-shaped vessel, the body of which is so decomposed into granular particles that it can scarcely be handled without detaching portions. The elegant handles have been less affected, and appear to be of a dark orange colour. The greater portion of these pieces of ancient glass are remarkable for the iridescence they display, produced by the lapse of time; even a vase of pottery has become iridescent from having lain so long under ground. There is a wonderful play of colour on the glass viewed in different lights. In connection with these antiquities there are some from Central America displayed, comprising some ninety examples of gold ornaments and implements from the tombs of the ancient Indian inhabitants of the provinces of Antioquia, Cauca, Boyacá, and the republic of the United States of Colombia. This collection of itself is worth two thousand pounds.

The wonderful assortment of curios in the Borneo case forms a regular armoury with its display of *sunjutans*, gleaming creases, and other death-dealing weapons. A *sunjutun* is a weapon used by the head-hunter, being in the nature of a blowpipe, carrying within it a poisoned arrow, the arrow being made of the sago-palm. The creases vary. The ordinary *parang-latok*, which is carried by every man and nearly every woman, is a blade of steel nearly half an inch thick, of considerable sharpness, the sides being sometimes carved with engraved patterns, and adorned with trophies of human hair. In addition to these murderous relics, there are bracelets, anklets, tobacco boxes and pipes, betel-chewing instruments, raw gutta-percha, alligators' eggs, edible birds' nests, from India, Ceylon, Burma, Borneo, Japan, and the Straits Settlement. These treasures were brought home from the last voyage of the *Sunbeam*. Other curiosities are seen in the sun-baked pottery of the Orkney Islands, the quiver stone from the East Indies, flexible as india-rubber; the honeycombed ore showing chlorites from Australia, black granite from the hillside between Wairoa and the end of Lake Tarawera, which is now all changed since the volcanic eruption; a 'Zizyphus' or *Spina Christi* (crown of thorns) from the plains of Jericho; souvenirs of the Commune from Père-la-Chaise; fragments of the painted glass windows of the House of Commons damaged by the dynamite explosion in 1885; model of a sandstone ship from Burma, which floats, &c. The wonderful feather-cloak of scarlet and yellow oo and *mamo* feathers from the Sandwich Islands is exhibited. The cloak is made of one thousand feathers, taken singly and fastened into a sort of network of string. The yellow feathers are found only on these islands, and are always difficult to procure, because the use of them is a prerogative of royalty and nobility. There are only a few of these specimens of cloaks known of, one being in the British Museum, brought over by Captain Cook. From the Aleutian Isles comes a curious dress made of sea-birds' skins, beaten together. Some of the draperies on the wall are worthy of mention, noticeably those of Tappa from the various islands in the South Pacific. Tappa is the bark or pith of the paper mulberry. Its use is, or was, universal in the South Sea islands for mats and clothing, and it is made of many qualities. In

manufacturing it, the narrow strips of pith are laid lengthways and crossways alternately, so as to interlace each other, on a long narrow table, wetted profusely with water, and then hammered together with mallets.

There are ornaments and implements from nearly every uncivilised race in the world, besides choice specimens of European jewelry from Turkey, Bulgaria, and Albania. The Museum includes the original drawings by Mr Pritchett for the illustration of *In the Tropics, Trades, and Roaring Forties*; and a collection of photographs contained in about eighty folio volumes, besides Lady Brassey's original manuscripts. Lord Brassey is anxious the working-classes should reap the benefit of his varied treasures, and for this purpose the Museum will be thrown open for them to visit. There will be lectures explanatory of the curiosities, which will naturally add to the interest of those viewing them. Some idea of the graceful tribute to Lady Brassey's memory may be gathered from the foregoing description of this rare and instructive collection of natural and ethnological objects. These are a delight to both the naturalist and the artist; while even to the uninitiated the contemplation of such beautiful objects cannot fail to elevate the thoughts, stimulate the intellect, and raise the mind to a sense of the many glorious objects in the lower forms of life, such as are exhibited to the wondering gaze of those anxious to obtain a glimpse of the marvels of the deep, as well as of the curiosities of all times and climes.

ASTBURY'S BARGAIN.

A STORY IN SIX CHAPTERS.

CHAPTER II.—DAISY.

THE latest editions of the evening papers contained a brief paragraph under big headlines: 'GREAT FRAUDS IN THE CITY!'—'FLIGHT OF THE SUSPECTED CRIMINALS!'—and so forth. The information given under these startling lines was somewhat meagre. Messrs Ellicott & Co., the well-known ship-owners and ship-brokers of Fenchurch Street, had recently discovered that a series of ingenious forgeries had been perpetrated by some one in their employment. The sums obtained by these forgeries, so far as could be at present estimated, amounted to the enormous total of ninety thousand pounds. A rigid investigation into the affair was in progress, and in the meanwhile it was discovered that the confidential clerk of the firm, named Gilbert Astbury, had absconded. He had been aware for several days that he was under suspicion, and his sudden flight seemed to justify it. The police were on his track, and no doubt of his speedy arrest was entertained.

The news of Gilbert's disappearance was the cause of much excitement to the inmates of Cedar Cottage; but the views taken of it by each of the three women differed. Hetty regarded it as an unquestionable proof of the innocence of Henry Dacon; and whilst she lamented the position of his and her former friend, she was glad that her lover was thus exonerated from all possibility of

doubt as to his complicity in the fraud. Mrs Silvertown was painfully conscious of the injury which her acknowledged relationship with the criminal—she had at once accepted the theory that he was guilty, since he had fled from the investigation—would entail upon her and hers. To Daisy the views taken by her aunt and cousin were incomprehensible. She could partly understand Hetty; but she could not understand her aunt.

'If it is true that Gilbert has gone away,' she said with quiet confidence, 'it is not to save himself, but to shield some one else.'

'What nonsense you talk, child!' exclaimed Mrs Silvertown, putting on her gold-mounted pince-nez to examine the girl attentively, as if to discover whether or not the defence was made seriously. 'Gilbert is not a fool, and must have been perfectly aware of what his disappearance at this moment must mean to him. An innocent man never runs away when such a dreadful charge as this is hanging over him. Poor fellow—it is terrible and most incomprehensible. He had such a chance in life as few young men without fortune ever obtain.'

'That is just it, aunt,' persisted Daisy in her low voice, but without lifting her eyes to meet the glittering glasses which were fixed upon her. 'He had the chance, and he was worthy of it. Therefore his conduct is, as you say, incomprehensible, and that is why I think he is innocent.'

'Daisy!—My dear, I said that an innocent man does not run away.' There was a degree of amazement in the tone of the exclamation, and a degree of reproach in the mild reminder of Mrs Silvertown's infallibility, which indicated that she was a lady quite unaccustomed to contradiction anywhere, and certainly not in her own immediate family circle.

Daisy was silenced. As a rule, she submitted without a sign of rebellion to her aunt's verdict; but this time there was a slight flush on the pale cheeks and a compression of the lips suggestive of irritation at the widow's self-sufficiency. Hetty was too well pleased to find that every possible suspicion was cleared away from Henry to pay much heed to the trifling passage between her mother and cousin.

Mrs Silvertown was more astounded by the audacity of her niece than by the assumed guilt of the fugitive, although that was most offensive and, as she fancied, derogatory to her; for she had been his friend and sponsor. She had—when he seemed to be prospering—even admitted that there was a distant family relationship between them; and the remembrance of that admission rankled in her mind now. Instead of experiencing any sense of pity for Gilbert, she was angry with him, for his defalcation was a direct personal injury. She would have been relieved if there had been any way in which she could save her own reputation for perspicacity by hinting that she had always had a misgiving about the young man. But such consolation was denied her. His success had been so rapid; the favourable impression he made upon every one to whom he had been presented so marked, that she had not been able to resist the delight of playing the patron to the favourite of the hour. Thus she had committed herself too definitely as voucher

for his respectability to dare to shirk it now. She could only exclaim that she was horrified—that she had never been so deceived in all her life, and that it almost shattered her faith in the honesty of the whole human race. She had done so much for him—on account of his poor dear mother, who had been mercifully spared by Providence the spectacle of his disgrace—that she could never forgive him, or forget her own weakness in being led so far astray by misplaced confidence.

Her imagination so far exaggerated the benefits she had conferred on the ungrateful creature, that it misled her into the delusion that she had introduced him to Henry Dacon. The fact was that Gilbert had brought his friend to Cedar Cottage, thereby earning the special approbation of the widow, who saw in the nephew of John Ellicott of Overton Park a most desirable match for her dowerless daughter. She had thought of Gilbert as a possibly acceptable suitor; but she repudiated the bare idea of it as soon as Dacon frankly declared his intentions and was accepted by Hetty. She pretended to herself that she had never thought of such an alliance, and was angry with Gilbert for having been so ambitious as to fancy she would ever have sanctioned it.

Mrs Silvertown was a plump, fair, lively lady, still on the hither side of fifty. She had a great deal of vanity, but it was carefully held in hand by a large measure of common-sense. She was good-natured to this extent—she would help anybody, if the help required did not tax her pocket, whilst it redounded to her credit. She was blessed with unlimited faith in herself, in her own wisdom, foresight, charitableness, and all the other noblest qualities of humanity; and she had admirers enough of both sexes—sincere and sycophantic—to sustain her in the creed which makes life most agreeable.

It was only this faith which enabled her to bear with equanimity the open rebellion of Daisy in regard to Gilbert. As she had forgotten the circumstance that it was he who had brought her into contact with the desirable son-in-law, so she had been long oblivious to the quarterly payment regularly received from the late Mr Forester's executors which defrayed all Daisy's expenses, and was pleased to think of herself as the generous benefactor of the orphan niece. Moreover, but excusably, she ignored the item that the girl was quietly making a way for herself in authorship, which might have permitted her—even without the settled provision made for her—to adopt an independent position.

Such a thought, however, never crossed Daisy's mind. She had grown up under the influence of her aunt, who naturally held the position of a parent to her, and looked upon Cedar Cottage as her only home. She accepted so implicitly the theory that her aunt's protection was a necessity for which the submission of a daughter was due, that she had never dreamed of asserting independence.

The advent of Gilbert Astbury had altered her views of everything. At first, it had brought new light and joy into her life: new strength, new hope inspired her visions of the future. He was poor, she knew; he was clever, she was sure; he was ambitious, she could easily divine. Might not she, somehow, help him to win the goal of

his ambition? Then for the first time she had begun to consider her position. She found but ~~wine~~ means were at her disposal; and with the sanguine ideas which the first cheque from a publisher inspires in the budding author, she imagined that with hard work and an average continuance of the success her early efforts promised, she might be able to do wonderful things in helping forward the man she loved. The castles in the air thus built were very beautiful; and the dreams of bliss with which she filled them were very sweet. Then the castles and the dreams were all blown into thin air by one soft breath of the man for whose sake they had been all created.

Gilbert, attracted by her quiet, thoughtful, and gentle nature, had early accepted her as his friend, and he soon made her his confidant. When the rapid success he was making—and she was so proud of!—was confirmed by the statements of his friend Harry Dacon as well as by his own cheerful humour, Gilbert gave her the bit of confidence which for the time turned day into night. He loved Hetty. He worked and lived only for her.

Daisy was silent, stunned by the disastrous mistake she had made, and the utter darkness into which the sudden discovery thrust her. Yet she was not angry with the man who had blinded her. The golden fancies which had made the world so beautiful to her were all gone; and it was the more misery to her to know that he, too, must presently step into the same dark region, unpenetrated by any ray of hope to save him from despair. She shrank from telling him that she knew he must undergo the same pangs he had unconsciously and innocently inflicted upon her. She loved him so much that he was at once exonerated from all blame in her mind; and she felt pity for him as keen as for herself. Hetty had told her that she was engaged to Henry Dacon. Gilbert must find that out for himself. The bitter knowledge would come upon him soon enough, and, judging by her own sensations, he would be glad that she had left him a few days—or, it might be, even a few hours—to revel in the paradise of hope.

He did learn the truth soon; and then had followed much unhappiness for the two men and for Hetty, whilst Daisy looked on with her own sorrow hidden and unsuspected. She tried patiently and tenderly to help the others without one of them guessing that she herself stood in so much need of sympathy.

The discovery of the forgeries in which the names of the accepted and the rejected lover were involved had caused a diversion of the anxieties of the five people most interested in the result of the investigations which had been instituted. But Daisy had not the faintest doubt that whatever the upshot might be, Gilbert would come forth scathless. She had no thought that it would be so soon necessary for her to assert this faith against the commonplace inferences which directed her aunt's judgment of his conduct; and she was considerably surprised that Hetty did not attempt to speak one good word for him. She was satisfied, however, that this silence was not due to callousness, but to Hetty's anxiety for Dacon's appearance. She, too, began to wish for his arrival, so that some more light

might be thrown on the state of affairs. She had no doubt that he would come, from the way in which Hetty listened to the sound of passing wheels and her frequent visits to the window.

CHAPTER III.—FOR HER SAKE.

On leaving Cedar Cottage, Gilbert went straight as the pathways of the pleasant Dulwich meadows permitted to Champion Hill Station and took the first train to the City. A hansom conveyed him to the corner of Fenchurch Street, and he completed his journey on foot. His destination was one of those massive blocks of buildings containing the offices of some of the most extensive London firms. He ascended a broad stone staircase, and on the first floor the broad swinging doors of Elliott & Co.'s offices faced him. He did not enter by them, but passing down a corridor, halted at a small door on which the word 'Private' was printed in gold letters. A latchkey with which he was provided gained him immediate entrance to a small but high-ceilinged apartment. It was well lighted by a large window, having a double frame of glass to deaden the din of traffic in the street. A rich Turkey carpet and massive oak furniture proclaimed this to be the sanctum of a person of some importance.

At the writing-table was a gentleman of thirty-five or so, who started to his feet on the opening of the door. He was tall, handsome, with trim mutton-chop whiskers, chin and upper lip cleanly shaved, and his head covered with bushy black hair. He wore the orthodox black cloth frock coat, and in every respect had the appearance consonant with his surroundings—that of a man of position and authority in a great commercial house. But when he saw who his visitor was, agitation displaced his dignity.

'I thought it was Mr Elliott,' he said huskily. 'I am glad you have got back before him.—What is your answer? Have you seen her?' In his eagerness for the desired information, he paid no heed to the whiteness of Gilbert's face or his physical exhaustion, so plainly evinced by the manner in which he grasped the back of a chair for support the moment after putting down his bag and other things.

'Yes,' he answered faintly; 'I have seen her.'

'That was lucky. How did you manage it?—for she told me that nothing would induce her to speak to you again until—— But, good heavens, Astbury, you look as if you were going to faint. Sit down, man. Here is a glass of water.'

Gilbert took the water, but did not sit down. The draught seemed to revive him, for he spoke quietly and with more firmness than at first. 'I suppose the hurry and excitement have upset my nerves a bit. I shall be all right presently. As you say, it was lucky I saw her—lucky for you.'

'Then you have the answer I expected she would give?—What is your decision?' Henry Dacon's lips were parched as he put the question; his eyes seemed to start with terror as he waited for the response. Strongly built man as he was, his whole frame shook with the intensity of his brief suspense. In the momentary pause before Gilbert spoke there was concentrated an age of misery and fear.

'My decision is what I promised it should be if she satisfied me that her happiness absolutely depended on you.'

Dacon sprang forward and grasped Gilbert's hands, looking as if he could scarcely believe his ears. 'Do you really mean this, Astbury?' he queried, joy and doubt contending in his mind. 'Do you think you are strong enough to carry it out to the end?'

'I will try,' was the calm and resolute reply. 'The sacrifice is a terrible one—it seems too great for any man to make for another, however strong the bonds of friendship between them may be.'

'It is for her sake,' was the calm and solemn answer.

'True, true; it is for her sake. Heaven knows I accept it only because it is so. Had there been any other way to spare her—to make her happy, I would have done anything, rather than let you take this burden on your shoulders. There is no way out of it except this, and as you meant to go away at any rate if she told you that—that—' He became more and more confused, and his face so flushed that a fit of some-kind seemed imminent. He did not complete the sentence, but ran on in another groove. 'It is hard for you—cursed hard. Will you not repent when you find yourself an exile, and think of what you know will be said here about you? Will you not, by-and-by, begin to feel that the sacrifice is too great, and seek to undo everything?' He had spoken with nervous rapidity, as if striving to drown in words the promptings of his better nature. His impulse in the first gush of admiring gratitude had been to say: 'No, Astbury: I will not allow you to do this thing even for her sake. I will bear the burden of my own folly—sin—madness—call it crime at once. You, however, shall not suffer for me.' But the weakness which had betrayed him into his present position proved stronger than his nobler instincts. Good and bad were so equally poised in his character, that temptation of any kind always weighed the balance down on the wrong side, although he suffered the acutest pangs of remorse afterwards.

His superficial impulses were always of a generous nature. Warm-hearted and fond of approbation, he delighted in doing a good turn for any one. Thus, when Gilbert first arrived in London, he cheerfully recognised his former schoolmate, and did everything in his power to promote the youth's prospects. But when driven into a corner, Dacon so intensely dreaded being detected in a fault, that he could not help trying to escape from it no matter who might be the scape-goat. He was bitterly sensible of all that Gilbert Astbury must hazard and lose by the course determined upon. He devoutly wished there had been any other way out of the hole into which he had tumbled; but there was none save the one Gilbert offered him. He persuaded himself that if Hetty's future had been as inalienably linked with Astbury's as it was with his own, he, too, could and would have made the same sacrifice for love's sake.

He tried hard to salve his uneasy mind with that reflection and with the constant iteration of the argument: 'It is all for her sake. He wishes to make her happy. So do I. She has told him there is only one way of doing it, and he agrees. I, also, must agree.' All the same, he was at the

last moment miserably aware that he was doing a base thing, and was frightened by the idea that when Gilbert had got more time for reflection—more time to comprehend the degradation to which he subjected himself—he would recant and seek to restore his good name.

'I have given you my promise,' said Gilbert with an earnestness that reached the degree of solemnity. 'Keep your promise to me—make her life happy, and I shall not regret what I do this day.'

'If it is in the power of the man she loves to do it, I will,' was the fervent assurance given with full intention and determination to fulfil it.

'Then do not have any fear about me. But should you fail in your promise, I shall see what it may be in my power to do.—Have you written the paper I require?'

'It is here,' answered Dacon, drawing from his pocket a sealed envelope.

Gilbert opened it, and read the letter it contained. There was not the slightest change in his expression as he studied every word and weighed its purport, as if committing the whole to memory.

'Are you not satisfied?' asked Dacon nervously. 'Is it not plain enough?'

'Quite plain, and I am satisfied. This would be enough to convict any man, even if he attempted to deny his handwriting.—There; take it back with the other papers. I wish your mind to be free from any haunting dread of the power this thing would give me over you. I wish you to be free to devote your whole life to her.—Now, are you satisfied?'

Dacon grasped his hand again, and was for a moment unable to speak. 'If I fail to keep my pledge,' he said with bitter emphasis as soon as he had recovered control of his voice, 'I shall deserve the worst fate that can befall a man in this world and the next. I ask no mercy.'

'So be it,' was the comment; and then abruptly: 'Tell me what are the plans you said you would devise for my escape?'

'Everything is ready, and not a bit too soon.' Dacon spoke promptly, for he was glad of any change of theme. Besides, he was intensely relieved by the calmness with which Gilbert appeared to view the present position and the future.

'Has Mr Ellicott sent to Scotland Yard yet?' he queried as Dacon opened the door of a lavatory, on the walls of which hung several coats and hats.

'Not yet; but he has gone to see his lawyer, Ardwick, to tell him he may take action as soon as he thinks fit.'

'Then the police may be at work now?'

'Not before my uncle returns.—Here, put on this overcoat—it is big enough to cover you without taking off your own. In the pockets you will find everything you require in the way of money, and the necessary letters and papers to enable you to act as the owner of the steamer *Hercules*, bound from Bristol to Rio Janeiro with a general cargo. She lies under orders to be ready to get up steam as soon as the owner boards her. You are the owner, and your name is Edward Harrison. The money you have there and the goods on board the vessel will give you a fair start in Brazil; and of course you will

have whatever more you may require from me as soon as means of communication can be arranged.'

'Your plans of escape are marvellously complete.'

'They ought to be, for they were made for myself; and even at that moment of peril, Dacon could not conceal a gleam of pitiful pride at this acknowledgment of his ingenuity; so you can depend upon it they have been made as thoroughly safe as could be. The coat will do—wide enough and long enough to change your whole appearance.'

'We will put it to the test,' said Gilbert quietly. 'But before we part, let this affair be thoroughly understood between us. Accident placed in my hands the proofs that you had involved yourself in extensive speculations; and that to cover your losses you had, without authority, endorsed bills in the name of the firm to the extent of about eighty-four thousand pounds. On making that discovery, my duty was to inform Mr Ellicott. I have not done so, and therefore have made myself in some measure a partner in the—transaction we will call it. You know I am not a partner in it, and had no suspicion of it until a few weeks ago. I told you, and you confessed, because you could not help yourself. I owe you something for your friendly help when I needed help so much. You reminded me of my debt, and told me that your exposure would blight Henrietta Silvertown's life, and I now believe it would. Then to save her, so long as you are true to her I shall be as one dead. All this is clear between us two; and now we have only to arrange how I am to get on board the *Hercules*. There is no one,' he added with bitterness, 'I have to regret my death, for death it is. You have many who care for you; and so it is better that I should go than you.'

'Don't speak that way, Astbury, or I shall cave in,' said Dacon, trembling, lest already Gilbert was repenting that he had undertaken the task of shielding him. 'I at any rate will miss you.—Come, shake hands, old fellow. I shall not forget my promise even for a moment.'

'I hope so, for your sake and for hers.—What about the trains?' The question was asked with an abrupt assumption of devil-may-care to hide the emotion his trembling lips betrayed.

Dacon looked at his watch, and then, to make quite sure of the time, stepped to the window to examine the dial of the church clock opposite. 'By taking a hansom,' he answered, 'you will catch the afternoon train easily. Get on board at once, sail at once, and then'—

He stopped, and there was such a look on his face that Gilbert was roused from the apathy which had taken possession of him.

'What is the matter?'

'My uncle is getting out of a four-wheeler below. Ardwick is following him, and next there is a stranger.—I believe he is a detective. Ardwick has decided that no more time is to be lost.'

'Then your plans are likely to fail at the first step.'

'Not unless you want them to fail,' rejoined Dacon, in hurried and excited accents. 'They will go into my uncle's room first, and then send

for me. Here; go into the lavatory. After the clerk has come for me, we will know that the coast is clear, and you can get away by the private door.'

Gilbert submitted to be hustled into the place of concealment. Dacon, with heart palpitating painfully, seated himself. His hands trembled so that he was compelled to press them down firmly on the desk before him in order to keep them steady. He did not attempt to take up a paper, but pretended to be occupied in studying a foolscap sheet on which there was much writing, followed by many figures and red lines suggestive of an exercise in Euclid.

There was a tap at the door communicating with the general office, and, as he had anticipated, a clerk appeared in response to his ready 'Come in.'

'Mr Ellicott desires to see you immediately, sir.'

'I shall be with him in a moment,' answered Dacon, not looking up.—'Has he brought Mr Ardwick and the other gentleman?'

'Yes, sir.'

'Thank you.'

As soon as the door closed, Dacon sprang to the hiding-place of Gilbert and released him. 'Good-bye, Astbury. I am your debtor for life. If you should fail in your escape, trust to me. Good-bye again.'

They clasped hands, and debtor and creditor parted—the one standing trembling on the threshold of discovery, the other passing calmly under the cloud of disgrace.

Gilbert walked quietly and unobserved down the broad staircase, out into the street. He hailed a passing hansom, and was driven to the railway station, where he was to enter the train which would be his funeral car; for he was leaving behind all that a man values in this world—the woman he loved and the certainty of an honourable career. What did it matter how things might turn out for him now? His only prospect of joy was that of learning that Dacon proved true and made a good and faithful husband to Hetty. He carried with him to his exile the consciousness of innocence and the tender satisfaction of knowing he had done all it was in human nature to do to prove how much he loved. By-and-by, perhaps the memory of this would brighten his way.

As for Dacon, he stood for a few moments dazed, like one who has just heard the sentence of death pronounced upon him, and could not yet realise its full import. He would be safe if Astbury made good his escape—safe from all hint of shame or disgrace; safe from the contempt of the woman to whom he was devoted; safe from the scorn of that good, generous uncle, who trusted him, and had done for him all that the most affectionate parent could have done for a son. He would still retain his position in their esteem; still hold up his head in the City as the future chief of the great house of Ellicott & Co., whose wealth and integrity were undoubted. That reflection roused, but could not console him; for there came with it the bitter knowledge that he had this day hung round his neck the heavy chains of eternal fear and remorse.

A clerk came with a second message, and

Dacon tried to pull himself together in order to endure as calmly as he might the ordeal of the forthcoming interview with the head of the firm, the lawyer, and the detective.

THE OLD-TIME PROSPECTOR.

THE Prospector, as he is called, is as necessary in the mining camps as the farmer is in an agricultural country. Indeed, the discovery of mineral wealth, especially gold and silver, in any country is almost invariably due to the professional prospector. In the United States the most expert of these men are very often old '49-ers' from California. But of course such old-timers are becoming scarcer every year, while the army of prospectors is increasing in numbers; because in every newly-discovered camp novices follow the footsteps of the old-timers, and soon gain sufficient knowledge of the different formations to become authorities on the subject.

It is due to the restless and adventurous spirits of these men that 'stampedes' to unexplored regions in the Far West are organised. It is only necessary to hint that in a certain range of mountains gold ought to exist, to start the prospector on a tramp of discovery. In an incredibly short space of time—a few hours at the furthest—he will pack all his worldly possessions together with a supply of provisions on his burro or donkey; and with his rifle on his shoulder and revolver in his belt, will start out to walk, leading the burro, often a distance of hundreds of miles. His worldly possessions can be easily handled, for usually they only consist of a pair of blankets, pick, shovel, and gold-pan, together with the primitive cooking utensils used in camp. He is at home wherever night overtakes him; he asks no better roof than the heavens, and no softer bed than the earth. Once left a man start to prospect for mineral for a livelihood, and it is very rarely you see him forsake the business for any other. No matter how many new camps he explores, he is always ready and anxious to follow a stampede, even though, as is often the case, it results in failure. An experienced prospector can always command sufficient funds to enable him to follow the dictates of his restless spirit; for capitalist speculators are only too eager to furnish money and provisions in return for a share of the discoveries the prospector may make. This is one of the principal reasons why he seldom becomes a rich man; another is, that he rarely, if ever, saves his money.

Among the chief characteristics of the old-time prospector is his reckless extravagance and generosity. If he makes a rich discovery or 'strike,' he sells out the greater portion of his interest to the highest bidder—usually mining speculators, a class of men who are always watching for investments in rich discoveries which they partially develop, then form stock companies to prosecute the work they have commenced, and usually realise large returns on their investment. The prospector, as soon as he has made his sale, usually lives in clover as long as the proceeds will allow him. The faro banks, dance-halls, and drinking-saloons reap their harvest; his life, as long as his money lasts, is passed in what he considers one continual round of pleasure; and when he is 'busted,' he

packs his burro, shoulders his rifle, and tramps over the hills and mountains once more, in search of another strike.

Throughout the mining regions the visitor will see hundreds of log cabins built by prospectors, and deserted; often you will pass through deserted towns where the log and frame buildings have been left so hurriedly that the shelving and counters still remain in the shops; and the painted signs on the buildings indicate the class of merchandise which had been stored within the walls at some bygone day when the adventurous prospector had made a rich discovery, but one which failed to 'pan out' successfully. One rich strike in a district is often sufficient to cause such a stampede of miners, store-keepers, saloon-keepers, gamblers, and the migratory population to be found in all mining camps, that houses appear to grow like mushrooms. If the strike is developed successfully and other discoveries are made in the vicinity, the town grows very rapidly; but if, on the other hand, it proves a failure, then the town is as rapidly deserted, for the merchants and business men of the mining countries are of the same restless spirit as the prospector, and move almost as rapidly.

What the old-time prospector does not know about practical mining and the tricks and devices adopted to persuade 'tenderfeet' to invest their money, is hardly worth recording. He will point with pride to some hole in the ground which, by salting with gold-dust, he sold to some Eastern capitalist as a discovery of a true fissure vein. He has a profound contempt for the college-educated professors who are often sent by syndicates to examine mining property. He will never acknowledge that men from Eastern cities in the United States are capable of managing a Mining Company successfully. In his eyes, no one but an old-timer from the Pacific slope can ever make a mine pay.

In a word, the old-time prospector is a character. His cabin or camp-fire is an asylum to all travellers; his hospitality is proverbial; no matter how slender his supply of provisions, he is always ready to share them with any wayfarer who comes along, and will consider the offer of remuneration as an insult. His yarns relating to his adventures are always interesting and exciting, if not strictly true. He is never tired of telling of the good days when Alder Gulch in Montana was discovered, and of the dust taken from the 'placer' mines by the early settlers; and is continually deploring the fact that the railroads and civilisation are pushing westward so rapidly; for it is the height of the ambition of your old-time prospector to be as far from a railroad and civilised people as possible.

Among the notable exceptions to the rule that the prospectors rarely become rich or influential men may be mentioned the present United States Senator, George Hearst of California; he is an old '49-er' whose good luck—as they call it in the mines—has never forsaken him; and this, aided by shrewd management, has placed him among the millionaires of America. Although he has become a rich and influential man, yet he will never forget his experiences as a prospector in the days of 1849, when California was first discovered; consequently he has a very soft place in his heart for any brother-prospector who has not been so

prosperous. His love for California is so devout that it approaches idolatry, and I have frequently heard him say that he would rather be governor of that State than President. The old-time prospector never tires of calling his listener's attention to the career of George Hearst or any other successful old-timer, with pride, without the least jealousy; but will invariably finish by telling you where he himself might have been if such and such a discovery had turned out all right.

THE TRUTH ABOUT FOX-HUNTING.

BY ONE WHO HAS GIVEN IT UP.

'My dear fellow, it's most awfully good of you; awfully kind. But I—I make it a rule never to hunt another man's horses—never.' I sit back in my chair as I say this to Pudgewood, whose guest I am, and assume a look which ought to convince him that I am making a sacrifice to principle which causes me profound regret and disappointment; but somehow he doesn't seem to believe it.

'Nonsense, Jones!' he says. 'I'll give you the old gray; he's the quietest hunter I have in the stable. Steady as a house, and as clever on his legs as a cat.—I defy you to bring that horse down, sir!' he concludes, with an emphatic thump on the dinner-table.

Now, strictly between ourselves, it had never occurred to me that there was the least likelihood of my bringing the horse down. Well-founded apprehensions lest it should bring me down prompt my disinclination to accept Pudgewood's offer; but of course it isn't necessary to tell him that. I was speaking the truth when I told him that I made it a rule never to hunt another man's horses; I made that rule long ago, and, never having hitherto met any one who tempted me to break it, have found no difficulty in adhering to it. When I told Mrs Jones to accept the Pudgewoods' invitation to spend a week at their place in Shropshire, I quite forgot that Anthony Pudgewood was one of those few hunting-men who are generous enough to mount their friends. Had I remembered the fact, I should have come to Barnsdale forearmed with a sprained wrist, or something which would effectually prevent a man attempting to ride. It is quite obvious that Pudgewood won't be put off by my plea of 'principle'; so I must try another argument.

'I don't like refusing your offer, Pudgewood,' I say; 'and I should have enjoyed a day with the hounds immensely, but I have brought no riding things with me.' That ought to be conclusive, I think. But no.

Pudgewood casts a critical eye over my figure, and says thoughtfully: 'My clothes wouldn't fit you, I'm afraid.—But, George—you remember my brother George?—left all his hunting kit here, and he is just the same build as you are. I'll lend you some of his things.'

Every loophole of escape seems to be closing up. I cast an appealing look at my wife, who is sitting opposite me. She is a clever woman, Mrs Jones, though I say it; wonderfully ready, and of boundless resource. I give her a glance which is intended to convey 'Help me out of it'; but she fails to grasp my meaning, and helps me a little further into it.

'When Mr Pudgewood is so kind as to offer you a mount, Algernon, I really think you ought to take it,' she says.

'Quite right, Mrs Jones,' assents Pudgewood. 'I shouldn't like your husband to go away from Barnsdale without having a gallop with the Shropshire Hounds. I know how fond of hunting he is; he has often told me of his doings.'

Things are growing worse. I'm afraid I must have given Pudgewood a wrong impression when I talked to him about hunting. My experience of the sport of kings has been that of an onlooker from the seat of a dogcart. I used to enjoy that thoroughly, particularly the lurching part of the day's business, when I was staying up in Shropshire last winter. I have sometimes been for a ride along the road; but I never rode to hounds in my life, and ought to have mentioned the fact, which Pudgewood does not appear to be acquainted with. I wish there weren't so many people present; I really have not the courage to explain how I have gained the knowledge of hunting matters which I have been airing so freely all dinner-time before such a crowd. It would look too foolish.

'I'm desperately afraid that it's going to freeze to-night,' says a young gentleman, drawing aside the window-blind as soon as the ladies have left the room; 'it's looking horribly clear.'

The remark is received with a chorus of indignant dissent, in which I join feebly. Everybody has good reason to believe that it won't freeze; the thermometer has been rising, and the barometer has been steady all day. There's a south wind; and Jinks, the first whip, said only yesterday that there wouldn't be frost again for a fortnight. Jinks appears to be an infallible authority on the weather, judging from the manner in which his opinion is quoted and received. Everybody is soothed by the announcement; and we draw in our chairs, directing scornful glances at the upstart who took upon himself to look out of the window, and who now relapses into snubbed silence. I breathe an inward prayer for at least ten degrees of frost, and try not to hate the unknown Jinks. That is my one hope now; if it freezes I am saved; if it doesn't—

I must confess that there is something about hunting-gear which gives the wearer a feeling of confidence; and as I stand before the mirror in my dressing-room this morning, rigged out in George Pudgewood's buckskins, and top-boots, which fit me admirably, I begin quite to look forward to the day's outing. It didn't freeze last night; on the contrary, there was a little rain, so the ground will be tolerably soft if I meet with an accident.

'I wish you had a red coat,' says my wife, who has come to inspect me; 'and—I may be wrong—but I think, Algernon, you have put your spurs on upside down.'

Mrs Jones's father was a noted hunting-man in the shires, and she ought to know something about these matters.

'Dear me! so I have. Thanks for noticing it. I'll put them right at once.'

They are soon readjusted under Mrs Jones's directions, and I go down-stairs to the breakfast-room. I had no idea it was so difficult to walk down-stairs with spurs on. Twice the

rowels catch in the carpet, and I only save myself from a bad fall by clinging to the banisters with both hands. Finally, I turn round, and walk down backwards, arriving in safety on the mat without being seen. I wonder how other fellows manage, for I don't recollect ever having heard any one complain of this difficulty before.

'Morning, Jones,' said Pudgewood through a stratum of buttered toast. 'Come along; we haven't much time to spare. The meet's at Holly Copse, seven miles away, at eleven o'clock; and it's near ten now.—Will you ride out, or take a seat in the dogcart?'

If I could take a seat in the cart and keep it, I should select that without hesitation; but a little practice in the saddle will do me good, perhaps, so I say that I will jog out quietly.

Pudgewood nods approvingly. 'Always best to ride to cover, I think,' he says; 'you have time to shake down in your saddle before the day's work.'

I hear the horses being walked up and down on the gravel outside, and the sound rather takes away my appetite. I should like to know a little more about the animal I am to ride before I mount, and therefore seize an early opportunity of asking Pudgewood about it.

'This gray, which you have been good enough to lend me, Pudgewood, have you had him long?'

Mr. host screws up his eyebrows and makes a brief mental calculation. 'I've hunted old Diamond now for nine seasons; he's never given me a single fall, and I never knew him turn his head from anything yet.'

'Haven't you, indeed?' I ask faintly.

'Not once,' affirms Pudgewood solemnly. 'He can take a five-foot wall as easily as you could jump over a straw. He loves jumping, that horse.'

Loves jumping, does he? I listen with sickly interest while Pudgewood continues to dilate upon old Diamond's merits. He appears to be a horse of considerable strength of character, from his master's account; and I fear that if he insists upon indulging in his taste for jumping while I am on his back some difference of opinion is likely to arise between us. I do not 'love jumping.'

Pudgewood is certainly a most thoughtful man. He arms me with a huge hunting-crop, whose horn handle, he says, will be useful to open gates with. It's a troublesome thing to carry, and gets fearfully entwined with the reins; but if it is to serve me as a gate-opener, no earthly power shall induce me to leave it behind.

I am mounted now. I felt a little pale when I came out of the house; but the exertion of climbing into the saddle, with the groom's assistance, has made me purple in the face, for I am a stoutish man of no great stature, and not so active as I used to be.

'E's a trifle fresh, sir,' says the groom as he puts my right foot into the stirrup. 'Don't touch him with the spur or ride him on the curb, and he'll go like a lamb.'

The horse is tossing his head and champing his bits with most unblinking ferocity; indeed, his whole demeanour warns me to treat his peculiarities with the utmost respect. I screw my armed heels painfully far outwards, to keep the spurs off

his sides, and pick the bridle up very gingerly; I won't pull the curb-rein for any consideration. I try to look comfortable and happy as Pudgewood rides up beside me and gives Diamond a long loving look over from his head to his heels.

'He will carry you splendidly,' he says to me. 'I shall expect to see you in the first flight the whole day.'

It's far more than I expect myself. I am not at all ambitious to be in the first flight—whatever that may be—and don't mean to let Diamond jump so much as a drain if I can help it.

The horse calms down by-and-by; and when we pull up at the cross-roads where the hounds are waiting, I feel much more at home in the saddle than I did when we started. There are at least fifty horsemen standing about, and numbers of carriages full of ladies. Everybody looks so animated and jovial, that I make a spasmodic effort to appear pleasantly at ease. I'm afraid the attempt is rather a failure, for the sight of the hounds has roused Diamond's spirit, and he is very anxious to be off. Presently the whole cavalcade is streaming slowly up a muddy lane behind the hounds; we pass through a gate into a large field; and the master, aided by the huntsman and whips, sends the pack into cover.

Pudgewood trots up to give me a final word of advice: 'Don't touch his mouth once you put him at an obstacle; let him take his own pace, and you are quite safe.'

I nod a despairing affirmative; somebody beside me says, 'They have found,' and I sit in awful suspense awaiting the result. One of the whips appears at the corner of the wood into which the hounds were sent, and holds up his cap. Men throw away their cigars, button up their coats, and press their hats well home. I feel dreadfully limp as we trot towards a white gate in the corner of the field. Suppose it won't open, and that I am called upon to put Diamond at the railings? They are nearly three feet high, and look awfully strong. The gate is not locked, however; and when we get through it, we see the hounds pouring out of the wood, noses down and tails up. 'They've got the line,' says a man near me; 'come on.' He canters away, and in ten seconds more we are all galloping across the pasture after him. My hat gets over my eyes, and I can't see anything; I have lost a stirrup, and in my frantic plunges to recover it, I have spurred Diamond to the top of his speed, in what direction I have not the least idea.

'Hold hard, sir!' bawls a man as I flash past him; but I am oblivious to all things save the certainty of tumbling off if I don't get that stirrup back at once. 'Ware hound!' screams some one else, as a shapeless splotch of liver and white, which I subsequently ascertain was a hound, appears below Diamond's hoofs, and howls piteously as we pass over it. I have got all the reins and my whip in one hand, and am holding on to the saddle like grim death with the other. Suddenly the stirrup swings itself back on to my foot again, and with a supreme effort I succeed in pulling the horse up. I don't like to look round. I hear floods of opprobrious language levelled at me, at which I must say I'm a good deal surprised, as I have always been told that the hunting field is the school for manners.

'Perhaps, sir,' says an old gentleman in whom I recognise the person Pudgewood pointed out to me as the Master of the Hounds, 'if you cannot control your horse, you had better keep well in rear. You have already disabled one of my hounds.' He says this very authoritatively, and canters on without paying the least attention to my apologies. I quite agree with him about keeping in the rear, and shall be perfectly satisfied to stay there if Diamond will consent to the arrangement.

After we have gone a good long way, every one stops galloping, and I come up with the rest of the field. I am stared at a good deal, I don't know why, and I hear something said about a cheque, which I suppose relates to that stupid dog I rode over. It rather damps my ardour, for I have got on surprisingly well up till now; there has been no jumping, for all the gates are open, or there have been friendly gaps in default. I have been abused sometimes for not awaiting my turn at these places; but I can't explain that the anxiety to get on is all on Diamond's part and not on mine. I am glad to stop for a bit; but in a few minutes a man says, 'They've hit off the line,' and we are all thundering down towards a hedge of most forbidding aspect, and without a gap in its whole length. 'Now, then, Jones,' sings out Pudgewood cheerily; 'sit down, and give the old horse his head.'

The advice is well-meant, but unnecessary; the old horse has got *his* head, but I have quite lost mine. We are at the hedge; there is a frightful lurch, and I am hoisted into mid-air, vaguely conscious that the saddle on Diamond's back is far away below me. After a wide parabolic aerial flight, I come down lengthways on the horse. Thence I rebound helplessly; and the next thing I am aware of is, that I am sitting in a very wet furrow, with my legs stuck straight out before me, scraping the clay off my face. I don't know where the horse has gone, and I don't want to know. I have had quite enough hunting for one day, and as soon as every one is out of sight, I shall make the best of my way homewards.—I find the road, and set out on my walk to Barnsdale, which must be a good eight miles off. Never mind; it's better than hunting.

Hallo! what's this? I am tramping steadily on, whistling to keep up my spirits, when the sound of hoofs falls on my ear, and sends a cold shiver down my back. It comes nearer and nearer, and my heart beats like a hammer, keeping time with the hoofs. I daren't look round. I *won't* look round. Pooh! after all, perhaps it's only a farmer on his way home. The villainous Diamond is not the only horse in Shropshire. But even as I try thus to comfort myself and ward off apprehension, the animal comes up beside me, and a gruff voice says: 'Yer be thy harse, Meister.'

It is too much. I throw common-sense and truth to the winds at these appalling words, and repudiate ownership as fiercely as though I had been accused of stealing the creature.

The yokel on Diamond's back stares at me with his mouth open, in stupid amazement, for fully half a minute. Then he takes off a very old hat and scratches his head, as though friction assisted speech. 'But I see'd thee a-tumblin' off 'im in

the field tree mile back. Me an' my mate was harf a hour a-ketchin' of 'im.'

What am I to do? The man knows that the horse is mine, or that I was hunting it, and evidently doesn't mean to be balked of his expected tip. One point I am quite decided upon: I will take this countryman into my confidence; I will eat my humble-pie to the very last crumb if need be, but I *won't* ride that fiend miscalled a hunter home. That is a thing I will not do. But I wish I hadn't told the man that the horse wasn't mine. Never mind; it doesn't matter. I will offer him five shillings to take Diamond home for me and say nothing more about it. With this determination I stop and pull some money out of my pocket; the labourer sees it, stops Diamond, and before I can prevent him, has dismounted, and is holding the bridle ready for me to get up again.

'Now, look here, my man,' I begin. 'I want you'—

But the words die upon my lips. Just as I press the two half-crowns into the labourer's willing hand, there is a confused clatter of hoofs, and three men in pink come swinging round the corner. I will wait until they pass. Oh the mistaken kindness I have suffered from, to-day! They don't pass; they pull up with one accord, and hope that I haven't come to grief. I disclaim all need of aid and sympathy with frightful eagerness; but in vain. My hollow tones arouse their pity, and one of them jumps off his horse, and taking Diamond by the head bids the rustic 'help the gentleman mount.' The labourer seizes my left leg in a giant's grip, and I yield myself to fate, silent for very shame. The three officious good Samaritans ride with me just far enough to let the retreating labourer get well out of sight with my five shillings, and then bidding me good-evening, turn up across the open moor, leaving me to my enemy's mercy.

I am bound to admit that he goes more sedately now. How I would thrash him if I only dared! Fortunately for him, I would as soon try to fly as take such a liberty, and he is allowed to plod along as slowly as he chooses. By-and-by he begins to go very awkwardly; he stumbles and trips, until I am in momentary terror of being thrown over his head. He must be lame; and as the awful possibility, nay, fact, bursts upon me, I pull at the bridle till I get him to stand still; and climb down to see what has gone wrong with him. I can't see anything unusual about any of his legs; but there is no disguising the hideous fact that he is dead-lame. I don't waste time in making further investigations; I throw the bridle over my arm, and once more set out to walk home, with the horse limping behind me. I am dog-tired, very hungry, and my body aches from innumerable bruises. I begin, moreover, as I near the house, to feel that my personal appearance is rather depressing. My hat (new a week ago) would make an Irish beggar blush; my once spotless buckskins are boldly variegated with blots and patches of brown and green till they resemble a carelessly drawn map. Diamond and his trappings are no cleaner, and we are indeed a sorry procession as we enter Barnsdale gates at sunset and are received by Pudgewood at the hall-door.

'Hallo!' he says, 'why did you walk home?'

'He's lame,' I respond in a ghastly whisper. 'Lame!' shouts my host, rushing down the steps and diving at Diamond's legs—'lame!' He feels each limb in turn, and then examines the hoofs, while I stand trembling like a pickpocket's apprentice caught in his first theft. Presently Pudge-wood draws out his pocket-knife and with two taps knocks a stone out of Diamond's forefoot. Then he stands upright and pats the horse's neck. 'Jones,' he says with the gravity of a man whose painful duty it is to bring a serious charge against his best friend—'Jones, I'm afraid you're a duffer.'

And I am too completely crushed to reply.

I have never ridden to hounds since; and when fellows begin to talk hunting at dinner, I am silent. I consider that hunting as an amusement is greatly overrated.

THE SENSE OF HUMAN BROTHERHOOD.

Most of George Eliot's readers will recollect, and some know by heart, that very pathetic passage in *The Mill on the Floss*, where Maggie Tulliver, resisting Dr Kenn's advice to stay on at St Oggs, replied with great earnestness: 'Oh, I *must* go.' It seemed, says the writer, that she had told him her life's history in these few words. 'It was one of those moments of implicit revelation which will sometimes happen between people who meet quite transiently, on a mile's journey perhaps, or when resting by the wayside. There is always this possibility of a word or a look from a stranger to keep alive the sense of human brotherhood.' Dr Kenn understood in a moment that deep meaning and intention lay beneath these four words of Maggie's. It is one of the subtlest and most beautiful traits of the mind, this swift and mystical power of interpretation vouchsafed at certain moments of our lives to most of us: a single flash of the eye, or a few earnest words with perchance but little outward meaning, may communicate to a stranger a world of sorrow, a hidden depth of feeling. If it be sorrow that is hidden, then, like murder, it must out. A man may proudly lock up his grief in his inmost self, so that even his nearest friends may not suspect it; but suddenly, at an unguarded moment, as it were, the truth lies bare to a stranger. Often enough a gentle word or look is sufficient.

We English, are we not the proudest, coldest people in the world? For hours together, a dozen people may be congregated in a railway carriage without uttering a word to each other; each, perhaps, is shy of breaking the ice. And probably the higher you mount the social ladder, the further you will find this conventionalty carried. Most people have heard the conventional tale of an Oxford student who refused to save a drowning fellow-collegian because he 'had not been introduced.' And yet through all this, human nature is ever thrusting and reasserting itself—bursting through the frail web that society weaves around us.

Strange faces, and even voices, often exercise an undefinable glamour over us. After the lapse of many years, a face occurs to us again and again, not only for a few brief minutes—perhaps a

station: that once our eyes met, never to meet again, and straightway a quick understanding, nay, more, a dumb friendship sprung up between us. We still, at this day, see the face and meet the eyes while the train steams slowly away, and in a few moments is but a black dot in the distance.

Other well-known and oft-seen faces that we strive to recall either elude us, or flash dimly for a second on the mind's eye. As Tennyson so beautifully says:

I cannot see the features right,
When on the gloom I strive to paint
The face I know; the hues are faint,
And mix with hollow masks of night.

A curious thought this—two beings drawn gradually towards each other by countless chances, meet for a brief minute, and part again for eternity.

We see around us daily forms and faces for which we care nothing, whose presence we would often too readily dispense with, while in the obstinacy, as it were, of our natures we persistently regret the one face that we shall not look upon again—in this world, perhaps; and if we did, and were not in turn recognised, would not the disappointment be the keener? Forthwith the idol that we had cherished would fall broken to the ground.

This is an age when science and reason are working to divest us of all but their own unalterable truths, and when many an idea cherished from youth must stand confessed before the light of science as a mere fancy or illusion. Perhaps, then, there are few who will not attribute this undefined influence of strange men and women over us simply to that inherent desire for change and novelty deeply rooted in the nature of mankind. But to some few there may seem to be a deeper reason, namely, the 'sense of human brotherhood,' of which George Eliot speaks: a fact which, if it be true, does high credit to our natures, serving, amongst other ends, to give the lie to the cynic who wrote that men were to each other as wolves.

H O P E.

A SONG.

Oh, chide not Hope, though she deceives
The trusting heart so often;
The music of her whisper leaves
A spell our woes to soften.
She is not false! Her mission rare
Is this, to cheer by smiling;
For nought like Hope can lighten Care,
Whatever her beguiling.

Oh, paint her still the maid we know,
Upon her anchor leaning,
With sunshine on her lips, and brow
Aglow with joyous meaning.
Rebuke her not, lest with a sigh
She leave you in your sorrow,
And dread Despair, still hovering nigh,
Usurp her sway to-morrow.

PRICE 1½d.

'BRIGHT STAR OF VENUS.'

CONSPICUOUS at present in the western sky is a star of great brilliancy. By those who even casually observe the phenomena of the sky, it cannot fail to be noted, all the more as it has lately increased much in brightness and risen higher in the evening sky. It is the Hesperus of the ancients, Shakespeare's 'bright star of Venus,' coming now into a more favourable position for evening observation than it has occupied for years. This planet has always been a favourite star with the poets. Milton describes how, when evening fell over Paradise, 'Hesperus, that led the starry host, rode brightest;' and in the same poem he speaks of it as

The Star
Of Hesperus, whose office is to bring
Twilight upon the Earth.

Hence, it may at this time interest our readers to learn something of this celestial wanderer, so prominently thrusting itself on our attention in the evening sky.

And first we may note the reason for the present brilliancy of the planet, which brilliancy will go on increasing until near the end of March, when it will probably astonish many of us and cause considerable wondering and inquiry. This excessive light is not due to any increase in the actual luminosity of the planet's surface; there is but little change in this, and that little is due to its slight approach to or recess from the sun in its orbital course. Its present radiance is wholly apparent, and due simply to its position in the sky with reference to the sun. We have ourselves seen Venus with the naked eye at two o'clock on a July afternoon, when it was almost right overhead in the blue heaven; yet at that time it was hardly noticeable in the evening, as it set so near the sun as to be dimmed by the glare of the twilight. It was intrinsically as brilliant then as now, only at its present appearance it is so placed as to remain visible for a long time after sunset. It is thus projected on

a very dark sky, and brightens strongly upon the eye by the contrast.

The movements which lead to this result are curious and interesting. If we could have the sun remain still in mid-heaven during one period of the planet's motions in the sky and could follow the latter with the eye, we should see something like this: Suppose Venus first placed away to the west or right-hand side of the sun, we should see it gradually approach the latter, becoming feebler in light as it did so; then passing the sun, it would slowly swing away to the east (or left-hand), becoming brighter and brighter, until it had gone, like a pendulum, as far in that direction as at first it was away to the other side. Still becoming brighter, it would commence its returning course towards the sun, until at a certain point its brightness would be at a maximum; then it would swing on, becoming almost invisible when passing the sun, until it had attained its first position on the extreme right. In its most simple aspect this motion is just that of a pendulum, the planet sweeping across the sky from side to side of the sun, only the motion is slow, taking about two hundred and twenty-four days for a double swing.

Now, in order to see how this motion affects the planet's evening brightness, we must note that the path it pursues is not directly across the sky from east to west, but at present it is diagonal; the planet, swinging eastward, swings also away up to the north—up over our shoulder, as it were, as we look south, so that, while it is increasing in brightness, it is also getting farther from the sun and farther northwards in the sky. Now, we know that the farther the sun gets north the longer he is in setting and the longer are the days. So the farther north Venus gets the later it is in setting; in other words, the sky has a longer time to get dark after sunset before the planet sets, and it is projected on a darker ground. Hence the later in the evening the planet sets the brighter it will appear.

But our readers will have noted that we spoke of its brightness changing as it moved; so, if we could only get a late setting-time for the planet conjoined with its time of maximum brilliancy, we should get the best possible effect of apparent light. Now, this will very nearly be the case at present. On the 25th of March it sets at about 10.30 p.m., while on the same day it is at its greatest brightness, and for several days at that time will form a splendid object, in a moonless sky. It will make a very good lesson in astronomy if our readers watch this remarkable change. Get some fixed object, hill, tree, or house, behind which the planet appears to set when you are standing at a certain point. Go back to the same point once or twice a week during the spring months, and note how many minutes later it sets every time until about the 22d of March. After that it will set earlier every evening with increasing rapidity of change until it is lost in proximity to the sun early in May. A simple exercise like this will do more to impress on the mind some facts of astronomy than the reading even of many books on the subject. It will let us actually see, for example, that the sun as well as the planet is in motion over the sky.

When the planet begins to set earlier each evening—that is, after about March 22—its change of time in setting is enormously more rapid than before. In fact, it set about 7.40 p.m. on 1st January last, and will take until March 22 to reach its latest setting-time, 10.35 p.m. (Greenwich time)—that is, nearly three months for a change of two hours fifty-five minutes. But in its return to earlier hours of retiring it will make such speed as to set at 7.38 p.m. on the 1st of May, doing nearly the same amount of change in about six weeks which before took nearly three months. This difference is due to the sun's motion. In the first case, Venus was, as it were, running away from the sun, while the sun pursued it, and the 'stern-chase' was a long one. In the second case, Venus will be travelling back towards the sun, while the latter still is coming on in his grand yearly course over the heavens, and the two will rapidly approach each other.

While watching these graceful windings of the planet, we naturally inquire as to its real condition. Readers are familiar with the idea that it is a world like our own earth, travelling in a smaller but otherwise almost similar orbit around the sun. On more minute inquiry we find that the likeness between it and our earth is in some points very great—greater, in fact, than in the case of any other planet. In the fundamental element of size they are almost alike, our earth being seven thousand nine hundred miles in diameter, and Venus seven thousand five hundred. The force of gravity on the surface of the latter is very nearly nine-tenths of what it is with us. Its density is almost the same fraction of that of the earth. These facts show that if transported to the surface of Venus we should feel more at home, so far as some essential features of experience are concerned, than on any other planet known to us. We should weigh just about nine-tenths of our present weight, and should find distances bearing much the same ratio to our muscular power of walking that they do in this world; while in all probability the surface rocks and

earth, if such be formed there, would be compacted and constructed like those we daily see around us. This would not be the case on planets so much smaller than the earth, as Mercury or Mars, or so much larger, as Jupiter, Saturn, or Neptune. Again, the year on Venus would be about two hundred and twenty-five days in length, a good deal more like what we have on the earth than is the case on any other planet. In the length of the day we should find a still more home-like experience, as the difference would be imperceptible except to careful observation. Venus rotates in twenty-three hours twenty-one minutes twenty-three seconds, and the earth in twenty-three hours fifty-six minutes four seconds. The day, of course, depends a little on the motion of the sun in the sky, but the difference between this as seen on our earth and from Venus would not appreciably affect the similarity of the days in each. These likenesses to the length of our day and year and to our world's density would cause a similarity, in all probability, in the important matters of mountain-form and of vegetation. In fact, so far, Venus is nearly the twin sister of our world.

But on turning to the scanty information collected by telescopic study of the planet's surface, we are baffled and confounded at the very outset. No planet has promised so much to the telescopic observer and performed so little. Its great light seems to indicate that any details on its surface will be easily seen. But on examination, the light is found to be too great, and no way of usefully reducing it has been found. The planet in a powerful telescope simply dazzles the eye, unless observed in the daytime, and then the eye has difficulty in discerning minute details. Indeed, the wonderful brilliancy of the surface and its whiteness are peculiar, and due to some physical arrangement not yet perfectly understood. The surface of the planet Mercury is between three and four times more brightly illuminated by the sun than that of Venus, and yet Mr James Nasmyth, observing them when close together in the field of his telescope, found that Venus shone like silver, while Mercury, by comparison, appeared like lead or zinc. This great brilliancy exaggerates the unavoidable defects of all kinds of telescopes hitherto invented, and is a great hindrance to the observer.

In the endeavours to explain this phenomenon, it has been conjectured that it proceeds from a cloudy envelope, surrounding all the planet, and turning to us its 'silver lining.' If this be the case, this cloud-canopy must prove a strong protection to the planet's surface from the intense solar radiance. It has been carefully calculated that such a cloud-canopy or envelope, in order to shine as it does, must reflect at least seventy-two and a half per cent. of the light falling on it from the sun. It would act thus like a solar helmet or artist's white umbrella, which are cool beneath in proportion as their white outer surface reflects the sun's rays. Even then, if the supposed cloud-canopy of Venus absorbs no light, it will only suffer twenty-seven and a half per cent. of what falls on its outer side to reach the planet's real surface below. The rest will be reflected in all directions through surrounding space. We may therefore roughly say that of the whole sunlight falling upon Venus only one-quarter will

reach its true land surface. And this question would equal about one-half of that received by the earth. Whether this theory be correct or not, it is certain that the visible surface of Venus is much more uniformly brilliant than it would be if it were either land or water such as are familiar to us. Our twin planet here fairly baffles scrutiny.

Still, various curious markings and appearances have been noted from time to time; for example, there is strong evidence that the planet is surrounded by a very dense and peculiar atmosphere. We know that the twilight which follows our sunsets is partly due to the refraction of the solar rays by our atmosphere. These linger longer on our clouds, because, coming past the horizon behind which the sun has sunk, they are bent downwards towards the earth. Hence the zone of twilight is enlarged and the time of twilight lengthened.

We have seen that Venus has nearly the same gravitational power as the earth. With a similarly constituted atmosphere it should have similar twilight. Now, we can see the twilight effects on its surface very distinctly. When it turns to us one half of its disc dark and the other light, like the moon in her first quarter, we can see the dim zone between the two where twilight lies, and measure its breadth. Studying this, we are met by the astounding fact that twilight has been seen to extend over the whole dark side of the planet; so that, when in crescent form, Venus has appeared like the young moon in the appearance familiarly known as the 'old moon in the new moon's arms.' But though the appearances are similar, their causes are different. The old moon shines on the new moon's crescent because it is illuminated by reflected light from the earth; but for Venus there is no reflected light strong enough to lighten her darkened side. Hence we conclude that her atmosphere is nearly twice as dense at her surface as ours, and is nearly twice as effective in refracting light. Apparently it will never be quite dark on this every way luminous globe.

It is possible, however, that this glow seen on the planet's dark side may be due to phosphorescence of the cloudy envelope or of the surface itself. In that case we are presented with a physical effect so curious and on so large a scale as but to emphasise our ignorance. It is as if half the world were covered with 'luminous paint!' Other indications confirm, however, the conclusion that Venus possesses an excessively dense and refractive atmosphere. These are chiefly the appearances presented when the planet crosses the sun in transit. Altogether, the dense air is most probably the real cause of the glow we have considered. And here again we are baffled when comparing such a world with our own. Another curious fact is that, while Venus waxes and wanes just like the moon, and from a similar cause, she does not do so regularly. When her light is waning, the lightened part of her disc is smaller than it ought to be, and the same is the case when her light is growing; so much so, that the different phases are respectively several days before and behind their proper time. Here, again, we have a problem difficult to solve, and indicating great difference between this planet and our world. Attempts have been

made to measure irregularities which from time to time show themselves on the surface of Venus. These have had such astounding results that we are led to doubt even what is attested by many competent observers. One mountain which MM. Arago and Bouquet de la Grye measured was given as sixty-five miles in vertical height! Schröter thought he saw another with a height of twenty-seven miles!

But perhaps the most remarkable fact of all is the detection of what appear to be polar snows, or at least patches, surrounding the planet's poles, which are brighter even than the rest of that bright globe. It is probable that conjecture as to a world so strange to us is at present nearly futile, and that time and patience alone can solve its mysteries.

JOHN VALE'S GUARDIAN.

CHAPTER XII.

WILL had his doubts as to the sufficiency of the distance between his new quarters and Castle-Barfield. London, both by reason of its magnitude and its distance, looked safe, and Warwick looked too small and too near to afford a secure hiding-place. But John's evident contentment with Madame's proposals, and the limited extent of his own funds, combined to persuade him; and before the little party left the dinner-table it was decided that Will should become a candidate for the vacant situation; so he and Mr Orme left the house together in search of the latter's employer.

Mr Orme, with his greasy hat set rakishly on one side, and his shabby neckerchief fluttering in the April wind, shambled on in silence for a time with his left hand in his trousers' pocket. A slow chinking of coins there, and an air of profound reflection in his face, seemed between them to indicate a close calculation of ways and means. The result would not have appeared to be altogether satisfactory, for Mr Orme, with a long-drawn sigh, withdrew his hand from his pocket and passed it across his lips, shaking his head somewhat dolefully meanwhile. His shuffling step took a more decided accent; but by-and-by the hand stole irresolutely back to the pocket, the slow chinking of coin began again, and his moist eye took once more the far-off glance of profound calculation.

'Your name, I believe, is William,' said Mr Orme, returning to a knowledge of common things, though still partially absorbed—'William. Ah! yes. Exactly. William. Quite so. I have a call to make, William, a call to make. You will wait here for a moment; I will not detain you longer.' The call he had to make was at a corner dram-shop. He was out, again in less than a minute with a bright and satisfied air. 'The gentleman was not there,' he murmured, smoothing his bibulous lips; 'I shall have to call again.'

Will marched on unsuspectingly beside him, and in the course of a few minutes found himself standing in a disorderly and unprosperous-looking stationer's shop, where a long limp man, with an aspect of resignation to unnumbered sorrows, sat behind the counter.

'I have found a boy who will probably suit you, Mr Varley,' said Mr Orme.

The long man arose limply and looked over the counter at Will, and sank back again despondently, as if the spectacle were almost too much for him. 'Very well, Mr Orme,' he said mournfully. 'You can teach him his duties; and if the boy likes he can begin at once. The wages are five shillings a week, and the hours are from eight to seven, with an hour from one till two for dinner, and half an hour from five till half-past for tea.' He made this brief announcement as if it were of the most sorrowful import in the world, and added with a heart-broken resignation which depressed Will's spirits for the remainder of the day. 'Saturday is a half-holiday.'

Mr Orme, being one of those people who find it difficult to bring an interview to a close, lingered for a while, and inspected the dusty cheap periodicals on the counter. He had a look of having something upon his mind which it was necessary to say, and of being shy of saying it. The look lasted until he had touched every article on the shabby counter, and then, with a sudden air of having said the thing, he shuffled off, taking Will in his train. They passed behind the counter and entered the domestic precincts. 'A whole tribe of children were playing at horses in the passage, and a boy of eight or nine nursed a Japanese idol of a baby whilst he drove in a harness of knotted cord a herd of six. Mr Orme becoming entangled in the harness, the team resolved itself into a body of Mayday dancers, with the new arrival for a maypole, and circled round him with obstreperous cries. This entertainment lasted until the sorrow-stricken proprietor of the establishment appeared upon the scene, when the children went suddenly quiet; and Mr Orme, released from his entanglement, took his shambling way into a weedy little desert of a garden, with a pigsty at one end, and a small barrack-like building of two stories at the other. The windows of this edifice were made of small square panes, which overlapped each other, and a fair half of them were broken. The breakages were patched with papers of all colours, so that each window had the look of a polychromatic advertisement sheet with half the divisions blank.

Such a limited wilderness of disorder as the interior of this building presented Will had never seen, or so much as dreamed of. A little regiment of broken and battered ink-cans stood in one corner, and every one of them seemed to leak—a thick gummy exudation of red, blue, black, green, and mauve. In an opposite corner was a great pile of waste-paper, into the base of which the waste water from a washing sink had run, apparently for years past, so that for nearly a foot upwards the paper was yellow and rotten with moisture. There were two old-fashioned printing-presses grimy with ink and oil, and rust and dust, and looking as if they had been unused for a score of years past. Half-a-dozen rough wooden tables leaned forlornly to this side or that, their surfaces encrusted with old dirt. And the square brick-work of the floor was splintered everywhere, as if it had been beaten with a hammer.

A shaky flight of stairs led to an upper room, the crazy confusion of which made the apartment on the ground floor almost orderly by contrast. The unevenly boarded floor was half an inch deep in mourning under dust and ashes, and numberless little formes of type had been set upon it to be

kicked into disorder. Ramshackle shelves laden with worm-eaten wooden types held an insecure and precarious hold upon the walls; cases of metal type, meagre enough in number, stuck out from a rack at every conceivable angle; and every case seemed to be employed as a shelf for flat bottles, broken clay pipes, neglected granitic crusts, old pamphlets, tattered newspapers, old slippers, and half-a-dozen other ragged, tattered, and disgraceful articles of attire. A stone surface near the front window was cracked from end to end, and covered all over with an assortment of types of every size and character the place afforded.

In the middle of the room a stove was burning. It had at one time been too far heated and allowed to cool too suddenly, so that its cast-iron sides had broken into a blistered yawn, and the upper part was half severed from the lower. It was mounted insecurely on a shallow pan of sheet-iron, crammed full and overflowing with yellow ashes; and the pan in its turn was raised from the floor by half-a-dozen broken bricks. The stove-pipe was maudlin drunk, to all appearance, and awayed so far out of the perpendicular that it would have fallen but for a wire-hook, which, suspended from a piece of knotted string, hung from a rafter in the roof. Its wretched joints were held together by pasted brown paper, discoloured by heat, and in places almost dried to tinder. The leaky gas brackets had been repaired in the same orderly and efficient manner, and it would have been difficult to invent any sign of laziness and shiftless shift which the place did not include within its limits.

Mr Orme, removing his hat and coat, rolled up his sleeves, and ducked his head through the tape of an excessively dirty black apron. Will thought at first that this article had gone black in service; but a second glance assured him that the black was genuine and original, and that only the grayer tints upon it were the results of employment. When he had inducted himself into this workman-like garment, Mr Orme lit a pipe, and setting a shallow oblong box on end near the stove, took his seat there and smoked like a man on duty. 'If you've got any ambition, William,' he said, 'this is the shop to come to. Here's your avenue.'

'It's a printing office, isn't it, sir?' asked William.

'That's what they say outside, my boy,' responded Mr Orme.—'You haven't got an apron, have you? Well, you'll have to get some. In the meantime, you can go down-stairs and find a sheet of stiff brown paper and a piece of string.'

William did as he was bidden; and Mr Orme, first telling him to take off his jacket and roll his sleeves up, tied him in the brown paper wrapper as if he had been a clumsy parcel. When he had done this, he surveyed William with critical approval, and fell into a doze over his pipe. He woke from this to instruct his new lieutenant to feed the fire.

'And now,' he said, 'you're going to be initiated into the mysteries. Give me that sheet of copy on the longprimer upper case.'

William, discerning what he wanted by his glance and gesture rather than his words, brought him a thumb-marked scrawl, which he perused sleepily.

'Take that stick,' he said.—'No; not that

thing. The slip of mahogany with a brass slide on it.—Now, you see the bottom rack, left side; pick the word "furniture" out of that.

The letters in the rack were all higgledy-piggledy, and half of them were face downwards. By dint of five minutes' searching, Will found the necessary letters, and arranged them in the wooden composing-stick.

'Bring it here,' said Mr Orme. 'That's lesson number one. You've got all the letters turned the wrong way; but that's all proper and natural for a beginner. That's how they stand—on their heads. Do you see? If they didn't stand on their heads in type, they'd stand on their heads on the paper, and then anybody who wanted to read the bill would have to stand on his head to do it. The doctors won't allow that, because they say it's unwholesome for elderly people. Now, I want "Monday, May 10." You can get that out of the fat expanded Egyptian.'

'Yes, sir,' said Will, and stood expectant. Mr Orme, in his intense enjoyment of his pipe, dozed a little, and woke up with a start.

'Well,' he said, 'have you got the date?'

'No, sir,' said Will. 'You didn't tell me where the—the gentleman was, sir.'

The tutor twinkled all over, and taking a fallen cinder from the stove fire, threw it dexterously on to a line of dirty metal type.

'That's the fat expanded Egyptian.—"Monday, May 10." Put a comma after Monday, and another after 10.'

'I can only find one comma, sir.'

'Put a full point, then,' said Mr Orme. 'They'll think the tail has broken off. Put the full stop after "Monday;" it'll look more natural. Now you see, William—your name is William, isn't it?—you're learning the art and mystery dirt cheap. If I were selfish, I should do all this myself, and keep you in the dark. You understand that, don't you, William?'

William said 'Yes, sir' quite smoothly, but had his own opinion none the less.

When Mr Orme had made William do all that a boy so un instructed and inexperienced could manage, he went lingeringly and unwillingly to work himself, and William stood by to assist, handing him all manner of oddly named articles: little bits of battered wood that were for some no-reason called 'furniture,' hollowed cubes of metal called 'quotations,' and finally being despatched in search of a mysterious article called a 'shooting-stick,' which turned out to be a degenerate splitting of boxwood bluntly frizzled at both ends.

This brought Mr Orme to tea-time; and Will was despatched to the house with a teapot, which, like everything else about the printing office, was beaten out of shape and discoloured by long service, with instructions to get it filled from the kitchen with boiling water. Mr Orme kept a little assortment of tin cans for tea, milk, sugar, coffee, and the like, and had a small loaf, a pat of greasy butter, and a rusty, broken-bladed table-knife in a drawer. From these materials he made a meal, singeing slices of bread on the top of the stove, and growing quite unctuous and shiny with warmth and butter before the repast was over.

A fat watch this industrious workman carried seemed chiefly useful because it could be made to

indicate any hour its proprietor desired. He generally beat it upon his knee and held it to his ear before consulting it; but he professed as great a faith in it as if it had been the clock of a cathedral or a Greenwich chronometer. The minute-finger was dislocated, and could easily be induced by a persuasive shake to go backwards or forwards five minutes at a time, so that Mr Orme, by shaking it forwards once before tea-time and twice backwards after tea-time, secured an extra quarter of an hour's idleness, and at the same time comforted his conscience with a sense of the strictest punctuality.

When a proof-sheet of the auctioneer's bill had been pulled, a process in which Will was profoundly interested, Mr Orme put on a huge pair of spectacles and read the printed document solemnly aloud to the boy, who checked it by the manuscript. Divers corrections were made, and Will was then sent down to the shop with a revise. He had left Mr Orme apparently in the highest spirits, and was surprised to find him seated in an attitude indicative of the greatest personal discomfort at the bottom of the crazy stairs, where Mr Orme not only rocked himself to and fro with great violence, but emitted a very hollow and sepulchral groan. His assistant became really anxious and alarmed, and proposing to summon their employer, actually set off for that purpose. Mr Orme darted out after him with an unexpected agility and called him back.

'Don't tell the governor, William,' he besought him with a serious mien. 'If Varley knew that I was subject to these attacks—I don't want to take his character away, but Varley is not a sympathetic man, William—if he knew that I was liable to this, he might suppose that I was not quite equal to the work. I can endure it, William; I can endure in silence.' He had dodged out after William into the weedy little garden, and now went back into the office, leaning heavily upon his shoulder, and uttering low moans expressive of suffering and fortitude.

'Isn't there anything that would do you good, sir?' asked Will, to whom these distressing symptoms were altogether novel.

'There is a remedy,' Mr Orme replied, with a writhe so complicated and so agile that in a man of his figure it was quite phenomenal—'there is a remedy, but it is costly. I have expended too much in charity this week, William; but to-morrow is pay-day, and I had hoped from the symptoms—I am familiar with the symptoms—that the attack would have delayed itself until at least to-morrow evening.' Then he groaned again, and laid himself out face downwards upon the waste-paper heap, where he groaned at intervals like a minute-gun.

'Can't I do anything for you, sir?' asked Will, whose unsophisticated heart was quite pierced with sympathy.

'No, no, my child,' Mr Orme answered in a voice of anguished resolution. A moment later he straightened himself, and averting his head and grasping his waistcoat with both hands, abandoned himself to soliloquy. 'To think,' he said, 'that I should suffer thus for the want of ninepence.'

'O sir,' cried Will, 'I've got ninepence!'

'You have?' cried Mr Orme wildly. 'You

will preserve me. Run up-stairs. There is a flat bottle. A cork rim inside. A glass stopper. Seven cases down from the top, beneath the stove-pipe.'

Will tore up-stairs with an agitation perhaps more than equalling Mr Orme's own.

'Run!' gasped the sufferer. 'They fill the bottle for niapence. Turn to the left as you leave the shop, and the place is at the corner.'

The mere prospect of the remedy did Mr Orme so much good that he rose with every trace of his disorder banished, and, to the tune of *Vilkins* and his *Dinah* waltzed slowly and solemnly round one of the rickety tables. He was dreadfully faint and ill again on the messenger's return, however; and it was not until half the contents of the bottle had disappeared that he could persuade himself that all fears of a relapse were at an end. By this time he had mounted to the upper story, and was well enough to sit by the fire, and even to smoke a pipe, whilst he sipped rum-and-water from the gillipot in which he had taken his rum-and-water an hour earlier.

'Alcohol, William,' he said with impressive solemnity, 'is one of the most valuable of therapeutic agents. Like fire, it is an excellent servant, but the worst of masters. I use it medicinally myself, and I find, employed in that way, that it does me good.' He arose with the apparent intent of stowing away the bottle, but was so suddenly arrested by an unexpected renewal of his pains, that he was compelled to finish it upon the spot. 'Say nothing of this at home, William,' he said, as he restored the empty bottle to its place. 'I prefer to suffer the pangs which are occasionally incidental to approaching age in silence—in solitude and darkness, William. I would not willingly become an object of compassionate scorn.' His solemnity was so great at this moment that his speech was scarcely so clear as it had been, and the weakness superinduced by his suffering was so marked that he tottered a little in his gait. 'Be careful, William,' he observed, with an almost fearful earnestness. 'Even the dictates of a philanthropic heart would urge youth to be economic. I shudder to think of what the consequences might have been to me if you had been unable to come to my rescue; if the natural affection of the youthful appetite for hardbake, ginger-beer, and lollipops had overcome your economic instincts. Remember, William, that a strict economy once enabled you to be of marked and striking service to a fellow-citizen, who is, unhappily, long past his prime, but w.h. believe me, William, is not ungrateful.'

FRENCH ENTERPRISE IN THE SAHARA.

DURING the last thirty years, a remarkable change has been taking place in the appearance of that part of the Sahara which is contiguous to the French possessions in North Africa. Much of what formerly was desolate and barren desert has now assumed a flourishing aspect; and places which not long since were, owing to their dried-up, lifeless state, quite unfit for vegetable or human sustenance, are now green with verdure and the abode of teeming populations. No longer, so far at least as these regions of it are concerned,

is the common notion of the Sahara as a bare and sterile country a correct one; and probably in the future we shall hear no more of those ruthless projects which aim at turning into an inland sea a country which can with care and enterprise be made so fertile. The experiments hitherto carried out by the French have been entirely successful, and the work of the energetic pioneers of this movement is now being richly rewarded.

The fact of the matter is that the Sahara is not so dried up as is popularly imagined. Although the general surface of the country is, owing to the dry climate and the sandy and rocky nature of the topmost strata, in its usual condition unsuitable for vegetation, yet there is apparently all over the Sahara abundance of subterranean or artesian water. The natural oases which are to be found here and there, are due to this water finding an outlet for itself through the softer soil or gravel laid bare by the deeper chasins or valleys which intersect the surface of the *hamada*, or rocky plateaux, which are characteristic of the region as a whole. While, therefore, the chalk or limestone and sand which compose the upper surface of these *hamada* are almost bare and without vegetation of any kind, yet, when one descends into the chasins or valleys just referred to, places are to be found with plants of various kinds and capable of being utilised for purposes of cultivation. If, too, we except the steppes, the meagre pasturage of which gives life to the wandering nomadic tribes and their herds, these valleys or oases are the only parts of the Sahara inhabited by man. They form, as it were, green islands of life in the midst of a vast lonely ocean.

What the French then are doing is to utilise their knowledge of the geology of the country, and, by boring, to make outlets for the subterranean water, which is plentiful, and so form artificial oases wherever the nature of the country permits. The chief scene of their enterprise has been an extensive low-lying district of the Algerian Sahara known as the Oued Rir. The word Oued, or Ouâd (Wady), it may here be remarked, means originally a watercourse, whether actually containing water or dried up, but from this has been applied indiscriminately to all valleys or crevasses in the Sahara. This Oued Rir, then, is one of the largest and most important of these valleys, and extends from north to south for a distance of about one hundred and twenty miles. At the time of the French conquest of this district in 1854, its resources were in a very poor condition, and it was rapidly sinking in importance. What were once oases had been allowed through want of attention to become desert; the population of the place was diminishing; and the palm-trees, upon the fruit of which they chiefly subsisted, were dying from neglect: the causes of all this being clearly traceable to the intestinal feuds which were constantly taking place among the native tribes.

Since 1854, however, a great change has in these respects been wrought. The centralisation of government brought about by the French administration has completely pacified the country, and the energies of traders have been directed to developing its resources. Many new natural wells

have been formed, and fresh oases have grown up in consequence; the population of the whole district has been doubled, and altogether a movement is in progress the ultimate importance of which cannot be foretold.

The first French well was formed in June 1856, and gave a flow of about nine hundred gallons per minute. As the inauguration of the new civilisation, it was called the 'Fountain of Peace;' and justly so, for surely nothing can be more likely to further the arts of peace than fresh impulses to the cultivation of the soil. Since that date, the work so auspiciously begun has been continued steadily and without interruption; and with such success, that on the 1st October 1885, there were in the Oued Rir alone no fewer than one hundred and fourteen French springs, and four hundred and ninety-two natural springs, yielding in all about fifty-six thousand gallons per minute. Moreover, a fact which was specially gratifying to the workers, was, that even the oldest wells were giving up their watery treasures in as large a quantity as when first they were formed. Naturally, so large a flow of water has resulted in the creation of large tracts of utilisable soil, and the oases so formed have been planted with young fresh palm-trees, while the older oases have been also carefully tended and cultivated. At the present time the Oued Rir contains more than forty oases with as many as five hundred and twenty thousand palm-trees of a full fruit-bearing age, more than one hundred and forty thousand trees of less than seven years of age, and about one hundred thousand other fruit-trees. The annual production of dates amounts to more than one hundred thousand pounds sterling.

The tree for the cultivation of which these oases are so suitable is the Date-palm. Nowhere else does this tree grow so well and so luxuriantly. Its natural wants seem to be exactly satisfied by the physical conditions of the Sahara. What it seems to require is a moist ground combined with a dry climate; and these two contrary states are just what the Sahara furnishes. That the outlay incurred by the planters is soon repaid may be seen from the Report of the 'Société de Batna et du Sud Algerien,' a Society which was founded in 1881 by M. Rolland and the Marquis de Courcival, with the express aim of developing the resources of the Oued Rir. This Society is there stated to have within the first five years of its existence formed three oases and three villages; to have sunk seven spring-wells, giving in all over 4600 gallons of water per minute; to have reclaimed one thousand acres of waste land; planted more than fifty thousand date-palms; dug ditches for purposes of irrigation to the combined length of twenty-five miles; and built houses for the cultivators and the Company's agents, with the result that already a revenue of, in round numbers, twenty thousand pounds sterling has been reaped. The total production of dates in the Oued Rir may be set down at from one hundred to one hundred and twenty thousand pounds sterling per annum, and is constantly increasing. This fruit always commands a sale, for, independently of the quantities which are exported to European markets, it is the regular food of the natives of North Africa, being used by them as wheat is by Europeans or rice by Indians.

But the date-palm is not the only product of these regions, a large trade being also done in ostrich feathers. These last are not so plentiful as they might have been, had the French not, when they first came into these regions, indiscriminately destroyed the birds; but nevertheless the production is very considerable. The total annual product derived at present from all the French possessions in North Africa is worth about eight hundred and forty thousand pounds sterling; and no doubt this sum could be largely increased if ostrich-farming were also encouraged in those districts of the Sahara which are reclaimed in the manner above described.

Further, excellent means for the transport of the products of these oases in the interior already exist, and other reforms are in contemplation which will still further assist the cultivators. From Philippeville, on the coast, a railway runs by way of the important city of Constantine southwards to Biskra. This last place is only sixty-two miles north of the first of the oases of the Oued Rir, but a continuation of the railway is in contemplation which will unite Tougourt, the capital of the district, and the seat of the administrative government, with the coast. This line will pass through all the different oases which have been created, and when complete, will form a ready outlet for the products and commerce of the southern regions. In consequence of all this energy, the desert districts of Algeria seem bound to prosper; and if only the experiment thus tried is imitated in other parts of the Sahara, it would not be out of place to prophesy a great future for those extensive wastes which are at present lying useless in the heart of North Africa.

ASTBURY'S BARGAIN.

A STORY IN SIX CHAPTERS.

CHAPTER IV.—A PARAGON OF MANHOOD.

It was late when Dacon arrived at Cedar Cottage, so late that even Hetty had begun to despair of his coming. Her mother had delayed dinner for an hour on his account, and was not pleased by the inevitable consequence that the extra delicacies provided to tempt the jaded appetite of her future son-in-law were spoiled. After dinner, as was her custom when they were quite alone, she took what was euphemistically termed 'forty winks' in her easy-chair; as each wink occupied rather more than a minute and a half, she had usually a good hour's nap. She awakened under the pleasing delusion that she had only shut her eyes for about ten minutes, and was invigorated by the repose. She was as eager as ever to learn the details of what had happened in the City, and confident that 'Dear Henry would never think of leaving them in suspense for a whole night.' But as the hands of the clock pointed to eleven, she became decidedly impatient; and again when a vehicle stopped at the gate and the sound of footsteps on the gravel was heard, she immediately took credit to herself for never having had a moment's doubt of 'Dear Henry's' consideration for the anxious state of their minds.

'There! I told you he would come, my dears,' she said, as if Hetty and Daisy had been doing

their utmost to persuade her that he would not; 'and sure enough, here he is!'

Hetty ran to meet him, and was startled to see how weary and almost haggard he looked.

'I was sure you would expect me some time to-night,' he said; 'and late as it is, I have come as soon as it was possible. We have had a bad time in the City, as you can guess.'

'You seem to be quite worn out, poor dear,' exclaimed Mrs Silvertown, sympathetically adding in a practical way: 'Take a glass of wine; or will you have a little brandy?—and have you dined?'

'A little of this, thank you,' he replied, helping himself to brandy-and-water; 'but I cannot eat. This has been the most horrible day I have ever known. The loss to the firm is very serious.'

'And is it true that Gilbert Astbury has run away?' asked the widow with a severity of tone indicative of her resolution to have no pity for the young man who had so disgraced her sponsorship.

'He cannot be found,' was the evasive answer.

Daisy had been sitting in the shadow of a large screen, knitting; but she had been observing all that passed and paying attentive heed to every word. She looked up now and spoke in her soft clear voice: 'Do you believe he has anything to do with these frauds?'

Dacon was startled by this abrupt question from the hitherto unnoticed listener. 'I cannot say what he may have had to do with them, Miss Forester.'

Daisy rose and looked at him steadily as she put the next question: 'I want you to tell me, Mr Dacon—do you believe that he is guilty?'

'I do not.' The emphatic answer seemed to jump out of his mouth involuntarily: there was not the faintest note of doubt or hesitation in its deliverance; and yet there was a momentary disturbed expression in his eyes, as if he had heard the words spoken by some one else.

'I should be so glad if he could clear himself of all blame,' remarked Hetty with a sigh.

'Impossible, or he would not have run away,' insisted the widow, holding to her first judgment.

'Thank you, Mr Dacon,' observed Daisy earnestly. 'I also feel sure of his innocence, and sure that it will some day be placed beyond a doubt.'

'I am pleased that you should share my opinion, Miss Forester,' said Dacon, quite recovered from that flash of confusion which Daisy alone had observed. 'I am so satisfied on the subject, that I mean to do all in my power to help him.'

Mrs Silvertown was breathless with astonishment, and relented having so hastily declared her decision. She put on her glasses and gazed at him with unbounded admiration. 'How good!—how noble of you, Henry!' she ejaculated. 'I cannot find words sufficiently strong to express my wonder and delight at such magnanimity! You, who, on account of your friendship for the young man, must, like poor me, bear some reflections for his misdeeds—you are the first to speak in his behalf! This is truly noble, and I wish I could think of him in such a Christian spirit.'

But I am only a woman, and cannot so quickly overcome the—irritation—the annoyance I feel after having presented him to all our friends.'

Hetty's hand stole softly into his, and the gentle pressure of her fingers told him more eloquently than her mother's grandiose address what a paragon of manhood he appeared in her eyes. His hand gave a slight convulsive jerk as she touched it; but this was no doubt attributable to his dislike of such open praise—although she thought the praise was not in the least bit exaggerated.

'I am only doing what I believe to be my duty to a true friend. Unfortunately, there is not much in my power to do; for Mr Ardwick, our solicitor, has already made up his mind about the case, and his opinion is not favourable to Astbury. I made out, too, that his view was taken by the detective who was present at the consultation to-day, although he did not express it so plainly.'

'The detective!' All colour faded from Daisy's cheeks as she repeated the ominous word.

'Yes; I am sorry to say,' Dacon proceeded deprecatingly, as if apologising for himself, 'the affair has passed into the hands of the police. My uncle would have put off that step for another day at any rate, but Ardwick insisted that too much time had been already allowed to slip by before decisive measures were taken.'

'And what will they do?' asked the girl in a frightened whisper.

'They must first find our friend, and then everything will depend on the evidence they can bring against him. As he had not been seen in the office since the forenoon, his lodgings were searched; but nothing that could incriminate him was discovered. His landlady stated that he had gone out in the morning as usual, and she had seen no signs of preparation for a journey. She expected him back at his usual hour; but he has not yet returned to the house.'

'He was here to-day,' said Daisy, looking at her cousin, 'and told me that he was going away, and would probably never return.'

Hetty's cheeks were tingling with the remembrance of the painful scene she had passed through. She had no thought of concealing the interview with Gilbert, although she had announced her resolution not to see him again until this dreadful business was disposed of one way or another. But she could not and would not tell her lover what wicked things Gilbert had insinuated against him, and how fiercely she had been compelled to defend him. The recollection of these insinuations reflected the more lustre on Dacon's conduct towards his would-be traducer.

'Yes,' she said, looking down, 'he told me, too, that he was going away.'

'I am glad you saw him,' was Dacon's ready comment; 'and I hope you contrived to say something cheering to him, for he has been in very low water lately. Since he has told you that he was going, he must have meant it; and I hope he will get clear away beyond the reach of the Scotland Yard people.'

Daisy regarded him with an expression of surprise, and spoke somewhat reproachfully: 'I thought you said that you believed him innocent! If you meant it, you should wish him to be here to prove his innocence.'

'It is very difficult to know what one should wish under the circumstances,' rejoined Daisy uncomfortably, for he was taken aback by her keen glance and sharp rebuke. 'But we will see what to-morrow brings forth. I will let you know everything that goes on; and now I must say good-night.'

'You won't forget that I shall be dying for the earliest intelligence of anything that may happen,' said Mrs Silvertown impressively as she was shaking hands with him; 'for, you know, everybody will come to me for information. I feel almost as if they would regard me as a sort of accomplice—it is so unfortunate that our names should be associated with—with such a'—she was going to say 'criminal,' but substituted the milder but in some intonations scarcely less offensive word—'person.'

Daisy fancied that he winced under the reiterated expression of her aunt's indignation with the supposed malefactor; but he spoke composedly enough.

'Do not disturb yourself at all on that score, Mrs Silvertown. Everybody will be sorry that you were unlucky enough to be acquainted with a man suspected of a blunder like this—for it is more of a blunder than a crime. But nobody whose opinion is worth a straw will dream of blaming you for the kindness you have shown him.'

'(It is curious how he contradicts himself,' reflected Daisy. 'He says he believes Gilbert innocent, and now he speaks as if he thought him guilty.')

'I am glad you should think so,' rejoined the widow; 'but you are so generous and considerate in your way of looking at things, that you are incapable of guessing what ordinary people will say and what scandals they can make out of nothing.' This was said with a smile and an admiring shake of the head.

'I am glad you saw poor Astbury to-day, Hetty,' he said when they were alone together in the little hall and his arm was round her waist.

'He pleaded so earnestly to see me that I was forced to yield,' she answered meekly, but quite determined not to explain that it was the threat of danger to him which had overcome her resolution.

'You did quite right. I should have been more sorry than you can imagine if you had remained stubborn in your determination not to speak to him. Poor chap, he is in a bad fix. I did not like to tell you the worst before your mother and cousin. But every railway station is being watched; telegrams were sent late to-night to the police at every port in the kingdom to have him looked for and his movements watched. To-morrow morning, a warrant will be issued for his apprehension.'

'Should he be caught—what will happen? O Henry, I feel so sorry for him, because——' She hesitated; and a jealous pang shot through the man's breast, extinguishing his better feelings.

'Because what?' he asked with a gentleness the display of which required an effort.

'I do not know that I should tell you; but there should not and need not be any secrets between us.'

'Certainly not.'

'Then it is because I think—no, I am sure—

that Daisy is as fond of him as—as I am of you.'

He drew breath, and experienced a twinge of pain at the meanness of his momentary suspicion that he was her accepted suitor only because he was the heir of John Ellicott, whilst Gilbert was the man she really loved. He was glad, relieved, yet tortured by the consciousness of his own falsehood; but he was palliating it with good resolutions to fulfil the terms of Gilbert's bargain in the fullest measure. He would make Hetty's whole life one of unmixed joy so far as devotion and money could obtain that result. His voice was a little husky when, after a pause, he spoke.

'That is another reason why I must do everything I can to shield Astbury. At the same time it is a pity, for I see no chance of his coming back except as a prisoner.'

'Oh, that would be horrible, and Daisy would suffer as much as I would in her place.' She clung to him fondly whilst speaking; and he felt that she was shivering at the bare idea of him being in such a position. 'Do you think there is no hope of Gilbert being able to prove his innocence?'

The question stung him, and he answered with a curious note of pain in his voice, although the sound was scarcely above a whisper: 'I do not know. Men have been before now in as bad a fix as he is, and have come out of it all right, or at anyrate not much the worse for getting scorched in the fire. I mean to stand by him whatever turns up, and you can tell Daisy to be certain of that.'

This assurance was comforting to Hetty, and would have increased her love for him if there had been any space for its increase. On returning to the dining-room she was flushed, and there was a happy light on her face. 'We need have no fear about Gilbert,' she said, speaking directly to Daisy, 'for Henry says he will protect him, no matter what happens.'

'I am sure he will, and I have just been saying so to Daisy,' observed Mrs Silvertown, who had been busy all the time extolling Dacon's virtues with the biggest adjectives she could think of.

Hetty was surprised that Daisy was not so enthusiastic as herself in expressions of gratitude, when she repeated Dacon's assurance of fidelity to his friend. More, she considered her reception of it ungraciously cold.

Daisy was certainly grateful for his emphatic declaration of faith in Gilbert, and yet she was puzzled by various eccentricities of tone and look. They had, somehow, suggested that the paragon of manhood was, to use an expressive vulgarity, 'shuffling' with an uneasy conscience. So, whilst the others were loud—and she could not deny, justly loud—in their laudations of the devoted friend, she was somewhat silent, wondering what it could be that made her suspicious not only of his generosity but of his truth.

She racked her brain all the night for some explanation of her doubt that should be natural and consistent with the characters and position of the two men. She was glad when morning came, and it was practicable to leave her room and go out without exciting too much astonishment in the minds of the domestics. She took a brisk walk in the keen morning air, through the meadows round by the Herne Hill road, with the fresh

foliage of its ancient trees sparkling with many delicate shades of green in the sunlight. Then down the steep brow of Champion Hill, through the meadows again back to the Cottage.

A telegram from Dacon arrived at luncheon-time: 'Nothing known yet, except that he has got away.' Later came a messenger with a note for Hetty. She was disappointed and distressed, but not alarmed by its contents. This was what she read to her mother and cousin: 'It will be impossible for me to call this evening. My uncle has had a serious attack of apoplexy—so serious that the doctor fears the worst, and I must remain by his side.'—(The lamentations of the lover for the joy he had to forego were judiciously omitted by the reader.)—'No trace of Astbury has been discovered; but it is painful to me to write that the bank officials are able to prove that he received the cash for most of the forged bills. The cashier who paid the money knew him well, and there can be no question as to his identity. I am truly sorry for this; but still hope that there may be some mistake, although everything is against the probability of it.'

A heavy cloud shadowed Daisy's face as she listened to these last sentences. Mrs Silvertown scarcely heard them, for at the announcement of the dangerous illness of Mr Ellicott, her interest in Gilbert's fate was for the time extinguished by the more important consideration of the change which the uncle's death would make in 'Dear Henry's' circumstances. He would come into a vast fortune immediately; and—of course after a decent interval—she would see her daughter united to the chief of the great firm of Ellicott & Co.! But whilst thus cogitating, she was not unmindful of the conventional expressions of regret for the old gentleman's affliction and imminent danger.

'It is very dreadful, my dears, to think of the poor old man being so suddenly stricken. The last time I saw him he looked as if he would long outlive my time. Still, we must not forget that in the course of nature we have all to be prepared for the end; and Mr Ellicott has passed the allotted span.' She breathed a sweet sigh of resignation, leaned back in her comfortable chair, and devoted herself to pleasing speculation as to how many thousands a year her future son-in-law would inherit.

'Ah, here is something written inside the envelope,' ejaculated Hetty, as she stopped in the act of replacing the letter. 'He says: "I have just learned that Astbury was seen at Charing Cross railway station last night taking a ticket for Marseilles. A detective has followed!"—O Daisy, I hope he will escape!' The expression was full of deepest pity for her afflicted cousin.

Daisy got up, looking very cold and bewildered as she moved towards the door. She stopped on the threshold, and turning her face to Hetty, said strangely: 'I hope he will not escape; I hope they will overtake him and bring him back.—There; do not mind what I say; I am out of sorts.'

Hetty did not follow, for she understood her sorrow, and knew that solitude would be most welcome at present. But she was utterly at a loss to guess why Daisy should wish Gilbert

to be captured by the police. She would have done all that a woman could do to hide the man she loved and shield him from such a fate. She did not divine how thoroughly convinced Daisy was of his perfect innocence; and how completely she was imbued with the idea that his only crime was in failing to come forward to assert it.

The next day, Daisy had recovered her habitually quiet demeanour. She was a little paler than usual, but, as she rarely had much colour in her cheeks, the fact did not attract attention. She had not confided her sorrow to Hetty, who had half expected she would, and was prepared to give her every help and comfort that sincere sympathy and affection could give.

The forenoon post brought the news for which they had been prepared by Dacon's letter. Mr Ellicott had died without once recovering consciousness or the power of speech. As the deceased gentleman had not been an intimate friend of the inhabitants of Cedar Cottage—although Mrs Silvertown did her best to make him out to be so on the strength of his one visit, when he simply sent in his card by the footman—the ladies were only affected by his loss in so far as it concerned Henry Dacon.

The widow was delighted to learn in the course of a few days that Dacon was, as she had anticipated, left at the head of the house in Fenchurch Street; and although she was chagrined at the large amount of money of which he was deprived by the legacies to various relatives and charitable institutions, she was quite satisfied that the future life of her daughter was to be one of ease and splendour, as far as money could purchase these desirable conditions of existence.

In the City there was a profound feeling of astonishment and regret; for John Ellicott had been regarded as one of the most prominent of citizens and business men: a steady supporter of all City rights and privileges, and a true philanthropist, giving help freely wherever help was really needed. Moreover, it was very plainly said that his death was in some mysterious way associated with the discovery of those enormous frauds on his house. He had been seen on 'Change, and had transacted business requiring the clearest intellect on the forenoon of the day of his fatal attack.

Even the deepest impressions, however, are speedily centred by the whirl of City life; and so, as when the king dies, the cry of 'Long live the king!' is immediately heard, Henry Dacon found himself recognised as the chief of one of the wealthiest firms within the sound of Bow Bells. He bore his honours modestly, and thereby enhanced the golden opinions he had already won from City magnates whilst he had held a subordinate position. The great fraud on his house was soon shelved for more recent wonders of the same character. It dropped into the category of those varying commercial legends discussed by junior clerks at luncheon bars in and about Cheapside.

In this case the legend was, that the confidential clerk had got clear away with his booty in spite of all the efforts of the police; and the amount of his plunder was estimated according

to the imagination of the individual at from eighty thousand to two hundred thousand. A action was brought against the bank to recover; but it was compromised without going into court, and the firm bore the loss, which was stated to be very much smaller than had been at first supposed. Mr Ardwick the lawyer declared that such a result would never have happened if Mr Ellicott had been alive. He attributed the failure of the case entirely to the half-hearted spirit in which the new chief of the house went into the proceedings, whilst he cleared out of them in direct opposition to the best legal advice. Henry Dacon was, however, content to let the affair drop, and was glad when it was disposed of, although he was so much the poorer by the arrangement. He was still a rich man; his wedding day was approaching, and it was natural that he should wish to be relieved from the suspense inevitably entailed by an undecided lawsuit, however certain the result may appear to be. 'Thank Heaven, it is all settled, Hetty,' he said, on the evening of the day on which the compromise was agreed to. 'We can start clear of worries, and know what we are about. Ardwick is wild with me for not going on; but I have had enough of it, and am easy in my mind so long as you say it is all right.'

And of course Hetty said it was all right, expressing at the same time her happiness in the feeling that on their marriage day he would not be harassed by the phantoms of law's delay, costs, and losses. She was quite sure that the lawyers only wanted to carry on the case for their own benefit.

There was, however, one person in Cedar Cottage who agreed with Mr Ardwick. That was Daisy; and for weeks she had been seeking an opportunity to speak to Dacon alone. He was instinctively aware of her desire, and contrived to avoid a tête-à-tête by one excuse and another. On the very eve of the wedding day, Daisy found her opportunity. Mrs Silvertown was busy in the drawing-room arranging and rearranging the marriage presents; and on an imperative summons from her mother to settle something about the disposition of the gifts, Hetty left her lover and cousin in the dining-room. As soon as the door closed, Daisy spoke hurriedly but resolutely: 'I am glad of this opportunity, Mr Dacon, to ask you where is Gilbert Astbury?'

'Astbury!—Well, really'—

She lifted her hand impatiently, to signify that he was not to proceed if he intended to repudiate his knowledge of the fugitive's whereabouts.

'You do know where he is,' she continued, 'and I want his address. It is now more than a year since he went away; and if you have not known it all along, you have known for some time where he might be found.—Please, do not waste time in denying it, for I wish to spare Hetty any unpleasant recollections, and she will return presently. I believe you have been acting as his friend, although acting under a mistaken idea as to what was the course a true friend should take. I mean to set him right before the world, and you must help me.'

She had made a bold hazard of a guess at the truth, and she had struck the mark. In the

meanwhile he had recovered from the first surprise at the vehemence of her attack, and answered quietly, even with the equanimity of one conscious of having done a good turn to his neighbour: 'Have you forgotten, Miss Forester, that I promised to do all in my power to serve him? I have kept my word; and you are right—I do know where he is.'

'Where?'

'In South America, where he is safe, prosperous, and, I believe, as happy as a man can be under the circumstances. At anyrate, he has made up his mind not to return to England.'

'Is he aware of all that has been going on here? Is he aware that he bears the brand of crime, although he has not been convicted except by his own folly in leaving the country?'

'Being conscious of his innocence, I suppose he is indifferent to all that. He says nothing about it in his letter to me.'

'Ah! he has written to you?'

'Yes, and forgets none of his friends in asking for news of home.'

He put a delicate emphasis on the word 'none,' to imply that hers had been prominent amongst the names mentioned.

'Does he know what is to take place to-morrow?' She put the question under the influence of a degree of anxiety which seemed to be stifling her.

'You mean our marriage?—Oh yes, and he sends us his kindest wishes for our future happiness.'

'Will you give me his address?'

He hesitated, and then said thoughtfully: 'If you will consider for a moment, you will agree with me that I must first ask his permission.'

She bowed her head in acquiescence, and the conversation was stopped by the return of Hetty.

SOME NICE POINTS OF CRIMINAL LAW.

BY A MAGISTRATE'S CLERK.

WE often ask ourselves why should not our laws be couched in plain language, devoid of all technicalities, so that 'he who runs may read,' and he who reads may understand? So far as this can be done, it is doubtless the duty of those who frame our laws to see to it; but it is too often forgotten that facts and circumstances connected with the commission of crime vary to so great an extent that it is almost impossible to word our laws in such a clear and intelligible way as to cover that varied state of things. Let us give a few illustrations of this.

We all know what is meant by the crime of burglary. It is defined in our law-books to be the 'breaking and entering of the dwelling-house of another in the night with intent to commit a felony therein.' Surely nothing can be plainer. The only word that appears to require defining is the word 'night'; and a statute passed in 1861 (24 and 25 Vict. chap. 96, section 1) has clearly defined that word by enacting that the 'night' shall be deemed to commence at nine p.m., and conclude at six a.m. of the next day. One would naturally infer, therefore, that there can be no difficulty in deciding when a person is guilty of the crime of burglary. But let us see. In the

first place, has the difficulty in connection with this very word 'night' been removed by the statute? Suppose a man, at five o'clock in the morning, breaks the skylight window of a dwelling-house, but in consequence of being disturbed, does not enter the house till a quarter past six, can he be said to have broken and entered in the 'night'? We must remember that the judges of our criminal courts interpret, and of course must interpret, the law literally as they find it. In the case supposed, therefore, though the house was broken into at a time which comes within the legal definition of the word 'night,' still it was not entered during the night as defined by the Act; and as both a breaking and an entering are necessary to constitute a burglary, that crime was not committed in this case. If, however, the burglar who was disturbed at five A.M. escapes, and at five A.M., or at any time before six A.M. *next day*, avails himself of the hole he had previously made, and enters the house with a felonious intent, he has committed burglary, for the simple reason, that the breaking and entering were in the night-time, though not the same night.

It now being made clear what is meant by the word 'night,' it may well be supposed that no further difficulty will be in our way of deciding what constitutes the crime of burglary. But not so fast. Are you clear what is meant by the word 'dwelling-house'? (I may mention that the Act of Parliament already referred to makes it burglary to break into any building connected with a dwelling-house, if such building be within the same curtilage, and immediately communicating with it, or by an enclosed or covered passage, leads to it.) I can imagine the reader exclaiming: 'What useless refining! Does not every one know that a dwelling-house is a house that a person dwells in?' Very true. But suppose Paterfamilias has decided to give his family a treat, and has locked up his house and drawn the blinds and gone to the sea-side for three months; and suppose the nocturnal and unwelcome visitant, on mischief bent, profiting by his knowledge of that fact, breaks into the house at the midnight hour and carries away his plate—has a dwelling-house been broken into? No one dwells in the house, nor has been for some weeks. Our learned lawyers have answered the question for us in the affirmative, and have decided that so long as Paterfamilias had not *permanently* vacated his house, but intended to return, it is no less his dwelling-house, though for the time being he may be snugly ensconced, or perhaps suffering martyrdom, in a small cottage by the sea some hundreds of miles away.

Let us, however, suppose that he has quitted his house, intending to go and live permanently in another house; that he has not taken all his valuables out of the house he is leaving; and let us suppose those valuables to be stolen by a midnight depredator breaking into that house; do our learned expounders of the law tell us that the crime of burglary is committed in this case? No. On the contrary the house is held *not* to be a dwelling-house, for the reason that the occupant has left it without any intention of returning to dwell in it. The writer remembers a case in point being tried in court. A woman was removing from one house to another, and was carrying her furniture up to eleven o'clock

at night; but becoming tired, she determined to lock the house up and go to rest for the night in the house she was removing to. Before she had gone to rest, however, she was told that a thief had broken into the house she was leaving, and carried away some of the furniture she was too tired to remove. This was held not to be burglary, inasmuch as the thief had not broken into a 'dwelling-house,' the woman having left it without any intention of dwelling in it in future. (Of course, the offence of larceny was committed.)

But suppose a man has two houses, a country and a town house; and he occupies the one in summer and the other in winter; and one house is broken into in the night and his goods stolen from it, whilst he is residing in the other house—can this house be considered the man's dwelling-house, seeing that for the time he does not dwell in it? Yes, say our lawyers; both are dwelling-houses within the meaning of the law. He does not, when dwelling in one, permanently leave the other. The reader will see by these examples how difficult it may become sometimes to define even the simple word dwelling-house.

Now, suppose I erect a tent or booth at a fair, and dwell and sleep there nightly, and a thief breaks in during the night and commits larceny, is he guilty of burglary? Our law-expounders say No. But why? Well, the tenement cannot be considered a dwelling-house: 'so frail a tenement,' it is said, 'is no more deserving of the name of a house than a covered wagon would be under the same circumstances.' And yet it has been decided that a mud and brick house, rented during a fair only, is a dwelling-house for burglarious purposes. Such are some of the nice refinements of law in connection with the word dwelling-house.

We have said that to constitute the crime of burglary there must be a 'breaking and entering.' Now, it may well be supposed that no circumstances can arise so as to create any difficulty in deciding what is meant by breaking into and entering a house. But it will soon be found by any one who sits in a criminal court constantly, that cases arise that make it extremely difficult to decide whether the circumstances constitute a breaking and entering. Let us take the word 'breaking' to begin with. If a man leaves a large hole in his roof, or if he leave his window open at night, any entry through that hole or window is not a 'breaking' in law. There may be an entry into the house, and valuable property may be stolen, but the house is not 'broken' into, and therefore no burglary, whatever other crime, has been committed. The reader might therefore naturally conclude that if a sweep quietly came down a chimney into a house in the night with intent to steal, he would escape the charge of burglary, as he had not 'broken' into the house. The reader, however, is not 'learned in the law.' If he were, he would no doubt agree with Justice Bosanquet, who has decided that to enter a house by the chimney is on a different footing from entering it through any other hole or an open window. A chimney, it is said, is a necessary opening in every house, and needs the protection of the law; but if a man leaves an opening in the wall or roof of his house, instead of a fastened

window, he must take the consequences—that is, the thief will not be guilty of the crime of burglary. This is a very fine distinction, it must be admitted.

But suppose a window be not left open wide enough to admit a person, and that the nocturnal visitant lifts it up and enters, would he have 'broken' into the house? No, say our learned lawyers. And yet, if he puts his arm through a broken pane of glass and accidentally makes the hole larger, and so reaches and undoes the catch; or if he simply lifts up a latch or lifts up a window which is down, he has 'broken' into the house.

Lawyers also talk of a 'constructive breaking.' If a man knocks at the door of a house, and on its being opened, rushes in, at night, to steal, he is guilty of burglary; or if he gets in on a pretence of taking lodgings and falls upon the landlord and robs him; or if a servant conspire with a burglar and lets him into the house, both are held to have 'broken' into the house, and therefore, under the circumstances named, to be guilty of burglary, as the entry is obtained by fraud. But what would the reader unlearned in the law say if he were asked whether there was a breaking into a house in a case like the following, a case which really did happen, and which is reported in the law-books? A groom meets a man named Jones, who proposes to him to rob his master of his plate. They agree to meet on a future day; but the groom in the meantime communicates with the police, and the master being out of town, the groom acts under the direction of these officials. He meets Jones and his companion Johnson, and the robbery is presumably concocted between them. The groom is to get the other servants out of the way on a particular evening, is to admit a number of police, and then to admit Johnson into the house. He accordingly opens the kitchen door and does so; and whilst Johnson is up-stairs, about to commit his deed of depredation, the police pounce upon him and lock him up in a room. The groom then admits Jones, who takes the plate basket from the kitchen. Surely there is here a case of constructive breaking and entering with intent to commit felony, and therefore a clear case of burglary. Now, let us see how our learned men of the law look on such a case. We know that the groom, though appearing to act in concert with the prisoners, did not really do so; in fact, acting under the directions of the police, he may be looked upon as acting on behalf of his master. The door was therefore lawfully open, and there was no felonious 'breaking.' The only offence remaining, therefore, was the stealing of the plate by Jones. And here another nice point arose: was Johnson also guilty of stealing the plate with Jones? No; it was held he could not be, because at the time Jones steals the plate Johnson is in legal custody, and therefore could not be guilty of the offence. He was, however, convicted of being an 'accessory before the fact.' The curious point, however, is, that neither of them was held to be guilty of breaking into the house; nor even of 'constructive breaking.'

Let us take another case to illustrate the point of 'breaking.' A boy is left in charge of a house by his mother. Like many other boys in similar circumstances, he runs out a few minutes after 9 P.M. with the key in his hand, to suit a pur-

pose of his own. A female neighbour meets him, and says to him that his mother has returned and has sent her to him for the key, but that he can go on his errand. Believing her statement, he gives her the key, and she opens the door and enters the house and steals. Has she feloniously 'broken' into the house? Certainly. Why? She obtains the means of entering by fraud, and therefore is as much guilty of breaking as if she had done so by means of a false key.

So much for some of the nice points as to what constitutes simply breaking into a house.

THE STORY OF QUEX.

In the isle of Thanet and the near vicinage of that favourite seaside resort of Londoners, Margate, is a residence bearing the somewhat un-euphonious name of Quex. This house is a modern building, and though not occupying precisely the same site, is the successor of an older mansion which was not wanting in historical associations, besides being noteworthy as the scene of the remarkable occurrence about to be narrated. From a view taken in 1781, the old house of Quex—or Quekes as it was sometimes spelled—appears to have been an extensive brick building in the ornate Elizabethan style, with decorative gables, but having large bay windows of stone. Yet even at that time it had fallen into an almost ruinous condition. Some of the dilapidated rooms had already been pulled down; others followed from time to time; and early in the present century the whole of what remained was, with the exception of some unimportant fragments, demolished. A cellar and portions of a garden wall are alone left of it, though panelling and some other relics were removed to the new house.

Such was its fate. Yet, in addition to that story with which we have chiefly to do, an interest attached to the old house at Quex as having been an occasional place of sojourn of King William III. If, when that sovereign was about to pay one of his numerous visits to his native country, he was detained by contrary winds, it was here that he was accustomed to take up his abode. The king's bedchamber was long pointed out. His guards encamped in the enclosures round the house.

This place was in ancient times the seat of a family who derived their name from it; but in the fifteenth century (about 1485) an heir-female of the Quekes brought the manor to a family previously seated at Stanlake, in Oxfordshire—the Crispes. That house became thenceforward of importance in Kent; and a certain Henry Crispe, who died in 1575, acquired so much local influence as to be commonly styled 'king of the isle of Thanet.'

In Commonwealth times another Henry Crispe, a grand-nephew of the king of Thanet, was master of Quex. This gentleman had acquired the nickname of 'Donjour Crispe' from the circumstance that during a residence in France he had learned no more of the French language than

that one word. But if not distinguished as a linguist, his birth and position caused him to be respected among his neighbours. He had served his year as High Sheriff of Kent, and unlike many of his class, he had not been so indiscreet as to impoverish himself by any unnecessary display of loyalty for King Charles. He seems, indeed, so far as there is material on which to form a judgment, to have been one of those prudent politicians who endeavoured to stand well with both parties. At the time in question he was considerably advanced in years and in infirm health, and was leading a life of easy and affluent retirement in his paternal mansion.

But his dignified repose was not destined to continue. A warning was conveyed to Mr Crispe that he was in danger—that he had enemies, whose machinations threatened his safety. The exact nature of the impending peril does not appear to have been hinted, and indeed the whole warning seems to have been of the most vague and unsatisfactory description. Most men, perhaps, would have treated such an anonymous alarm with contempt; but it filled the worthy owner of Quex with uneasiness. He took measures for his own defence. He armed his servants; he caused holes to be made in the walls of his house in such places as he considered desirable for the more effectual use of firearms; and is said to have offered bountiful entertainment to all those of his neighbours who by lodging for a night in Quex might aid in his protection.

But the scare blew by. It seemed as if it had been a mere idle and groundless alarm. Indeed, the times were not now such as to favour any scheme of lawless violence. Oliver had seated himself firmly in the place of supreme power, and maintained order throughout the land with a hand of iron. Mr Crispe allowed his precautions to be relaxed, and life at Quex resumed its ordinary calm.

How or by whom the mysterious warning had been conveyed to Mr Crispe is uncertain. But it was no idle rumour; not was the danger by any means past. His enemies were simply waiting for a convenient season in which to put their plans in practice; for a plot had actually been arranged in which this unfortunate gentleman had been marked out as a victim, and that plot was under the direction of a leader of no ordinary qualities or character.

Among the daring spirits developed by the great civil war there was no loyalist more enthusiastically devoted to the Crown, more fertile in expedient, or of more dashing bravery, than Captain Golding of Ramsgate. Had he been a rider instead of a sailor, he would have been a cavalier after Prince Rupert's own heart. One of his exploits during the Commonwealth had been carrying off a rich merchantman, the *Black-moor Queen*; and after converting both ship and cargo into money, handing over the proceeds to the exiled Prince Charles, to whom at that time, perhaps, a proof of loyalty in no other form could have been so welcome.

Captain Golding it was who was the originator and moving spirit of the plot, and as a Thanet man, the house of Quex and all its surroundings were perfectly familiar to him. He proceeded to carry out his plans in due time. One night in the month of August 1657, Golding with a

number of resolute men, partly English and partly foreigners, landed, unobserved at Gore-end, near Birchington-on-Sea, and marched to Quex. So well did he order matters that he was able to reach it and force an entrance without giving any alarm to the neighbourhood. None of those who had feasted on Mr Crispe's good cheer were there to defend him; not a shot was fired through the loopholes he had made; and his servants, taken by surprise, were too completely overawed and overpowered to offer the least resistance. The unlucky gentleman woke from his slumbers only to find his bed surrounded by armed men. He was ordered to rise, and the horses having been put to his own coach, he was placed within and escorted by his captors to the beach. When he became aware that he was to be carried beyond the seas, he made earnest entreaty to be allowed to take one of his own servants with him; but this was refused, though the state of his health rendered such an indulgence very desirable. He was thrust into an open boat and carried off to Captain Golding's ship, in which he was at once conveyed as a prisoner to the Low Countries.

The abduction of Mr Crispe of Quex is interesting from the fact that it is a solitary case. In modern times it has had no parallel in England. We have no other instance of an English gentleman of position being forcibly carried off from his home in an English county, although in some other countries such affairs have by no means been exceptional.

The unfortunate Mr Crispe was conveyed to Ostend, and thence to Bruges, both of which places were then subject to Spain, a power against which the English Commonwealth was at that time at war. No redress was therefore to be hoped for through the intervention of the Spanish Government, and indeed, as will be seen in the sequel, it was in his own Government that the prisoner found his worst obstacle to the recovery of liberty. However, from his prison-house in Bruges Mr Crispe was allowed to communicate with his friends, and in especial to inform them that a sum of three thousand pounds would be required for his ransom.

Mr Crispe had an only son, Sir Nicholas Crispe; but for some reason—probably owing to the declining health of Sir Nicholas—a nephew who resided not far from Quex, a Mr Thomas Crispe, appears to have been the relative upon whose good offices the captive chiefly relied. This nephew at once set out for the Low Countries. Arrived at Bruges, he found no difficulty in obtaining access to his uncle, to whom indeed, apart from the deprivation of liberty, no ill treatment appears to have been offered; and after due consultation, it was determined to agree to the terms proposed. Thomas Crispe accordingly returned to England to arrange with his cousin, Sir Nicholas, the means of raising the sum required—a far more serious matter in those days than it would be now—and to take whatever steps might be desirable to facilitate the payment of it. But the unhappy Squire was far from the end of his troubles; an unlooked-for difficulty was about to arise.

Various as may be the advantages of standing well with both parties, it has one disadvantage—the trimmer can expect to be trusted by neither side; and so found prudent Mr Crispe. Whilst

the Royalists regarded him as no better than a rebel and a fit subject for spoliation, Cromwell, on the other hand, suspected him of collusion with the king's friends; that he had, in brief, been a consenting party to his own abduction, and that the whole affair had been arranged to afford a colourable pretext for supplying the exiled Charles with English money. All power was now in the Protector's hands, and he caused an Order in Council to be issued in which any ransom whatever was forbidden to be paid for Mr Crispe.

Between Royalists and Cromwellians the poor gentleman was indeed in an evil case. A prisoner he had to remain; and whilst bribes and indirect influence of various kinds were being employed in all promising quarters to obtain a revocation of the vexatious Order, matters were still further complicated by the death of the heir, Sir Nicholas Crispe. The whole burden of his uncle's affairs now fell upon Thomas, who appears to have shown most praiseworthy zeal in their management. Six times in the autumn and winter of 1657-58 did he cross and recross the narrow seas to confer with and to console his afflicted relative.

At last the desired license from government was obtained; but the cost of obtaining it, with other necessary expenses, had so much impoverished the Crispes that it was no longer possible to raise the ransom without selling some part of the estate. To procure from his uncle the necessary legal authority for doing this involved another journey to Bruges on the part of Thomas Crispe. Eventually, by the sale of certain lands and the mortgage of the estate of Stonar in the isle of Thanet, the money was procured and paid over. Whether any part of it found its way into the coffers of Prince Charles is a matter of conjecture merely. It was only after a captivity of eight months that Mr Crispe was allowed to return to his home a free man.

It is recorded that after all his troubles he again lived in peace at Quex for several years. He died at that place on the 25th of July 1663, leaving, it is satisfactory to learn, his estate to that nephew who had so well done a kinsman's part by him.

It is satisfactory also to learn that Captain Golding closed his adventurous but somewhat dubious career with honour. Whilst Cromwell lived, he took good care to keep beyond his reach, and remained in high favour with Prince Charles throughout his exile. At the Restoration in 1660 he returned with his master to England, and, as his share of the good things at that time showered upon his party, received command of the *Diamond* man-of-war. In 1665 he fell bravely in battle whilst fighting his ship against four Dutch frigates.

In the church of Birchington-on-Sea, of which parish the manor of Quex forms a portion, there is a Quex Chapel. It contains monumental brasses and other memorials of the houses of Quekes and Crispe. Noticeable among them is the fine tomb of Henry Crispe. The brasses, six in number, are to the earlier line.

Since the extinction of the male line of the Crispes in 1680, Quex has had many owners. It was once purchased by the first Lord Holland for his famous son, Charles James Fox. But

that nobleman soon found himself obliged to sell it again; hence, among the associations of Quex it is unable to number that of having ever been the residence of the great Whig orator and statesman.

THE TELEPHONE EXCHANGE.

THERE is in the very heart of most of our large towns an excellent subject for the painter's brush, of which, probably, he has never thought. Fancy has drawn him to Venice, and inspired him to paint a row of Venetian beauties stringing beads, or to Seville, where he has been captivated by the charms of the cigarette makers. But probably no one has hinted to him that there is at home here in London, Liverpool, or Manchester an equally good subject of the kind, which would have the merit of entire novelty, and be capable of bright, if not even romantic treatment—we mean a bery of pretty English girls working a Telephone Exchange. Let us imitate Actæon, and take a peep into one of these secret haunts, where the modern Diana and her nymphs are playing at the Fates, and cutting or joining the lines of electric speech between man and man in a great city.

The scene is a long and handsome room or gallery in the Royal Exchange of Manchester. A strange piece of furniture like a long high desk occupies the middle of the gallery from end to end, forming the figure L. This is the switchboard where the wires from the subscribers' offices and homes are centred as in a nervous ganglion or knot; and where they are connected or disconnected in a moment by the telephone girls, to enable any two subscribers to converse together.

The board is of the type known as the 'Multiple Switchboard,' an American invention, by which the work of connection is divided up, and distributed amongst a number of operators. This is done by forming the board into sections, at each of which an operator presides. All the subscribers' lines are brought to every section, so that the operator can cross-connect any two lines in the whole system without leaving her place or asking the help of another operator. Each section of the board is, in fact, an epitome of the whole; but it is physically impossible for one operator to attend to all the calls of a large Exchange, and the work is thus distributed amongst the whole number.

The multiplicity of wires on a switchboard such as this, when the number of subscribers is large, say fifteen hundred, will be readily understood, when it is remembered that each of these fifteen hundred wires goes to every section of the board, and there may be as many as fifteen or twenty sections. The multiple switchboard is indeed a complicated and expensive apparatus; but so far it is the best yet devised; nor is it easy to see how a simpler plan for effecting the same purpose can be invented.

That maze of wires is, however, all concealed at the back of the board, where it is arranged by the electricians of the Telephone Company. The young lady operators have nothing to do with it; so much the better for them. It would puzzle

their minds worse than a ravelled skein of thread or an equation in mathematics. Their business is to sit in front of the board in comfortable desk-chairs at a running table, within reach of their telephones, and watch the 'calls' come in from the subscribers. The call-signal is given silently by the dropping of a disc, and the 'number' tells the operator who the caller is. She responds to the call, speaks to the subscriber by her telephone, hears what he wants—that is to say, the 'telephone number' of the other subscriber he wishes to speak to; and taking in her hands a pair of brass plugs coupled together by a flexible conductor, she joins the two subscribers' wires upon her section of the board. This is simply done by thrusting the two plugs into the two holes of the section corresponding to these wires. The subscribers are then free to talk to each other undisturbed, and the termination of the interview is signalled to the operator.

In the Manchester Exchange the board is divided into about twenty sections, and the same number of operators may be seen at work there, each sitting in her chair along the table of the board with her telephone before her, the Blake transmitter suspended in the air on a level with her mouth; the Bell receiver close to her ear; the terminals of subscribers' wires, and their signal discs rise, tier upon tier, in front of her, like the shelves of a bookcase.

The operators are all as busy as can be; for Manchester is a busy Exchange, especially in the middle of the day. Every instant the call-discs are dropping, the connecting plugs are being thrust into their holes, and the girls are asking: 'Hallo! Hallo!'—'Are you there?'—'Who are you?'—'Have you finished?' But all this constant activity goes on quietly, deftly, we might say elegantly, and in comparative silence; for the low tones of the girls' voices in making the necessary inquiries are in general soft and pleasing; and the harsher sounds of the subscribers' at the other ends of the lines are never heard in the room except by the operators listening in their telephones.

The young ladies who execute this work so skilfully and well belong, as a rule, to a very good class of society; they are mostly daughters of professional men or well-educated members of the middle class. There is consequently a superior tone about them; and the nature of the work is, on the whole, of a dainty and select order. It has its little drawbacks, of course; for example, the inconsiderate subscriber who wants to be 'put through' to his correspondent at once, and cannot understand that his correspondent's line is already engaged by another subscriber. But, on the whole, the system goes well; and the work appears to be adapted to young ladies. It demands tact, quickness, and a certain endurance; for the constant strain on the attention and the everlasting movement is such as children, boys, or young women can support, but men might suffer from. In short, it is lady-like employment, and the operators seem to enjoy it. It gives them an occupation, if it does not promise them a career; and there are cases of girls travelling up from the country every day to attend the Exchange, although their railway fare nearly swallowed up their earnings.

There is always a lady superintendent in the

Exchange, who walks about and oversees. Moreover, there are, at least in London, several higher lady officials, the chief and her deputies, who select the operators and superintend the entire female staff.

In Liverpool, Glasgow, and Edinburgh, the Central Exchanges are worked in much the same way as that of Manchester. In Dundee, a comparatively small Exchange, the subscribers have no telephone numbers, but simply give their names; and strange as it may appear, the operators cross-connect them without making blunders, though this implies their knowing the addresses of all the subscribers and their positions on the board.

The present writer happened to be in the Dundee Central Exchange not long since during a busy period of the day. He had not been in Dundee for many years, and though he had spent a portion of his boyhood there, he had lost all trace of his old comrades. What, then, was his surprise, while standing behind one of the lady operators, to hear her call out the name of a particular old playfellow, whom he believed to be in Manitoba, but who, it seems, had returned to Scotland!

No preliminary training is required of the operator beyond a good education. Her salary, small at first, is gradually increased as she advances in the service. The period of duty varies according to the shift; but nine hours a day is the limit; and the night-work in the Exchanges is comparatively light. With the exception of one or two in London, all the Exchanges are operated by young ladies.

PREFERENCES AND TREASURES.

BY CHARLES MACKAY, LL.D.

I'd rather drink cold water from the brook,
Than quaff excitement from a golden chalice;
I'd rather sleep on straw in shepherd's hut,
Than lie awake and restless in a palace.

I'd rather earn dry bread in lusty health,
And eat it with a sense of wholesome pleasure,
Than feed without the zest of appetite
Off gorgeous plate and unavailing treasure.

I'd rather have one true unfailing friend,
Than fifty parasites to crave my bounty;
And one poor lass who loved me for myself,
Than one without a heart who owned a county.

Nature is kind if our desires are pure,
And strews rich blessings everywhere around us;
While Fortune, if we pant in her pursuit,
Too often grants her favours to confound us.

Fresh air and Sunshine, Flowers, and Health and
Love—
These are endowments if we learn to prize them;
The wise man's treasures better worth than gold,
And none but fools and wicked men despise them.

THE RISING OF THE SAP.

SPRING is in the air, although snow may come again. This morning I heard the first thrush sound his jubilant clarion, although I could not see his dappled form because of a sudden shower of sleety rain which blurred the windows. By noon the rain had vanished, and with it the lingering frost, and now the sky is flecked with soft white clouds, and in the welcome azure the sun shines brightly once more. Why, therefore, should I stay in-doors and limit my thoughts to the four walls of my parlour, when I may have the illimitable air to breathe in, the green woods to walk in, and Nature's sweet society in which to expand my cramped ideas? In these grassy glades of Dunnikier I am certain that at last Nature is awake, and that her hidden processes of development are about to be revealed. I can trace the beginnings of spring in this delightful sense of rushing, dripping, twinkling thaw, which causes the little stream to flow so freely between its red clay banks, and sends it singing on its way with a merry clinking of broken floating ice.

Movement and sound are the heralds of spring's advent: the dumb monotony of the frost-bound months has fled, and every living thing hastens to renew itself and so fulfil the law of its being. Now the sap within the trees is steadily creeping upward; the rough bark feels the inward commotion and responds to its farthest tiniest twig, as the sentient sap strains and trembles towards the magnetic heat and light of the sun; and every unobtrusive bush has a crown of faint suggestive colour, a misty purple, a flush of palest red, or a tinge of warm brown to bear witness that it is alive once more.

How sphinx-like are those stately bare trees! How passive, how apparently unresponsive, they stand, and yet they are the embodiment of Nature's yearly purpose of revival. They symbolise the unconquerable longing for light; inarticulately, they utter that which is a universal prayer, whether heard in the cry of the dying

Goethe, or expressed in the blind striving upwards of sap and leaf and grass, and the eloquent devotion of sunflower and daisy.

In this secluded path, minute forms of vegetation have already pushed themselves above the moist soil; and indeed I did not realise how barren and drear the winter was until to-day, when I detect the various preparations which Nature is making for her spring transformation. Half hidden among bleached dead leaves and russet bracken peep the exquisite and perfumed blossoms of the wild strawberry, their tiny roses as pure as the snow which they have superseded; and daisies, too, are beginning to unfold their pink-tipped fringes. Soon they will shine in thousands, a milky-way of silver stars upon the nether firmament of greenward; soon, too, the many-jointed coltsfoot and the dandelion will strew their liberal coins along the path of the happy children who alone know the true value of Nature's gold.

Already the bristling green spines of the whins are pointed with a radiant hint of the coming carnival of scented golden bloom; and lo! here is the first, the very first, celandine of the year. Truly

Thou hast come with half a call,

Spreading out thy glossy breast

Like a careless prodigal!

With delight I hail the golden star shining amid its dark foliage of heart-shaped green at the foot of the sheltering whins that skirt the gloomy fir plantation: it is the identical spot where I have found the first celandine in this glen for years. For there is a kind of heredity in spring. This little flower, for instance, is but a transient blossom, yet it has sprung from past generations of its race; the enamelled golden star has shone here in springs gone by—long, long before I came to the woods to seek it; and it will shine in future springs to delight other eyes than mine. The laws of Nature are fixed and enduring; but the expression of these laws in plant, in bird, in season, is fugitive and transient; therefore is this little celandine the heirloom of the ages.

therefore it belongs not to me alone but to all mankind.

There is a quiet expectancy in the woods to-day which makes even the chance rustling of a leaf or the flutter of a hidden bird of importance. What does Nature see with that deep gaze of hers? For what is she waiting so intently?

Below the stirring of the sap, the pushing of many roots, the toilsome burrowing of mole and miner, below a hundred explainable noises, she listens for the vibration which accompanies the revolutions of the globe; she waits for the world to whirl round to the zenith and perfection of the year. How fast the world is whirling! Not for long shall spring-time tarry in its coming; already its initial wonders are completed underground—for Nature, like genius, develops silently and from within: soon, soon the desire of the living sap shall be fulfilled; it shall reach the light, and find its supreme expression in myriad glistening buds, that shall burst their sheaths and shake out their leafy greenness to the sweet west wind and magic rain of spring. Every tree shall be clad in silvan beauty; even the rugged evergreen firs shall light their cones of rosy flame, the down-trodden grass shall take heart again, and birds and insects and flowers shall rush into life with an impetuous haste defying all mere chronicling.

But to-day that fertile perfection is still afar; the trees are bare, and no screen of tenderest green swings from the undulant boughs of that mighty beech to veil the tell-tale initials which I see a love-lorn youth entrusting to the care of the sheltering Dryad; and the grass is strewn with the drifted dead leaves of last autumn, and the brown needles from the firs are heaped upon the verdant mosses. The woodlands are wet with the rime of the early morning, and a chilly white gossamer stretches among the naked bramble sprays. And yet what full delight there is in this hour with Nature! In her vague spring promise there lurks at once a retrospect and a hope; regret and joy are strangely commingled, unrest takes possession of the heart, the blood stirs in an eager fashion through veins long chilled by wintry dearth of thought and feeling, and the heart hastens to send forth fresh shoots of impulse wherewith to greet returning spring.

I follow the wimpling stream that babbles of the unknown sea to which it is hastening, as it winds between gaunt columns of red-limbed firs, and observe numbers of conical little birds hanging on to the clay banks in some inscrutable manner; others wading in the shallow current, and hopping from stone to stone in search of insects, or preening their piebald plumage on the mossy bridge formed by a fallen tree. These tiny birds are wagtails, and it is interesting to observe their quick erratic flight—a sort of airy see-saw, determined probably by the efforts to escape made by the flies which are to me invisible.

The rocks, too, are very busy in the tall elms beyond the firs; they rock amid the leafless

boughs as if they were testing the strength of the swinging platform whereon they intend to establish their commonwealth, and in another clump of elms they seem to be engaged in patching up their old nests, conducting their frugal economy with a most prodigal expenditure of talk.

The glen just at this point is somewhat solemn and oppressive, and my feet lag among the tangled creeping plants and trailing wreaths of frost-carmined ivy. The influence of the firs is upon me, and I know that a feeling of solitude is waiting to assail me within their sombre groves. I miss, too, the snowdrops that transform a certain brown hill into a white and tremulous alp, and the fragile white-hooded wood-sorrel that I know is blooming in another beloved wood, bending over its sensitive trefoil foliage with an evanescent grace that will depart long before the ash-buds burst their black sheaths; and never in this sombre wood have the 'peaceful spears' of the daffodils pierced the damp red clay. But thanks to the poet, we can enjoy the 'jocund company' of the wind-blown daffodils even in winter—even when the frost-flowers obscure the pane—by means of

That inward eye
Which is the bliss of solitude.

I will not venture to-day within the noble temple of tall firs whose vistas open out as far as eye can reach. It is a fit chamber wherein to entertain noble thoughts and to adore the spirit of beauty, who has a home here if anywhere on earth. But see you this mossy stump of a lightning-blasted oak? This is my chair of Merlin. Here in high midsummer I often sit and 'lose myself that I may save myself.' Will you try it? Mark how the enchantment of the magic chair begins to take effect. Lo! the dust which you share with Nature is transformed and purified. Inspiration begins to flow through your veins just as the sap flows through the passive boughs of the trees, and, before you are aware of it, a spring-tide of the heart is yours as surely as that leaves shall soon be green again upon every tree, for material Nature and material humanity have passed through the alembic of immortal spirit, and both are instinct with that essence which is the source of all life.

But now I have arrived at the top of the glen, and it is with a feeling of satisfaction that I find myself upon the broad highway, for there is no denying that in the green solitudes which I have left behind I felt merely an intruder and a spectator, of far less importance in Nature's eyes than the meanest hare that ever limped along her dusky moon-haunted leas. The highway stretches broad and gray between hedges of beech and hawthorn, through the leafless branches of which I obtain a glimpse of undulating furrowed fields, separated from the woodlands by green and winding footpaths that are a continual joy to the lover of Nature, for their leisurely curves are innocent of those perfidious 'short-cuts' that tell of human hurry.

Time is measured here by the slow-moving shadow of yonder solitary tree standing in the midst of that half-ploughed field from which a lark has just sprung singing into the sunny sky,

and by the ever-changing procession of the flowers which love to follow mankind, and o glorify with their bright approval the margins of his well-tilled fields.

JOHN VALE'S GUARDIAN.

CHAPTER XIII.

SNELLING, taking his seat at the breakfast table punctually at eight o'clock on the morning of John's disappearance, folded his paper conveniently for the study of the market quotations, poured out his coffee, and attacked the dish of ham and eggs provided for him like a man who meant business. He did a little Corn Exchange gambling in his way, and the quotations of that morning were unfavourable to his speculations, so that he was a little out of temper, and was prepared to be something more of a martinet than usual. A little temper, as he found by experience, gave an edge to appetite, and he cleared the dish before him with unwonted expedition. When he had finished, he gave an angry jerk to the bell.

'Where's that boy, Mrs Winter?' he asked, swelling himself with offended and offensive dignity. 'I look to you to teach him better manners than this—keepin' his elders waiting.'

'You don't seem to have waited, sir,' said the housekeeper.

'Hillo!' returned Snelling, 'you're a-beginning to chop logic, are you? I should ha' thought you'd had enough of that with that husband of yours. When I talk of the b'y keeping his elders waiting, I talk of the b'y's intent, and the hobvious natural result of his action.—Send him here at once; and tell him that if he doesn't come along pretty sharp, he'll find a flea in his ear when he does come. Just you tell him that, and don't take the trouble to answer me back again in future when I speak to you.'

The pale housekeeper accepted this with becoming meekness, and left the room. After the lapse of some ten minutes, Snelling rang again, and she returned.

'I've looked for Master Vale everywhere, sir, and he isn't in the house.'

'Very well,' said Snelling. 'Tell him there's no breakfast for him when he comes. Children must be taught orderly habits. I was taught orderly habits myself when I was young, and I've lived to be thankful to them as instructed me.'

Mrs Winter set the breakfast things upon a tray, and was about to leave the room, when her master again addressed her. 'Isaiah's got his orders for the day, and I've got business to do at Lichfield. I shall be back by tea-time. You needn't trouble to cook anything. You and Master Vale can make shift with the cold mutton, and we'll have it hashed for to-morrow.—You can go.'

There was something which soothed his vanity inordinately in the burly patronising dismissal

with which he always closed an interview with a dependent. He was better tempered after this slight show of authority than he had been before it, and he set out upon his two-mile walk to the railway station in tolerably good spirits. He rarely for a moment forgot in his waking hours that fell intent of his with regard to his ward and nephew, though he never allowed the veil of respectable purpose which overhung it to be withdrawn for more than the merest flash of time. It was not his fault, he told himself, if, in spite of the most earnest application on the part of John's schoolmaster, and of the most constantly tormenting vigilance on his own, the boy grew sillier and more vacant day by day. Mr Snelling had good hope, though he told himself that he had a serious fear of it, that in course of time his ward might degenerate into mere idiocy. He spoke about this with a weighty aspect of decent sorrow to a dozen people whom he met that day; and one or two of them, over a pipe and brandy-and-water after the farmers' ordinary, agreed that it weighed on Snelling's spirits, and was a sore affliction to befall any man who had neither chick nor child of his own.

He did his day's business, and went home again, to learn that Master Vale had not presented himself at dinner-time. Without being much disturbed in any way by this intelligence, but thinking that it might open up the way to wholesome discipline, he took his hat and walking-stick and strode off to see Macfarlane. The boy had not been to school. Even yet, there was nothing very surprising or remarkable. The day had been unusually fine for the season of the year, and Snelling decided that John had played truant.

The schoolmaster told him something of the events of the previous day, and Snelling nodded in grave approval of the history. 'He's played truant,' he said, 'to avoid a hiding. Now, if I had to do with a boy's education, that'd be as short-sighted a policy as he'd ever learn how to start upon.'

'Why, yes, sir,' Mr Macfarlane assented; 'it is not a long-sighted policy. But boys, Mr Snelling, live very much in the present, and are not accustomed to look far into the future.' Macfarlane offered this pearl of wisdom to his client with a manner so impressive that Snelling received it quite respectfully.

'You are experienced in their ways, Mr Macfarlane,' he responded, 'and I mek no doubt that you will be able to give an account of my neww John when the time comes.'

So they parted with the mutual unexpressed understanding that whip and rein should be applied to nephew John with increased severity; and Snelling went home to await the truant's return, and on his way prepared an address for which he augured the most pleasing results in his own interest.

When the early spring dark had fallen and John was still absent, the good man was troubled by conflicting hopes and fears. There was a railway cutting in progress in Castle-Barfield in these days, and a month or two before, a boy had been killed by a clay-laden line of lorries running down a steep incline. The memory of this disaster dwelt in Snelling's mind, and if

anything like it should have befallen John, he felt that it would only be fitting and natural. Providence would have dealt well with him in removing that absurd obstruction which stood between him and the estate he had so strong a moral right to. He was not an imaginative man by nature, but fancy woke at this delightful possibility, and he saw with unusual clearness the things that would happen if his thought were true. He even planned John's funeral, and practised a little bit of economy by a second employment of the gloves and hatband he had worn at the funeral of John's father. Then fancy carried him a little further, and he saw himself established in the house of the late John Vale, farming his own land, and respected on all sides as a typical English yeoman. If he had known better how to be ambitious, his ambitions might have soared higher with him; but beyond that estate of English yeoman he knew not how to carry himself in imagination. There was a desire in his mind—so deeply rooted that he was nine-tenths unconscious that he was unconscious of its value—to own land, to be an actual proprietor of so much soil. Very few of his ideas presented themselves with neat edges. He was a stupid man, and most of his mental perceptions were blurred; but the joy of being absolute master, lord, and owner of a single acre presented itself with a definiteness which hardly any other conception could have commanded.

He was an intensely respectable man, and went to church with admirable regularity every Sunday, and there welcomed the creed that he who wishes the death of another is in his heart a murderer. But there is nobody so morally hopeless as the man who being gangrened considers himself sound.

Snelling had his lecture ready; but John never came to hear it. He waited until midnight, and was more fluttered by his imagination than he ever had been in his life before. Isaiah had long since returned from his business excursion in the country, and Mr Snelling found himself at length so moved that he was impelled to send for him and ask his opinion of the case.

'Well, gaffer,' said Isaiah, when Snelling, with a laborious concealment of his own hopes, had laid the position of affairs before him, 'I should think the best thing to be done would be to give notice to the police.' He offered this advice half in uncertainty as to the wisdom of his own action.

'The lad may have stayed somewhere,' said Snelling, who was in too pleasing a state of doubt to desire to dissipate his own hopes too early. 'Him and young Gregg; at the Hargate Hollow was always great companions; and as I learn at the school, where I've made inquiries already, John and young Gregg was both chastised there yesterday, and th— may have played truant together in revenge. Then, it's quite as like as not as, being loaded with a guilty conscience, the by may have got himself smuggled in by his companion.'

'Well,' said Isaiah, with an air which might have betokened guilt to a more intelligent observer, 'it's like enough that there might be something in that idea, master. Perhaps I might walk over

to Farmer Gregg's in the morning and make inquiries.'

'You may, Isaiah,' said Snelling, with all the dignity appertaining to the position he had held in fancy for the last two hours. 'You had better set out pretty early. In the meantime, it's quite unlikely that we shall hear anything more of the lad to-night, and we'd best go to bed.'

'Very well, gaffer,' said Isaiah; 'I'll set off first thing.'

Snelling stopped him before he had reached the doorway. 'Hold on,' he said; 'I'll go myself. Have me called at six o'clock, and tell your missus to get a cup of coffee ready.'

This terminated the interview; and Isaiah, who was unused to concealment, was not sorry to escape. His wife was full of womanly doubts and terrors, and he had hard work to keep his secret from her.

Snelling set out next morning, according to promise, and found Farmer Gregg at breakfast. Gregg was a man whose long association with cattle seemed to have bred a certain bovine likeness in himself, a short-faced, red-complexioned man, with something of the immovable rigour and dull angry resolution of a bull going at a gate. He was thick-necked, thick-set, and short-sighted, and carrying his head always a little bowed and thrust forward, looked with his myopic scowl as if he were ready to charge anybody or anything at any moment. He was not a bad-hearted fellow in the main; but he had been bred in the harsh old school, in which pain was somehow supposed to be a good thing for children; and he thought that he did no more than his fatherly duty by carrying on to the account of his son the bitter and cruel sore a father built on his own pattern had so rigorously kept with him. For the rest, he was the soul of honesty and bull-headed self-opinion, as obstinate as he could stick, and utterly loyal to the convictions which had been born with him, whether they led him to despise the new-fangled invention of oilcake, to reverence the Church and Queen, or to hate and despise all foreigners.

In his own way he had been disturbed by his son's disappearance. The open door, the broken money-pot, and the ransacked box in Will's chamber, had already told him the story of a probable flight. So far, for he was a man who never thought in a hurry, he had resolved on nothing more than to repeat the dose which, to his mind, had brought on the disease. If any boy of his were so obstinate as to persist, in refusing to be cured by that medicine, it was likely to go hard with him; and any notion of changing the treatment according to any symptoms exhibited by the patient was out of the question.

'That thee, Snelling?' said he, when his Castle-Barfield neighbour appeared. 'What's the news with thee?'

'I thought it might have happened,' Snelling answered, 'my nephew and your son Will being such close companions, as the lad might have been here. He's been missing all night; and seeing that he's no better than a bit of an idiot, and can't rightly be held responsible for his actions, I thought it my duty to make inquiries about him.'

'He's missing too, is he?' asked Gregg, glancing

short-sightedly at his visitor from under his brows, as if he were making ready to butt him, and only waiting to choose the spot where action would be most effective. 'Ah! there's a pair on 'em, then.'

'You mean to tell me as your lad's gone too, Mr Gregg?' asked Snelling.

'Yes,' the farmer answered; 'he's made a clean bolt on it. He's broke his money-box, packed up a little parcel o' things, and was off yesterday morning afore daybreak. I gin him a lacing the day before yesterday, and I suppose he's took offence at it. I run away from this ere very house myself when I was a lad; but my feyther he ketched me up at Stafford, and g've me such a hiding then and there that I settled down in great contentment afterwards, and was no more trouble to him. I remember it as if 'twas yesterday.'

'Ah!' said Snelling slowly, 'they've gone away together, have they? And what do you reckon to do about it, Mr Gregg?'

'Reckon to do about it?' the farmer answered. 'Well, I don't know as I reckon to do anything about it in particular. To look for a runaway lad about the country 'd be like looking for a needle in a haystack. He'll come back, I reckon; and when he does, we shall make up our accounts together and go on again. I don't bear the lad no malice for pluckin' up a bit of a sperrit; and when he's got tired of being hungry, he'll find his way back to the manger, and then we'll see who's master, him or me.'

Whether on the whole it were not as well that John should run away and be no more heard of, as that he should be got out of the way by any lengthier process, Snelling could not say for the moment. There was the possibility of a doubt everywhere. If he stayed at home, he might recover his wits in spite of the best intentions; and if he ran away he might come back one of these days to claim his own. There was a plaguey absence of certainty about the business as it stood.

'We must do something, Mr Gregg,' he said solidly. 'If there's no news of 'em in a day or two, we shall have to advertise.'

Gregg had a great respect for Snelling's intelligence. Snelling was not over-educated, to his mind, but had yet a trifle more book-learning than the run of people in his condition. There was a sensible difference between his English and that of the majority of his compeers; and though he talked in a good old-fashioned Barfield accent, he never condescended to thee and thou with anybody, and being a competent, solid, and well-to-do man, this reticence in familiarity helped to give him a certain personal weight. The idea of advertising was novel to the farmer, and on that ground alone would have seemed objectionable. Still, there was no denying that the world was changing, and that progress was the order of the day; and if so respectable and conservative-minded a neighbour as Snelling thought it was the right thing to advertise, perhaps it might be.

'Thee wootn't have had breakfast yet, Snelling,' he said, when he had given these dim reflections time to form. 'Thee'st better sit down and pick a bit. Theer's a cold goose i' the cupboard, and the beer's my own brewing.'

Ms Gregg had never yielded to the effeminate

innovations of tea and coffee, and he counted good ale among the greatest blessings which had been bestowed on man. In his childish days he had heard his grandfather speak with scorn of the village Squire who had 'gone foreigneering and had brought home yarbs to make slops with; and the grandfatherly despite had entered into him and become a part of him. Snelling assented to his invitation, and did justice to the cold goose when it came. Before he left, it was decided that if the boys were absent for a week, handbills should be printed and placed in the care of the police, and that a joint reward of ten pounds should be offered for such intelligence of the fugitives as should lead to their return.

'It's to be understood, look thee,' said Gregg, 'as if my lad comes back and thine doesn't, I find a fiver for the man as brings him; but if it's thy lad as is found and not mine, it's thee as pays the money.'

Snelling agreed to this, and they separated to await events. Nothing being heard of the boys at the expiration of a week, the services of the Barfield auctioneer, who was an acquaintance of Snelling's, were called into requisition over a glass of grog and a pipe; and a description of the missing boys was drawn up, from which it might have been inferred that young Gregg was a hardened habitué of the Old Bailey in aspect, and that John was an idiot of theatrical pattern. Both the boys' names, their ages, and their dress were accurately set forth, and the names and addresses of Robert Snelling, Corn-Factor, Castle-Barfield, and William Gregg, of Hargate Hollow, Beacon-Hargate, were set forth in evidence of the responsibility of their owners. The hand-bills were scattered far and wide; but week after week went by and nothing came of them. Month after month went by and nothing came of them. Snelling made a mighty to-do in his own slow, respectable manner, as might have been expected of him. Farmer Gregg being tempted by the peculiar suppleness of a riding-whip offered him by an itinerant vendor, on a market-day, bought it and laid it by as a means of welcome for Will's home-coming. But as the slow days and weeks and months dragged on, and brought no tidings, his mind changed slowly, and one night, about Christmas-time, he broke the whip into pieces and burned it, for his dour heart misgave itself, and some dim stirrings of fatherly affection made themselves felt there. But he said nothing, and was supposed to feel nothing; whilst Snelling was pathetic about his bereavement, and was popularly believed to be somehow aged by it.

It was in the likelihood of things that with every day that passed him by, his hold upon John's belongings should seem more and more secure, and that in a very little while he should begin to feel as if the landed and funded properties were actually his own. He was sole executor, and there was therefore nobody to come in between him and his dreams. In case of the boy's death or disappearance, he was heir-at-law, and he had undisturbed possession already.

When John had been absent for a year, Uncle Robert found an excellent opportunity for disposing of his business as a corn-factor. He had put a farm-bailiff into the house of his deceased cousin and had run the farm for a year past. He gave this personage a quarter's notice after the

sale of the business, and installed himself in the farmhouse with Mrs Winter as housekeeper, and Isaiah to assist in the superintendence of the mill and malt-house. He lived religiously on his own income, and kept books in which he set down to a farthing the receipts of his nephew's property. He was fond of displaying these to his cronies, and of saying what a pretty penny the lad would have come in for if he had never taken it into his poor injured head to wander off, Heaven alone knew where, and leave these fair possessions behind him.

'Dear, dear,' Mr Snelling would say, 'if this had only fell into my hands years ago, I might have married a second time and had children of my own. And now, even if the poor lad should never turn up again, what's the good of it to me? I've more than enough of my own, and riches is nothing but a trouble to a lonely man.'

So altogether Mr Snelling was highly respected, and grew in favour and repute.

FOREIGN TITLES.

CONSIDERING the marked love of everything aristocratic with which we as a race are credited, there is confessedly an inconsistency in the manner in which English people generally regard the matter of foreign rank. Whether it be that the veneration in question has been too cruelly played upon by a number of unprincipled adventurers bearing high-sounding titles, or whether it be that a century or so of continental revolutions has driven to our shores a crowd of sorely impoverished noble *émigrés*, it is impossible to deny that we show a marked indifference to the claims of foreign rank to that awe-inspiring power which is possessed by titles of native origin. To some extent, of course, this feeling may in a sense be traced to the absence of any easily available means of reference as to the social status of any new acquaintance claiming to belong to the foreign nobility. Burke, Debrett, or Lodge are practically within a moment's call to settle any dispute or doubt respecting English persons of title; but not so the *Hof Kalendar*, the *Almanach de Gotha*, Bachelin-Delforenne, or Count Litt's bulky tomes.

On account of this difficulty of obtaining accurate or even inaccurate information respecting the foreign nobility, there exists in the Anglo-Saxon mind on both sides of the Atlantic a nebulous state of knowledge as to the bearings of foreign rank, and apparently a depreciatory estimate of its real social value. Perhaps this in a measure is due to the fact of the very large number of persons who by foreign rules of heraldry enjoy the privilege not merely of noble birth but of its attendant right to title, a view to some extent justified by the statement that in one Russian family alone, the Galitzins, six hundred of its members are entitled to rank as 'Princes.' In this connection, perhaps no foreign title is more generally misunderstood in England than that of 'Prince.' Though we in our country solely associate such a title with the children of our sovereign or those of a reigning foreign ruler, it should not be forgotten that, heraldically speaking, all English Dukes, Marquises, and Earls are 'Princes,' a statement which will perhaps serve

somewhat to explain how it comes about that it is not every foreign Prince who is a 'Royal Highness.' There are indeed foreign Dukes who rank above Princes: the Italian Brancaccio family were created Princes in 1391, and Dukes only three hundred years later. In France, which though at present ruled by a republic, still tenaciously retains socially many of its monarchical traditions—there are Dukes whose eldest sons bear the title of Prince. Thus, the children of the Duc de Broglie, who is a Prince of the Holy Roman Empire, are all Princes, and their lineal descendants in the male line. The children of the Belgian Duc de Looz are likewise Princes and Princesses. Though abroad it has of late grown into a too commonly observed custom for those of recognised noble birth to be addressed by the title of their fathers, yet heraldically, as with us, that right rests solely with the head of the house, the eldest son, while assuming the family name, taking the next rank. Thus, the eldest son of a Duc de Choiseul will be a Marquis de Choiseul; his second son, Comte de Choiseul; his third, Vicomte; and so on.

Had such a custom prevailed in England as exists abroad, and which permits each member of a noble family to assume the rank of its chief, it is curious to think how numerous would be the personages in this country bearing titles. Allowing that all the posterity of the head of the Buccleuch family, whom we may term Baron Scott, belonging to the lesser nobility, claimed a right to bear his title, Barons Scott would have been counted by hundreds. It is not, therefore, very astonishing to learn, on the authority of Sir W. Lawrence, that in Russia there are over half a million of nobles; in Austria, some three hundred and forty thousand nobles; in Spain, a century ago, there were nearly half a million; while in France at the Revolution there were three hundred and sixty-five thousand noble families, though of these latter there were only four thousand of ancient gentility. The very considerable number of nobles is of course explained by the fact that the class whom we should term 'gentry' are, abroad, included among the nobility.

But if we in England show our ignorance as to the real value of foreign titles, nothing could be more amusing than the erroneous impression held even among educated foreigners as to the relative position of our nobility and gentry. Of this latter and most important factor in our social system, continental society takes no account, as being unprovided with any title; a similar distinction accorded to the younger sons and daughters of peers, whose right to nobility it is very difficult to induce a foreigner to understand. On the Continent, the impression prevails that no Englishman can be noble who does not bear the title of 'Lord,' and it is a point which demands no small linguistic fluency to succeed in convincing a German that our English barony of the realm is not of the same rank as the pettiest Austrian Baron who can buy his title for a few pounds. That there should be Baronets whose families, like those of the Temples, the Watkins Wynns, the Tishbornes, the Chetwodes, and the Burdets, were noble long prior to the Conquest, while the Premier Baron of the House of Lords (Lord De Ros) dates only from a century after

that period, constitutes a source of dire perplexity to the foreign mind, which freely confesses to an utter inability to seize the exact heraldic and social position of a Baronet; and yet in Germany, and indeed all over the Continent, the *uralt*, or nobility whose patents were granted so long ago as to be 'time out of mind,' are held in the highest esteem. The fact that there exists no established canon by which accurately to gauge the relative values of English and continental titles has often been a source of much heart-burning and mortification to travelling Britons of gentle birth but untitled rank, and of no small social advantage to many a petty foreign nobleman exiled to our shores.

Among the foreign nobility, none hold a higher or prouder rank than the so-called mediatised Princes of Germany, the descendants of those rulers whose principalities, on the dissolution of the German Empire in 1806, were annexed and absorbed into the kingdom of Prussia, the rulers of the separate states forming which, still retain their titular rank and are accorded semi-regal honours. Such mediatised Princes enjoy the style of 'Prince,' and are addressed as *Durchlaucht*, or Serene Highness. Of the many German Princes who belong to this rank, none, perhaps, is better known in England than Count Gleichen, who, before his marriage into our English aristocracy, bore, as brother of the then reigning Prince, the title of Prince Victor of Hohenlohe-Langenburg. The nephew of Her Majesty, Prince Leiningen, finds a place in the list of the mediatised Princes; next to whom, in foreign titular precedence, rank, by a decision of the German Diet some sixty years ago, the Counts who are entitled to the style of *Erlaucht*, or Most Illustrious. Directly associated with the 'Most Illustrious Counts' may be reckoned at least one English peer, the Duke of Portland, who, as a descendant of Bentinck, the favourite of William III. of Orange, is thus closely allied to one of the noblest of the foreign patrician families, the head of which, Count William Bentinck, resides in the country of his family's adoption.

In the consideration of the questions of foreign titles, few points are more interesting than this close connection of our aristocracy with that of the Continent, not merely through marriage, but through direct descent or personally gained dignity. Thus, on the long list of the Princes of the Holy Roman Empire who follow in rank 'the Illustrious Counts' may be enumerated no fewer than three English peers: the Duke of Marlborough, the Duke of Leeds, Earl Cowper; Lord Arundell of Wardour and Lord Denbigh being Counts of the Holy Roman Empire. Though the present heads of the Denbigh and Howard families respectively are permitted to bear their foreign titles, it was not without some opposition from the government on their original assumption. The Fieldings—who claim to be a younger branch of the Hapsburgs, Emperors of Austria—were plain 'Esquires' in the land of their adoption, and only obtained their Earldom through their connection with the Villiers; while Thomas Arundell of Wardour, in spite of his services against the Turks, only received his peerage at the hands of Queen Elizabeth, his cousin, in order that his English rank might outbalance that of his foreign title. 'I would have my dogs wear

my own collar,' shrewdly remarked Queen Bess on the occasion; and this is the view that to our own day has been retained in this country respecting the English assumption of foreign titles, which are only borne by direct permission of the sovereign. By this right, and this right only, the Duke of Hamilton bears the French title of Duc de Chatelherault, in France—long disputed with him by the Duke of Abercorn: by this right the Duke of Wellington bears the style of Prince of Waterloo in Belgium, and other foreign titles; the Earl of Nelson, Duke of Brontë in Italy; the Earl of Clancarty, the additional style of Marquis of Heusden in the Netherlands; and before his recent accession to the English peerage, Lord Rothschild, the Austrian barony by which he was so well known.

On any other ground, the assumption of foreign titles in England is purely a matter of courtesy, which might possibly be set aside by a punctilious Lord Chamberlain, if the holder desired to be 'presented' at court. Socially, however, such delicate points are not pressed; hence, a titled foreigner enjoys many advantages in that complicated code of precedence, the adjustment of which causes so much trouble to hostesses who entertain distinguished guests, and in the legal arrangement of which the bearer of foreign rank finds no place. None the less, it is a courteous concession for the head of a foreign house of undisputed nobility, whether Prince, Duke, or Count, to take his place after an English Duke. The existence of such a concession is traced to the still surviving traditions of the fascinating days of chivalry, when in the lists of a tournament a foreign knight's rank was never questioned, but precedence freely allowed him.

No foreign, though more particularly no French title holds a more esteemed place than that of 'Marquis,' which, indeed, socially may be said to rank above that of Duke, for the very simple reason, that while the First Napoleon created a large number of Dukes and Princes, he patented no Marquises, who, unless the sons of Imperialist Dukes, are therefore known to be of creation belonging to the days of the monarchy. Such points are of course difficult to determine without ready sources of reference; but in foreign society such distinctions are as familiar as are with us those which regulate the relative social position of the members of our aristocracy.

It is a distinction not always thoroughly understood, that which exists between political or peerage nobility and nobility of blood. A gentleman of blood being already noble, cannot be further ennobled by being raised to the peerage, though his rank and privileges are thereby augmented. This is a point which, if it is not always clear to the English mind, it is difficult to explain to the foreigner. He, however, perhaps better than the Briton, can grasp the meaning of the amusing anecdote of the Spanish grandees, who, signing their consent to the accession to their throne of the French Philip V., wrote each against his name, 'Noble as the king'; one, however, adding, 'and a little more'; 'for,' he said, 'Philip V. is a Frenchman; while I, I am a Castilian.' Though it is a colloquial fiction that every Spaniard is of noble birth, it must be remembered that it is only the heads of the Spanish noble families who bear the title; the eldest son

of a Duke being known during his father's lifetime simply as 'Don Alfonso di —.' It is perhaps not familiarly known that a Spanish title is by no means an inexpensive luxury. The rank of grandee costs about one thousand pounds; and while with us a ducal title entails an outlay of about thirteen hundred pounds, it must be remembered that it is only the original recipient who pays this sum, which in Spain is renewable on every fresh assumption of the title. This is but poorly recompensed by the right enjoyed by all Spanish grandees of remaining covered in the presence of royalty, a privilege confined in this country to the family of Lord Forester and Lord Kingsale.

The mention of Spanish nobility affords an easy transition to that of the Netherlands, the bluest blood of which traces its origin to the days of the Spanish occupation. The holders of title in Belgium are divided into two classes, the former of which derive their titles from the old Austrian Empire; those ennobled by the successive rulers of the Netherlands since Napoleon's conquest taking in the social hierarchy a very much less enviable situation, however high-sounding their titles.

Amidst the complications of the code of precedence, which abroad causes no less trouble than with us, deserves mention from its connection with our country the hotly disputed quarrel of the Maltese nobility as to this very point, which was only finally settled by the Foreign Office determining that there existed twelve noble Maltese families, whose precedence should be regulated by the respective dates of their creations; in accordance with which simple arrangement the social machinery of Maltese intercourse has been able to proceed with less friction than formerly.

Rank in Italy is neither so rare nor so costly as in Spain, not a few titles, such, for instance, as that of Prince of San Donato, being derived from the possession of certain estates, a relic of feudal law long since abolished with us, but, curiously enough, still technically retained in the case of Arundel Castle. The Princes who enjoy the equally feudal privilege of erecting a *ballacchino* in their great halls are, however, an envied minority. Customs vary in Italy respecting the social assumption of title. In Northern Italy, the son of a *marquess* is styled *cavaliere*; while in Roman society he would probably be known by the same title as his father, though the younger son of a princely house will simply have engraved on his visiting card his Christian name and surname with the addition '*de Principi di —*,' and above this a princely coronet.

Few points are more puzzling, alike to the foreigner and the Englishman, than this matter of the right to the use of the coronet, it being a cause of surprise to the former that a baronet, and still more the younger son of a peer, who, he is informed, is of 'noble' birth, have no right to a coronet. Thus it comes about that the younger son of the peer whose courtesy title of 'Honourable' it may be mentioned, is utterly untranslatable, holding a diplomatic post abroad, but without a right to use a coronet, is given no credit for being the equal of the youngest son of a baron whose father was perhaps a courtier.

So little, indeed, is this question of 'nobility' understood even by English people, that there are sons of peers who in foreign society, if asked whether they were 'noble,' would perhaps thoughtlessly answer in the negative, because not bearing any title, when, as a matter of fact, they might claim precedence on the score of birth over many a Graf, a Comte, or a Marchese. Should he endeavour to explain that as a member of the Lower House he was merely a 'Commoner,' he would probably simply succeed in impressing his foreign friends that he was nothing but a plebeian. The relative positions of the 'gentry' and the 'nobility,' which with us are, by those interested in such matters, thoroughly understood, might perhaps be best summed up to the inquiring foreigner by stating that what we call 'gentry' they would term 'noble;' and what we call 'noble,' they term 'high noble.' This, indeed, is the gist of the explanation once afforded to a German by the author of a curious little work anonymously produced by 'A Traveller' in 1842, entitled *British and Continental Titles of Honour*, a little volume which owed its existence to the many errors that the writer found to prevail as to the relative rank of those bearing titles at home and abroad. The reciprocal puzzles of English and foreign titular rank are indeed many, nor are they likely, in an age like the present, to be more satisfactorily regulated than they have been over the many centuries during which their peculiar significance, freely though it has been acknowledged, has steadily tended to lose ground.

ASTBURY'S BARGAIN.

A STORY IN SIX CHAPTERS.

CHAPTER V.—ALMOST 'TOO MUCH JOY.'

OVERTON PARK was within an hour's easy drive to the City, and one of the prettiest places in the picturesque district of Norwood. The grounds extended to about fifteen acres, and were surrounded by magnificent beeches, oaks, and elms. The house was outside in the style of a baronial castle, with minarets, buttresses, and a clock tower; but within, it was arranged on the most approved modern principles of comfort and convenience. There were green terraces reaching down to an extensive lawn, surrounded by a dense shrubbery of holly and rhododendrons. Beyond was the park, where all the year round a few deer might be seen tamely nibbling the rich herbage, undisturbed by the two cows which shared the pasture, or the traffic along the beech avenue. The place had been purchased by the late John Ellicott from the executors of an eccentric gentleman who, combining admiration for ancient architecture with a due sense of the advantages of modern improvements, had built the house and arranged the grounds according to his own views. Overton Park was now the property of Mr Ellicott's nephew, who brought his young wife home after a pleasant sojourn on the Riviera.

There never had been such a tender and devoted husband as Henry Dacon, not only

during the honeymoon, but in the months and years that succeeded it. The chief aim of his existence seemed to be the discovery of some new means for affording his wife pleasure; and he was brimful of joy whenever he succeeded in giving her some unexpected and pleasing surprise. She had no wish, no whim even, however extravagant, which was not immediately gratified. He passed the recognised bounds of a husband's most transcendent proofs of affection—he not only made his mother-in-law welcome to the house, but he showed her every token of respect at home and abroad. No mother had ever before known such a paragon of a son-in-law. He had made the most liberal settlements on her daughter, and by his attentions made her the envy of all the matrons in her circle who had daughters married or to marry. The widow fully appreciated the advance in social estimation thus gained, and was intensely proud of it. But she contrived to wave the flag of triumph so discreetly that few could say she was unduly vain of the good fortune which had befallen her and her daughter.

Every one who had any intimacy with the young wife assured her that she had drawn a big prize out of the matrimonial lucky-bag; and she would answer frankly that she knew, and was glad and grateful for it. She began almost to fear that Dacon was too good. As long as a year and a half after marriage, when baby Hetty was full seven months old, she had the exceptional privilege of chiding her husband for his too great eagerness to satisfy all her fancies. 'I do think, Henry, you want to make me believe that I am the mistress of an enchanted palace where I have only to wish—say, for the moon, and it would be brought to me.'

'Or you might be whisked up to the moon,' he answered, laughing as he kissed her. 'Why, what is there in the world that I care for except to make you glad?—always glad that you chose me for better for worse. I have got the "better," and I hope you will never think that you have got the "worse."'

'No—never, you foolish old man,' she rejoined, patting his cheek fondly.

'Well, you have not wanted anything out of the way yet—at anyrate, nothing that the simple signing of a cheque could not provide.'

'Are you not afraid that by being too good to me, you will bring on a fit of satiety, and I may grumble because you cannot give me something that is beyond the reach of cheques?' she asked with playful gravity.

'I would try to get it,' was the cheery response, 'by favour or force; and if I failed, then I would trust to your wise head to understand that it was not my fault.'

'But if my wise head would not understand, and I still cried for the unattainable—what then?'

'I should be wretched until you came back to your senses and did understand.—You are dreaming about something unusual now. What is it?'

They were in Hetty's boudoir—a place sacred to themselves except on 'company' nights—and she was resting on his shoulder, passing her fingers fondly through his hair. He looked up smiling at the prospect of some easily satisfied

demand being the finale to this portentous introduction.

'I was thinking about Daisy.'

'You say that as solemnly as if she were laid up with some serious illness. Certainly, we do not see so much of her as I know you would like; but we must make allowances for an authoress who is absorbed in the production of a *magnum opus* which is to set the Thames on fire. Let us hope it will, and that she may be content with the blaze. But I hope you are not going to charge me with the task of seeing that the fireworks go off properly, for that would be too much for me.'

'I don't like you to make fun about her work, Henry—she is so earnest over it; and you know that some publishers have acknowledged she has talent.'

'I am sure she has, and I had not the least intention of jesting about it. My little joke was meant solely to drive that shadow from your face. Is there anything the matter with her?'

'I am afraid there is,' continued Mrs Dacon pensively; 'and you have made me so happy that I feel her grief the more distressfully.'

'What is the trouble? Can we do anything to relieve her of it, or at least to lighten it in any way?'

'I wish we could, and I know that you wish it as much as I do. But I fear we cannot do anything.'

'Then, as we cannot, you must take comfort from the old saying, "What can't be cured"'

'Don't!' exclaimed the young wife, laying a finger lightly on his lips. 'You must be serious, Henry, or I shall be silent. The something which cheques cannot enable you to do for me has turned up at last.'

'There are few things which love supported by a good bank account cannot accomplish,' he rejoined encouragingly. 'Come, out with it, and give Sir Galahad a chance of proving his mettle.'

'You are not serious yet,' she said with mild reproach, 'although I have told you that the subject is distressing me so much. But I will tell you what it is. Daisy is very ill—she is moping her heart out because Gilbert is banished, and she will never know happiness until he is brought back.'

He became serious enough as these words were spoken, and the wife felt that he involuntarily drew a little away from her, whilst she, in surprise clung the more closely to him.

'I have not annoyed you, Henry; I hope I have not done that?' she pleaded.

'No, no, Hetty,' he answered gravely; 'not annoyed me, but bothered me, for you have found out the thing I cannot do for you. Remember, even if I could bring Astbury back to England, I could not compel him to love your cousin. You cannot have forgotten that it was another person he cared for, and she knew it.—I am sorry for her; I am sorry for him; but I don't see how to help them in the way you want.'

'Yes, I know it is impossible, and wish I had not spoken about it; but she is suffering so very much, and all the more because she tries to hide it. If she would only unburden her mind by telling her sorrow to somebody, she would be better; but she will not say anything even to me.'

'It is better that she should not,' he said abruptly, as if irritated; but he instantly subdued his voice and continued: 'Still, seeing you so anxious on the subject, she might have told you that I have already done all I could for them both.'

'You have!—O Henry, you make me glad again. She must have said something to you, then?'

'Yes—not much; but remembering the information you gave me I understood her, and opened the way for them to correspond.'

'Then you knew where he was!' she exclaimed in amazement.

'He wrote to me,' was the reply, with a restlessness he had not previously exhibited in their private conversations.

She clasped her arms round him, her heart throbbing with pride and affection. 'You knew all the time, and yet incurred that great loss rather than betray him!'

He endured the embrace; he could not respond to it. 'I told you at the time,' he said coldly, 'that I did not believe Astbury guilty. But I think, Hetty, a little reflection will convince you that the seldomer his name is mentioned between us the more comfortable it will be for me.'

'I will never speak of him again,' was the impulsive promise. 'But it is a pity, since you are so sure of his innocence, that he cannot return. They might come together and be happy—like us.'

She did not return to the subject after his declaration that it was unpleasant to him—although her notion was that it ought to have been quite the reverse, considering how nobly he had acted throughout towards a rival who would have triumphed by defaming him. But, of course, she had not told him what Gilbert had suggested, and she had so sternly repudiated. She kept her resolve, and never did tell him.

Dacon had spoken truly. He had done his best to meet Daisy's wishes. He not only asked Gilbert for leave to give her his address, but frankly told with what fervour the girl, strong in her conviction of his innocence, had declared her resolution to bring him back to England, in order that his good name might be cleared of every stain with which calumny and misapprehension had daubed it. He went further, and told Gilbert that if ever a woman loved a man, Daisy Forester loved him; and added—with unintentional coarseness, arising from his selfish desire to get her out of his way as much as to console the exile—that it would not be difficult to persuade her to emigrate to South America.

That letter brought one from Gilbert to Daisy by the next mail. 'The account Dacon sends of your faith in me,' he wrote, 'has given me unspeakable comfort; and if I could only know that Hetty shared it with you, I should be quite happy. I can now tell you, for your satisfaction, that my complicity in the affair is to this extent: I discovered who the culprit was, and for reasons of my own, determined to hold my tongue, even if the blame should fall upon me. What these reasons were I cannot explain even to you; but you may be sure that they were strong ones, or I would not still be an exile and a dishonoured man in the eyes of almost every one who knew

me as Gilbert Astbury. I am now Edward Harrison, accounted here a most fortunate man, for my success has been beyond my most extravagant expectations; but it does not compensate for what is lost. I shall be glad to have news from you whenever you care to write, and above all things, glad to learn from you that Hetty is happy.'

In this he delicately indicated that the old love was still strong within him. If Daisy had entertained a hope of her cousin's marriage having so changed the nature of his regard for her as to permit his affection to settle elsewhere, it would have been dispelled by this communication. But Daisy was not thinking of winning him for herself. Feeling sure that no matter what happened to him—whether he died or married—she could never love any other man sufficiently to become a wife—she was equally sure that his affections could never be transferred to her or anybody else. But because she loved him so, she wanted to see him put right before the world. She wanted to see him back in his native land, and able to hold up his head amongst those who now believed him guilty. She was irritated at the idea of him skulking in a foreign land under an assumed name, and it was no consolation to her to know that he was successful in business. All the riches of Golconda were in her eyes worthless if good name had to be sacrificed for them.

But what could she do? Tell him that she was angry with him, that she utterly disapproved of his conduct, and that, after racking her brain for every conceivable excuse for the course he had adopted, she could find none? She did tell him, and the result was the sad response that he could not attempt to justify himself to others because the motive which actuated him could only be understood by himself. He did not mean to return to England unless he learned that Hetty was unhappy and in need of help. He implored Daisy not to despise him for his weakness, but to continue writing to him, for her letters brought the sunshine of home into his exile's dwelling-place, making him feel strong and content.

She wished him to return; but she could not offer him the one inducement which he declared would bring him back. She could not tell him that Hetty was unhappy and needed help; for every day she saw fresh proofs of her cousin's perfect contentment with her lot, perfect satisfaction in her husband and her pretty little daughter. Daisy could only report these facts again and again, but without once expressing surprise or curiosity at the singular condition on which Gilbert would alone attempt to reverse the doom of banishment he had accepted. Before this correspondence, she had suspected the reason why he had become a fugitive, and now she knew it. She believed he was wrong; but she could not endure to vex him by the constant iteration of that verdict. She wished to help him; and so wrote as pleasantly as she could, giving in reply to his minute inquiries every detail at her command of Hetty's life and of the growth of little Hetty—the prettiest, fairest, and merriest child that had ever been born.

The letters became to Gilbert the most important of each mail, the first sought and the first opened. He could fancy that he heard Daisy's

voice as he read the words ~~she~~ penned; and he could see her quiet sweet face watching him with that earnest sympathetic expression he remembered so well in her soft blue eyes. He gave her by every mail a sort of diary of his progress, as some small compensation for the labour he entailed on her in his greedy desire for news from home—news of herself, her aunt, and of the Overton Park family. She, with no other desire than to console one who had sacrificed and suffered so much, replied faithfully and truly to each letter. Unconsciously, she saved him from falling into the morbidly bitter state which is often the consequence of disappointment on an ardent generous nature. The activity with which he pursued his work after receiving each missive made him aware of the happy influence she was exercising over his career, and he was profoundly grateful to her. When he said 'good-bye' to her at the garden gate of Cedar Cottage he had fancied that he was passing into the valley of gloom, from which he would never again emerge. But youth and health were on his side; and Daisy had raised a beacon to guide him through the darkness of a troubled mind. He began to wonder sometimes, in a vague, dreamy way, why such a woman, beautiful, gifted, and capable of great love, should not yet have found a companion-soul worthy of such a treasure.

It seemed strange to him now, that he had never thought of this before; and with the thought came a chill as he reflected that her letters would cease when—as must happen some day—she married! He had not forgotten Dacon's assertion that Daisy's heart had been given to himself; but he had put the idea aside as one of his friend's feeble efforts to console him at any hazard so as to keep him quiet. Daisy was, as she had been always, his dearest friend; but she having been his confidant all along, could have no feeling of the kind for him, or she could never have endured his constant harping on the one theme of his lost love. As he considered the prospect of the cessation of her letters, he became conscious that whilst the memory of Hetty was like that of one who had died years ago, Daisy was a living, near and dear presence to him.

One mail arrived and brought no message from her. He was uneasy, but concluded that she had somehow miscalculated the date of despatch. Another mail arrived without anything from her, and then he realised how precious, how necessary to him were those tokens of remembrance from Daisy Forester. He felt like one who has been toiling through a long dark night and has just caught the first glad signs of a bright dawn when he is suddenly stricken blind. Was the prospect of happiness which he had begun to see through Daisy's agency to be denied him? He did not like to telegraph; it would startle without enabling her to understand that he was mostly alarmed about herself, for he thought it could be nothing but serious illness that had arrested her pen.

He wrote; and his letter was crossed by one from her. Dacon had been very queer for some time, and Hetty was much distressed on his account. He was as fond and kind as ever, devoted to his wife and child—madly bound up in the little one, with whom he spent all his leisure, inventing amusements for her, and only

smiling when he was romping with her, capering about the lawn or the nursery with her. But he was not well, and Hetty was very miserable about him.

A REMNANT OF PAGAN SCOTLAND.

ON the southern shore of the Moray Firth, along six miles of the Elgin coast, runs a range of mighty cliffs wonderful to the geologist and the antiquary. They are indented with deep gloomy caves, formerly the resort of smugglers, and latterly the home of wandering tribes of Scotch gypsies. Several of these caves bear marks of their former occupants; and rude stairways cut in the face of the cliffs ascend to the top, where it is said the warlock laird of Gordonstown held converse with the smugglers; and by the compact which he had with the evil one, he was enabled to tell them whether their next venture would be successful or otherwise. The walls of one of these caves are curiously sculptured with mystic symbols, some of which are supposed by antiquaries to be of Eastern origin and of great antiquity. The cliffs also show peculiar and uncommon instances of false bedding and curious jointing; and where there is any considerable portion of flat surface exposed, gigantic footprints of extinct reptiles and other monsters of a far-past time can be distinctly traced. A little farther inland, the fossil remains of some of those creatures have been found in considerable numbers; and it was here the creature was first discovered which enabled Huxley to overturn the opinion of Agassiz, and which raised the famous geological dispute connected with the Elgin sandstones. But great as is the geological interest attaching to this bit of coast, the antiquarian is perhaps greater. There is here a custom called 'the burning of the Clavie,' which though at one time observed all along the Morayshire coast, is now observed in Burghead alone. This custom, as we shall see, probably points back to a remote antiquity.

At the western end of this remarkable range there is a headland running out into the sea, and crowning it is a quaint fishing village called Burghead. This headland was for ages held by the marauding Norsemen, even after their final overthrow by Malcolm II. in 1010; but before the Norsemen set foot upon it, there are those who believe that it was held by the Romans, and that it was the northernmost point reached in Britain by the conquerors of the world. Historical authorities, however, are not agreed as to this point. But be that as it may, there is one mark of paganism and one mark of civilisation which are both unique and difficult to explain. The former is the extraordinary custom already alluded to, 'the burning of the Clavie,' a custom of unknown origin and of unknown antiquity. This ceremony, which is annually performed on the 11th January—New-year's Eve, old style—is fast degenerating into a mere masquerade, and will probably in a few years be left in the hands of children or allowed to sink into oblivion. On the evening mentioned, all the fishermen in the village gather at a given point for the construction of the Clavie. At the present day this consists of a small barrel, which is cut into halves, one of which is filled with

wood and pitch. It is then fixed to a pole five or six feet long. The fixing must be performed with a stone, no metal hammer being allowed. When this is done, the pitch is fired by introducing a piece of burning peat. Coal dare not be used. When the flames arise, one of the fishermen seizes the Clavie and rushes along one street, followed by the entire male population, at the end of which he is relieved by another fisherman. In this way every street in the village is gone through, the Clavie being replenished from time to time. When the procession has passed through the village, the Clavie is deposited on the top of a little mound called 'the Doorie,' and there it is kept burning far into the night. It is then broken and the embers scattered. The people rush upon the pieces, and every fragment is carefully gathered up. Each individual secures a part; and so the ceremony ends.

Some years ago every boat in the harbour was visited by the Clavie-bearer, the intention being to purify and purge them from evil spirits, and especially from the baleful influence of witchcraft. The fragments gathered by the people are for the same purpose, and they are stored away during the year. Several rules connected with the ceremony have to be rigidly observed; for example, no landsman can take part in the programme under pain of death. Indeed, strange fishermen are looked upon with suspicion, and not allowed to participate in the ceremony. Sixty years ago, a colony of fishermen from Campbelltown (Inverness-shire) settled in Burghhead. After a few years' residence they were allowed to accompany the procession. The strangers grew and multiplied until they became as numerous as the original Burghheaders. Feeling their strength, they conceived the idea that it would be more in order with the fitness of things if the Clavie was burned on the evening of the 31st of December instead of the 11th of January. The innovation was fiercely resisted, and after a protracted struggle, the strangers had to succumb. A strange superstition connected with the ceremony is, that should any one fall in the rush along the streets it is a sure sign that that person will never be present at another Clavie-burning. So sure are they of this, that should the Clavie-bearer for the time fall, another at once seizes the fiery mass; and without waiting for the fallen man to rise, the crowd rushes onward, probably trampling him under foot.

This remnant of paganism, now slowly dying out in the lone village of Burghhead, was once common throughout Scotland. Some say that it is of Scandinavian origin; and others, that it is purely Celtic. There is no authority for either statement. The ceremony was probably performed by both races. It is certain that in the beginning of last century the kirk-session of Inveravon forbade the 'heathenish custom,' and took steps to put it down. A minute to that effect is recorded in the session books. Inveravon is a parish in the Highlands of Wiltshire where probably the foot of Norseman never trod, thus showing that the ceremony was practised by the Highlanders. To argue either side would be vain. What is of greater importance is that the mysterious rite is probably of much greater antiquity than is generally supposed. It is believed that it was originated for the purpose of frightening witches. No doubt

the belief in it among the fishermen degenerated into something like that; but the origin of the Clavie lies deeper. The use of a stone hammer instead of an iron one in constructing the Clavie, is by some held as indicating that the ceremony was in existence in the Stone Age. The Clavie, in short, appears to be the remnant of a religious belief, and is probably connected with fire-worship.

The unique mark of civilisation alluded to above, is a large cavity cut in the solid rock and known as the Roman Well. The cavity is about eighteen feet square. There is a platform three feet wide all round the well, and the remainder of the space is filled with water. The apartment is lofty, and it is neatly vaulted over with masonry. A stairway cut in the rock leads down to the platform, from which one can descend into the deep dark pool. Several antiquarian wars have been fought over this well; but no satisfactory conclusion has ever been arrived at. Burghhead is altogether a mysterious place. It is a veritable 'place of skulls.' A large ridge runs for a considerable distance between the village and the sea, composed mainly of human bones. When the wind is high and the firth is lashed into foam, it is alleged that these bones have been heard to rattle, and mysterious groans and deep mutterings to proceed from the mound. To the east of the storm-swept headland, the sea is gradually retreating; while immediately to the west of it the waters roll over a buried forest. Five strange sculptured stones, unique in Britain, have been discovered during the past fifty years on the headland. Each of them represents a bull. They are sculptured in the fine siliceous sandstone of the district, which is more enduring than marble or granite. The lines are strong and beautiful, showing that the sculptor had a high idea of art. Like the Clavie, these stones are a mystery, and belong to a far-past time. They, too, may be a remnant of paganism.

A CLUB STORY.

THE talk in the smoking-room at Holthorp last Christmas Eve ran wild and brilliantly for a while, then suddenly ceased. Everybody became so silent that the melancholy moaning of the wind round the house and down the wide chimney seemed to be finding its echo in some of our breasts, judging by the solemnity with which cigar or pipe was puffed. The cheeriest face amongst us was, as usual, poor Billy Fane's. At no time would you ever suppose he could not see you as he turns his eyes straight upon yours. Presently, as he looked round quickly, saying, 'Come, wake up, you fellows—don't go to sleep,' you would have thought he was taking a survey of the whole company. 'Hang it all!' he continued, 'don't condemn me to silence as well as darkness. One would think you were in training for a deaf and dumb asylum.'

'Well,' says Collistoun, a distinguished landscape painter, 'we shall be very deaf indeed when we cannot hear your voice, Billy. If your eyes were only as good as your lungs, you'd get on, wouldn't you?'

'Yes, indeed; I'm all right there,' answers

Fane. 'If I could only see whether there was room, I could wheel a battalion of the artists' corps into line as well as the colonel yonder; or paint you a golden harvest picture equal to our Colliston here.—But please go on talking; don't waste the fleeting hours by sitting mum-chance all the evening. Drop politics, and talk about art or the musical glasses—anything.'

This little rally set tongues wagging again, and two or three of the men present began in an undertone questioning whether it was worse to be blind or deaf. Then, after a minute, Sir Joseph, our host, delicately broached the subject to Fane, asking him which he considered the worse.

'I hope you don't mind, Billy,' he went on, 'but you should be an authority. Would you rather be as you are, or deaf?'

'Ah! I can't say,' was the reply. 'I know it is pretty awkward sometimes to be blind; but it is so old a story with me, I don't think much about it now. On the whole, though, I fancy I'd rather live in darkness than in silence; but then, as I say, I'm used to the one, and you fellows seemed inclined to give me a dose of the other.'

'Pretty awkward to be blind,' mused Sir Joseph. 'Yes, by Jove! I should think it was. That's a very mild way of putting it. I say, Fane, would you mind telling us the worst time you ever had of it throughout your affliction? I mean, when did it give you the greatest—I mean, when did it put you in the greatest fix apart from the general trouble of it? I suppose you have read *Called Back*? You were never in such a corner, for instance, as that fellow found himself in, I hope? You were never present at a murder, were you?'

'No; not quite so bad as that,' answered the blind man. 'But I was once in a very terrible scrape. Some of you might have heard of it at the time, if you were not all so inconveniently young; it is nearly twenty years ago now.'

'Indeed! What, through not being able to see your way about?' asked the host. 'Where did it happen? I never heard of it; but then, to be sure, we have not known you twenty years.'

'No, of course not. There were none of you born then, perhaps!'

A hearty laugh ran round the little assembly at this sally; and presently, in compliance with the general desire, Fane agreed to tell his story.

Sir Joseph Winch's acquaintance was like Sam Weller's knowledge of London, curious and varied. He delighted, especially at Christmas-time, to gather round him all sorts and conditions of men—bohemian, aristocratic, political, artistic, commercial, and scientific. But these details concern us not; this is but the record of an experience told by Fane, and which served to make that particular evening the most notable and amusing spent by Sir Joseph Winch's guests during their winter visit. They now eagerly settled down to listen to their blind friend, who, after a few preliminary words, thus began:

Remember, twenty years ago my loss of sight was of recent date, and although I was growing accustomed to it, and making the best of it even then, I had not abandoned hope, and was still under treatment. People say I am naturally

dodgy in my ways, and so I suppose I contrived to get about rooms and staircases, when I once knew them, more readily than many fellows would have done. At any rate I was as much at home at our little club, 'The Wits,' as in my own rooms, and could go up and down stairs and find my way all over the house without assistance. Not so, however, in the streets or strange places; and therefore I always have a young lad in my service as guide and escort, who fetches me, and, as I might say, carries me hither and thither! Friends have always been very kind and civil in asking me to dine and join in many a little social gathering. Now, I had been to one of these on the evening in question, and it was arranged that my host should drop me at the club, where the lad had been ordered to meet me and take me home.

A little before midnight, therefore, on—yes, it was on a Christmas Eve, just nineteen years ago, as I think, this very night, we reached the club. Snow had been falling the whole evening; and when we entered the hall, I congratulated my friend that he had no farther to go with me on such a miserable night; it was well we had made the arrangement. He, too, was glad his escort duty was over, and bade me good-night on the threshold.

'My lad has not come yet, I suppose?' said I to the porter. 'It has not struck twelve, I think?'

'No, sir; it wants ten minutes.'

'Then I will go up-stairs and wait,' said I, taking off my topcoat. 'Let me know when I am fetched.—Who is in the club?'

'Very few, sir; no one, indeed, but Mr Gridlay.'

I paused, as the man put my hand on the balustrade, the only guide I wanted to find my way up-stairs.—'Oh, which room is he in, do you know?'

'Back drawing-room, sir, I think. The waiter has lately taken him up a cup of coffee.'

'Good,' I thought to myself, as I ascended the stairs. 'Then I will go into the front room.'

Now, here, I must just tell you — Fane paused; then, after seeming to make up his mind, resumed: Well, I need not go into details; but this man Gridlay had played me a scurvy trick some year or so before—a trick which changed the whole current of my life. I need not say it was in the matter of a love affair. Briefly, just before I lost my sight I was engaged to be married; but of course when there was every likelihood of my never again being able to put brush to canvas, I was bound to release the young lady; but she would not hear of it, though her father hesitated. She was still prepared to share my lot. We should have enough to live comfortably on, though at a very reduced figure from what it would have been had I been able to pursue my profession. The old gentleman would have given way—was giving way.

The affair hung in the balance, when this Mr Albert Gridlay turned the scale against me. He was intimate with the family, and it appeared had secretly nourished a strong affection for my fiancée. So, what does the fellow do when he hears of my misfortune, and, as he declared, of the consequent breaking off of the engagement, but speak to the father on his own behalf, and

without saying a word to the girl herself. He was a rich man compared with me, and it would have been a far better match from that point. His proposal, I say, turned the scale against me. The old gentleman insisted on breaking off our engagement—did break it off; but I am happy to say the young lady never married Gridlay, although for a long time her family moved heaven and earth to induce her to do so.

Gridlay and I had a slight acquaintance, with each other, and assuredly neither liked the other. He was a horsey, sporting sort of gentleman—not my style of man at all; but he was a member of my club; and after his conduct, and when I knew he was still prosecuting his suit, I cut him dead, though cutting a fellow is not easy for a blind man. However, about a fortnight before this eventful Christmas Eve we were accidentally thrown together in the club, and I could not avoid him. He made some insolent allusion to the probable reason for my not speaking to him; and being a peppery fellow, I unwisely took it up, and, contrary to my custom, had an open and angry quarrel with him—about the only one I have ever had with anybody in my life. Some high words passed, and at last I said: 'You take advantage of my infirmity, sir. You would not have dared to have said that if we had been on equal terms, because, you know, if you had, I should have knocked you down.'

He replied with renewed insolence; and I don't know what might have happened, had not some one interfered and pacifically led me out of the room; but I was very angry, threatened to bring the matter before the Committee, and in my irritation said many things perhaps I ought not to have said.

Thus you can understand, with this dispute still clouding the atmosphere, why I should avoid the room in which the porter said Mr Gridlay was sitting; and so I went into the front drawing-room. All was silent as I paused and listened for a moment at the door. I could have sworn no one was in the room. Knowing the ropes, as the sailors say, I felt my way to my favourite corner on a long couch at the opposite side to the fireplace. Sitting down gladly, for I was tired after my tramp through the snow, to wait till I should be fetched, I presently began to doze, and in a little while fell fast asleep, it is to be supposed for more than an hour. Awakening at last, and feeling very cold and a little dazed, I stood up, and was feeling my way by the edge of the couch towards the fireplace, when I suddenly kicked against the feet and legs of some one sitting at the farther end of the seat.

'I beg your pardon,' I cried; but there was no response, and the legs were not removed. 'I hope I did not hurt you?' I continued. 'I did not know any one was sitting there.'

Still no response; still no movement of the obstructing feet.

Gently stretching forward, my fingers fell upon a drawn-up and contorted knee, and close to it an ice-cold hand clenched and rigid. Then I gently shook the sitter by the shoulder; still he did not move; his body, too, seemed rigid, and curiously bent backwards. Growing alarmed, I pressed my hand swiftly up to his face and forehead; the latter also was like a block of ice.

'Good God!' I cried, 'the man is dead!' In a paroxysm of dismay, I fumbled and stumbled my way to the bell and rang it violently.

Before I had time to return to the couch, the waiter was in the room.

'See, waiter! who is that on the couch? I am afraid he is very ill, if not dead.'

'Dead, sir—never!' exclaimed the man.—'Why, it's Mr Gridlay. I brought him his coffee about an hour before I saw you come into the club, sir; he was then in the back room. Here is his cup, nearly empty, beside him on the table.—What had I better do, sir?'

'Do? Why, rouse the house; send for a doctor, quick.'

But poor Gridlay was beyond the reach of doctors; the united skill of the whole College of Physicians could have availed him nothing.

I cannot pretend to narrate in detail what followed. The commotion, be sure, was terrible. A doctor was soon on the spot. The dead man's friends were communicated with; his elder brother arrived, bringing a second doctor with him, and then the police were informed; I, standing by bewildered, helpless, and incapable, telling my story over and over again, and answering a dozen questions a minute. Finally, the body was removed; and, as my lad had failed me, I was taken home by a waiter, but not before one of the doctors had given it as his opinion that death was caused by poison—strychnine, he suspected, from the dregs in the coffee cup and the contorted position of the corpse. There would have to be an inquest.

And in two days' time an inquest was held, at which, of course, my evidence was essential. The post-mortem confirmed the doctor's suspicion: strychnine was the cause of death, the remains of the coffee proving it had been swallowed in that. But how did deceased come by the drug? There all was doubt and mystery. The inquest was adjourned. At the next inquiry I was recalled, and subjected to a rigid and most unpleasant cross-examination. Said the coroner, or the lawyer who appeared to watch the case on behalf of the deceased's relatives—'I am not sure which, for, remember, I was wholly unconscious of the aspect of the court and of the relative positions of the people in it—said somebody, therefore: 'Now, you see, Mr Fane, we are unable to discover how or by what means the unfortunate gentleman came to have poison in his cup. He was not known to have any strychnine in his possession, and there is no evidence to show that he ever purchased any: no bottle or phial has come to light. The question, therefore, naturally arises, how came there to be strychnine in that coffee cup? You are blind, suffering, I believe, from atrophy of the optic nerve, and are, as I am informed, under medical treatment for the malady—you are taking medicine. Now, do you happen to know what the principal ingredient of that medicine is?'

I paused; for I did happen to know—it was strychnine, and I did not like the question. It was repeated.

Then I replied promptly: 'Strychnine, I believe; and I am obliged to have something of the kind injected into my arm periodically.'

'Exactly so,' continued my interrogator. 'It is the ordinary drug used in such cases. But you

also take a certain proportion of it with y^{our} food, do you not?' 'Yes.'

'And had you not the little bottle containing it in your pocket at the time you were sitting on the couch, alongside the deceased, you two being entirely alone in the room of your club?' 'Certainly,' I exclaimed in some agitation, for I now clearly saw to what a dreadful suspicion these questions pointed. 'But you don't mean to imply,' I continued hastily—

'Be kind enough to answer my question; confine yourself to that, please; and let me further ask: had you not quite recently had a very angry quarrel with the late Mr Albert Gridlay? Was there not great animosity existing between you previously? Were you not deadly rivals, so to speak?' 'What could I answer? And as I answered I felt the full force of the situation, and though I was comparatively young in those days, I knew that it might go hard with me, as it had done with many a better man, ere I could clear myself of the frightful imputation—ere I could break down the case that was building up against me. Had any legal adviser been at hand, he would probably have cautioned me at the outset of this string of inquiries, and have told me I was not bound to answer them. As it was, the admission was made and the mischief done.

However, no more questions were put to me then; I was led from the witness box, and the coroner very soon proceeded to comment on the evidence. He touched slightly but significantly on mine—sufficiently to greatly add to my growing uneasiness. He asked the jury if they would like a further adjournment of the case, or whether they thought there was sufficient evidence before them to enable them to arrive at a verdict. They thought there was not; for although no doubt existed as to the cause of death, it was desirable that the matter should be further sifted, and another effort made to discover how strychnine had found its way into the deceased's coffee—evidently a direct allusion to the fact that I had strychnine in my possession at the time we were sitting alone almost side by side in the club. The consequence, of course, was a further adjournment.

Need I say that during that time I went through an agony of suspense? A dark suspense it might truly be called, which was not a little added to by the information which reached me that Gridlay's brother intended to subpoena the witnesses of my quarrel with deceased at the club, with a view of getting a verdict of wilful murder against me by the coroner's jury.

Here the blind story-teller paused, and turning his face from one side to the other, you would have supposed he was looking at us, for his eyes seemed to twinkle knowingly. Then he said: 'There, gentlemen—that was my fix, and a pretty awkward one, you will admit.—But I was not hanged,' he went on with a comical smile playing about his lips, 'as you see, for, happily, by dint of inquiries, good legal advice, and a clever detective, we were enabled to prove that Mr Albert Gridlay had obtained strychnine pills or boluses from a veterinary surgeon in the neighbourhood of Newcastle with the ostensible purpose

of physicking a horse. We were able to bring evidence of this into court on the occasion of the adjourned inquest, the result being a verdict of suicide whilst of unsound mind.'

'Pretty awkward to be blind—yes, truly!' said Sir Joseph Winch. 'One need not be suspected of murder, however, to convince us of that;' and his opinion was echoed unanimously by his guests as they broke up for the night.

THE DRAMATIC INSTINCT.

THERE are many people who are neither dramatists nor novelists by profession, but who yet have such a keen eye for 'effect' that they may be said to be both. Like farce-writers, such people are quick to see a 'situation,' and if necessary, to make one, in order to indulge in a little cheap theatrical display. It would not be difficult to show that almost every man of genius of poetic temperament has indulged more or less in this propensity; in many cases, doubtless, without intending any harm by the simulation or untruthfulness. Some one ventured to remind Alexandre Dumas that an anecdote he had just related was not strictly in accordance with the truth. 'No,' he said frankly, 'it was not, I know; but the story was ever so much better as I told it.' The same desire has influenced, and will influence, thousands of persons in embellishing a story. Being a novelist, Dumas may perhaps be excused for giving play to his imagination for the sake of heightening 'effect;' and the same excuse could be urged in favour of those novelists who, in recording their 'personal experiences,' hardly ever allow one to lose sight of the fact that they are story-tellers by profession. So much of their time is spent in contriving situations, that it is not at all surprising that they are often tempted to stray from the paths of absolute truthfulness.

The general public, however, has no such excuse. Yet so keen is the dramatic instinct with many people, that they contrive 'situations' with a fertility of resource that would make many novelists wild with envy. But the dramatic instinct is mostly displayed in the telling of stories, in connection with which 'truth is,' no doubt, 'a sad hamperer of genius,' because it is comparatively rare in real life that experiences fit in with preconceived notions. These—whether owing to innate ideas or from a loving study of fiction—is more than need be determined—are frequently romantic in the extreme. Fitz-Boodle confessed that in all the comedies and romances he had read the hero had always a go-between—a valet or humble follower—who performed the intrigue of the piece; and consequently he selected some subordinate to carry his letters to Minna Löwe, notwithstanding that he might easily have given her them himself. There may be a good deal underlying this little bit of satire.

A familiar story is told of a soldier who, bearing a reprieve for a companion, rode at headlong speed until he neared the camp, and then he drew rein and waited until the firing-party began to turn out. Being reproached by a comrade, who asked him why he did not ride on, and so relieve the condemned man's feelings, he indignantly

nantly exclaimed: 'What! would you have me spoil all the dramatic effect?' Doubtless, in all the cases he had ever heard of, the reprieve came just as the execution was about to take place. Few, perhaps, have the dramatic instinct so finely developed as in this apocryphal soldier; but the quality is by no means rare, especially among young men of poetic temperament. 'The English artist,' says Lytton, 'generally commences with rapture and historical composition, to conclude with avaricious calculations and portraits of Aklerman Simpkins.' Nearly every young man, it is true, commences with poetry and ends with prose; and as a rule, the dramatic qualities wear off with increase of age.

But there are exceptions. Rogers the banker-poet was always a man of great artistic feeling; and in *The Early Days of Samuel Rogers* a story is told that fully shows that in his regard for dramatic effect he was not hampered by the truth. According to Mr Clayden, Leslie the artist said that when he and his daughters were at Brighton, Rogers took them in his carriage to the Dyke. 'As we sat in his carriage,' Leslie proceeds, 'looking over the vast expanse of country below us, he pointed down to a village that seemed all peace and beauty in the tranquil sunset. "Do you see," he said, "those three large tombstones close to the tower of the church? My father, my mother, and my grandfather are buried there." Leslie told Mr Philip Gilbert Hamerton the anecdote himself, and imitated Rogers's tone of voice, which he says was most pathetic. On hearing the story, somebody exclaimed: 'What a lying old rascal!'—the truth being that the poet had not a single relative in that churchyard. Rogers afterwards confessed that the only foundation for what he had said was that he would have liked to be buried there himself. A proceeding such as this can only be classed among those lies as to the absolute sinfulness of which theologians cannot agree, since there can be no doubt that Rogers solely aimed at heightening effect. He was, in short, 'theatrical,' a charge which, as every student of elocution knows, awakened what Dickens would call the 'liveliest feelings' in the breast of Pitt.

Whether that heaven-born minister was theatrical may perhaps be open to question; but there can be no doubt that there have been many 'stagey' scenes in the House of Commons, the famous dagger incident doubtless being among the best known. There, however, a certain amount of theatrical effect is calculated and allowed for—a great deal may indeed be conceded to orators under any circumstances; but occasionally the border-line between the embellishments of rhetoric and the tinsel of theatricalism is over-stepped, and the result, effective though it may be for the moment, is not calculated to enhance the reputation of those who indulge in such resources.

Counsel in law cases, as we all know, have, as a rule, the dramatic qualities very strongly developed. A short time ago one of these gentlemen received a nasty rap over the knuckles. Posing in a very fine attitude and bursting with eloquence, a certain Q.C. was addressing the jury, when the judge, interrupting him, said: 'I must request you to change your demeanour.' The counsel stammered out: 'I was not aware, your lordship'— 'Oh, probably it was quite uncon-

scious,' interposed the judge; 'but do be on your guard. It is most troublesome that there should be any dramatic performance going on!'

In private life the love of 'effect' is generally pernicious. Everybody remembers that the immortal Pecksniff always contrived to inform his daughters of the coming of any visitors, in order that they might be found suitably employed; and everybody remembers, moreover, that those charming girls were greatly surprised and blushed furiously when the visitors arrived. Somewhat analogous to this little piece of dissimulation is a story which is going the rounds of the American press. One of the most popular of American authoresses has five sons, of whom she is exceedingly proud. When a visitor is announced, it is her invariable custom, according to the story, to direct her sons in what position to place themselves, so that the visitor when entering the room may get a brief glimpse of a pleasing family group. This may be due to mere harmless vanity, although the profession of the lady is strongly against such a supposition. At any rate, the harm in cases of this sort is not great, nor can any objection be taken to

That vivacious versatility,
Which many people take for want of heart.
They err—'tis merely what is called mobility,
A thing of temperament, and not of art,
Though seeming so from its supposed facility;
And false, though true; for surely they're sincerest
Who are strongly acted on by what is nearest.

This makes your actors, artists, and romancers,
Heroes sometimes, though seldom—sages never;
But speakers, bards, diplomatists, and dancers,
Little that's great, but much of what is clever.

In private life especially, the love of 'effect' tends to bring about an artificiality of manner and of life that cannot but be injurious.

REAL PRESENCE.

In the heart of the city that's proud and gay,
A child stood begging one summer day.

The world went by; but it took no heed,
For the world has never a heart to bleed

For the woes of others: it passed along,
And the child was alone in the hurrying throng.

It lingered there in the summer day
Till another beggar came by that way,

Whose soul was sick with the whirl and strife
Of the mystic something which men call Life.

He looked at the child: at its side he stopped,
And into its hand his last penny he dropped;

Then he passed along with a half-breathed sigh,
And said, 'He wanted it more than I'

And in him as he passed my heart adored
The living presence of Christ the Lord!

HOLIDAYS FOR POOR CHILDREN.

AN age of discoveries ours may well be called, and possibly in consequence of the eager strained life which is always on the lookout for novelty, a very old truth has come to be so fully recognised as to be almost new. Indeed, the saying of our nursery days, 'All work and no play makes Jack a dull boy,' has become such a living reality, that during the summer months one has only to turn into any large railway station to be convinced of the fact that dwellers in cities at least are full believers in the need and blessedness of a real holiday. The eager faces of the children, the comfortable consciousness on the part of Paterfamilias that business is to give way to pleasure, even the hurry and bustle and incessant 'By your leave,' are so suggestive of preparations for happiness, that we quite understood the sympathetic remark of a porter, not too harassed to smile: 'Looks like holidays, don't it!'

But yet another old truth has, happily for our generation, also come to be more fully understood, and there is perhaps no more cheering sign of the times than the growing sense amongst the well-to-do that no pleasure can be complete unless shared with their poorer brethren. In the matter of holidays, very practical expression of this growth of higher feeling is to be found in the formation of country holiday schemes in many large towns, and most noticeably in the huge brick-and-mortar wilderness of London. Amongst its thousands of dreary streets, the holidays may mean a blessed rest to overworked teachers; but to scholars and their parents they have a meaning the reverse of blessed. 'I wish,' said a friend the other day, 'that all the boys in this neighbourhood could be sent away—anywhere—for the holidays;' a wish that would certainly be echoed by the host of young Philistines let loose into the streets with no better employment than to 'loaf,' tease, quarrel, and shout.

To the weakly and ailing, those too listless to join in the rougher games or plays, the holiday-time is even more sad. Sometimes, certainly,

there is enough to do and to spare, and 'mother' rejoices to get rid of 'baby,' whose teething troubles are to be comforted by the little old woman, who herself needs the petting and soothing that in richer homes would be hers by right of her years and weakness. But even in those rare and happy intervals when there does not happen to be a baby, the lot of the delicate child, not wanted in the one-roomed house, and with no refuge but the hot and noisy streets, is one to make an angel weep. Those of us who are familiar with the poorer parts of London know only too well the listless look of the little sufferer from chronic debility (that is, want of air and food), whose heavy head has no softer pillow than a doorstep, and whose pale pinched face is so utterly unsuggestive of childhood's roses and roundness.

Those whose lives lie apart from sights of sadness can hardly grasp the poverty, in every sense, of the up-bringing of many thousands of little ones; but it is scarcely possible to exaggerate the barren surroundings which envelop a large majority of the six hundred thousand children attending London elementary schools. It is therefore little wonder that the scheme of sending some of the most needy for a fortnight of real holiday-life in the country has proved an unmistakable success. Starting some fourteen years ago in an East End parish, the work has grown so rapidly that after four years of corporate life the Children's Country Holidays Fund was able to send away during last summer no fewer than *fourteen thousand and forty-eight children*. And if the seeing-off a trainful of ordinary travellers is a pleasant sight, what shall be said of those groups which are becoming quite a feature in booking-clerks' work? Here is one of these groups waiting for the lady who will take the tickets, at the reduced rate given by most of the Companies. Pale-faced mothers and children, happy though, and eager; very careful of the luggage, done up in awkward bundles with too little paper and less string. 'Be sure you're good,' and 'Let us know how you gets on,' are the maternal exhortations, to which the children are too excited to listen. 'Ah! we didn't have

such treats when we was children,' says one mother whose hands tell a tale of hard work to find bread, let alone 'treats,' and whose face has relaxed from its habitual grimness at sight of her little girl's absorbed delight.

'And how old are you?' we ask of an anxious elder sister who is mothering a small brother too young to go with her. 'Thirteen' is the grave reply. Thirteen! Poor little soul, with a face that would be too old for thirty. Never mind! A fortnight in the country will send Annie back a child again, with a store of tales to brighten many a dull day. Next to Annie stands a great boy of eleven, 'crammed' through the Sixth Standard, but so much the worse for the process that without a real holiday his overgrown powers would not stand the work of a 'little place' so eagerly welcomed by his widowed mother. The eldest of the party, just under fourteen, would be small for ten, and has spent much of her life between the out-patients' department of a children's hospital and her mother's laundry, the benefit of one being pretty well neutralised by the other. 'How often have you been in the country?' we ask.—'Me! Why, *never*,' is the surprised reply. 'I ain't never had a chance before;' the truth of which is borne out by her intense surprise at the 'real green' of trees 'not in the parks.'

The children's ideas of the country are somewhat curious. One young critic remarked, on getting out at a wayside station: 'I don't call this country. Why, there ain't no swings nor roundabouts!' Another little Londoner being asked what she understood by a sunny bank, replied: 'A place to put pennies in on the 'ot side the road!' Many are struck by the 'big sky' and by the astonishing fact that potatoes and fruit are to be got elsewhere than at 'the shop,' whilst the first sight of a pig has been known to produce a difference of opinion, one boy holding the unfamiliar friend to be a 'little sheep,' and being quickly put to rights by the superior remark: 'No, 'taint 'tis a nanny-goat!'

Still more surprising to some are the home arrangements of the cottages in which they are boarded. One boy was quite overcome by the idea of a separate room to sleep in; and two little girls complained of being 'lonesome' with so much 'room' in the bed! Some of the elder children notice, and are deeply impressed by the tone that pervades the country home. 'They never quarrel here,' writes one girl; whilst 'no rows,' even on Saturday night, is quite a novelty in the experience of not a few young lives.

The cottagers, on their side, learn something from their young guests; the unconscious prattle of the children, for instance, shows that London is not by any means paved with gold, and their stories reveal that the struggle for existence is a thing too fierce to be contemplated with pleasure by the slower country mind. The friendships, too, that spring up on both sides are very real, and tend to lessen the breach between town and country, which is productive of harm to our English life all round. The cottagers chosen to act as hosts are those in good work, and the weekly five shillings paid for each child is found ample to pay expenses, whilst it prevents the question of 'gain coming too much to the fore. Cottages are invariably under the supervision of some responsible visitor, who sees to the arrival

and departure of each party, pays the cottagers—with money received from the Central—and keeps a general outlook over hosts and guests. Of such visitors there are nearly four hundred, and the devotion of many is beyond words. More than one known to us gives some hours each day to the little Londoners, getting to know each one, and carrying on a subsequent correspondence that keeps cottage 'Father' and 'Mother' in touch with their adopted children.

The country visitors are also in close communication with the army of town-workers, whose care it is to select children, to collect parents' payments, and to see parties safely on their way. The town-workers are expected to visit their country friends during the season, getting to know both visitors and cottagers, and enjoying the sight of the happiness they have helped to create. Their work is heavy, especially in neighbourhoods almost entirely populated by the poor; but in banding together as committees, hands are strengthened, and work made lighter by organised effort.

Children are selected on the grounds of their being ailing, having no friends they can visit, and not being in a position to obtain a holiday unaided. There is the further condition that parents shall do their share towards providing a holiday by making some contribution according to their means. We have often had occasion to draw attention to the lavish and indiscriminate abuse of charitable funds, and perhaps hardly any better indication of the truth as to that much- vexed question of free-hospital relief can be found than in the fact that from the very class who help to swell out-patients' departments no less than £2819, 16s. 11d. was collected last year. The gratitude of the parents is very real, and we cannot help thinking is due in no small degree to the fact that the benefit to their children comes in part from their own exertions. It is also impressed upon parents that their contributions help to send other people's children; and it is pleasant to hear a hard-working father or mother say: 'If it's to help some one else's child I'd like to give a little more.' Indeed, the spirit of love and good-will evoked on all sides is by no means the least pleasant feature in the scheme; and the guards, who without 'tips' look after holiday children as their own, are typical of a general feeling of brotherhood and friendliness.

Uniformity of action among the eight hundred voluntary workers is secured by means of a representative Central Council, who decide all questions of general principle, and take upon themselves the weighty duty of the distribution of funds. It is an invariable rule that all contributions shall be paid into one common fund, money being divided out according to the specific needs of each Committee. In order that this shall be accomplished with fairness, it is necessary to ascertain the exact number of children attending schools within the areas of each Committee, together with the fees paid; and week by week, during the summer months, an Executive Committee meets to distribute funds according to the population of each district and the number of children ready to go.

It will easily be seen that to keep such a large machinery working economically and in order calls for much thoughtful care and business capacity on the part of the office staff. As yet

the work of the Society has been managed with remarkable economy. The balance-sheet shows that the funds for the year amounted to £9430, and that the sum paid for official work was only £198, 13s. 8d., or something like two per cent. of the income. There is no doubt a standing complaint on the part of the public with regard to the cost of distributing funds collected for charitable and other purposes, and economy in this department is always commendable. At the same time economy should not be pressed too far. We would venture to suggest, for instance, that this particular Society might expend a reasonable sum in making its existence and objects better known. It is undoubtedly a work that needs only to be known to be supported. It appeals to the sympathies of all, and there are few who would not enjoy their own and their children's holidays the better for knowing that they were helping the less favoured to a fortnight of country bliss.

The applications last season were far in excess of any previous year, in spite of bad weather. Literally, thousands of children were kept waiting in the hope that money might come in before the school holidays were over, and the only unpleasant feature in the work is the disappointed faces which greet the London workers when lack of funds compels refusals. All child-lovers may have the joy of knowing that they are brightening young lives by sending a contribution to the Hon. Alfred Lyttelton, at the offices of the fund, 10 Buckingham Street, Strand; and we have only to add, that by the careful methods employed, the Society is able to state that even with the full increase of expenses suggested, every ten shillings will pay for a fortnight's holiday, and fill the heart of one little Londoner with joy of the purest and simplest.

JOHN VALE'S GUARDIAN.

CHAPTER XIV.

It had been the unfulfilled dream of Mr Orme's lifetime—a sort of hope too good to be true, too good even to be practically sought for—to find somebody who would do his work for him and allow him to draw his pay. He was not a man of strong passions, but he hated work and loved rum. Rum was only to be had, along with the other palliatives of existence, by labour, and Mr Orme felt that his lot was pitiable. But before Will had been a week in the printing office, the veteran skulker began to think that the dream of his lifetime might find something like a fulfilment in his old age. Will was so quick and eager to learn, took such a pride in every forward step he made, and found such an actual pleasure in work, that Mr Orme looked forward with complacency to a time when he would have nothing to do but to sit upon his box at the side of the stove and give directions. Will, without altogether accepting Mr Orme's declaration that a selfish man would have done the work himself, was yet grateful for the instruction he received. There was a battered little book on the premises called the Printer's Grammar, from which he

learned enough to persuade him that Mr Orme's method of management was in some respects faulty. It would have taken half-a-dozen skilled workmen a week to have put the ramshackle little place in good order; but Will, inspired by the Printer's Grammar and a sense of personal pride, worked so hard and learned so rapidly that in a month or two he attacked the fringes of the desert of disorder, and conquered here and there a square foot of chaos. In one of his earliest readings in the Grammar he learned that the most hateful thing about a printing office, the one ever-greatingen dragon to be relentlessly fought with, was called 'pie.'

'What's pie, Mr Orme?' he asked, as he and his preceptor walked homewards together.

Mr Orme explained that pie was made up of type which had been suffered to fall into disorder; and Will saw at once that the dragon had been allowed to assume formidable proportions. At a moderate computation, a fourth of the office plant lay useless; and Master Will, who was one of those people who can do nothing with satisfaction to themselves unless they do it with their whole hearts, determined early to slay that dragon. It was this resolution on his part which dissipated the half-formed visions of Mr Orme. It was about the middle of July, and the weather was prodigiously hot and oppressive. The aged idler felt even less disposed to work than usual, and even his perch upon the box, though padded with a folded press blanket, was so little luxurious that idleness afforded him no comfort.

'William,' he said, 'you're getting on very nicely, and in time you'll make a very good workman; but it's time you began to think about display-work. Now, I've never let you tackle display-work yet; but here's a bit of a circular that the governor's rather particular about. Let me see you have a try at it, and I'll help you with a bit of advice when you want it.' This was spoken with great friendliness, and with an almost deceptive air of conferring a favour upon William.

But to Mr Orme's astonishment and grief the boy declined to accept the kindness. 'I'm going to kill this dragon, Mr Orme,' said Will; 'I'm going to get this pie under. I can never do it if I do your work for you.'

This black ingratitude so struck Mr Orme that he was silent for a quarter of an hour, and rising with moans of resignation, he shuffled listlessly about the place, carrying his box with him, and seating himself at intervals whilst he picked languidly amongst the fancy types.

This was his second disappointment; for, a month or two before it, Will, whose supply of money had been exhausted in the purchase of a cheap suit of working clothes, had been unable to find the necessary moneypence for his medicine, and the poor sufferer had been compelled to rally by his own unaided natural forces. He had felt that first failure to be bitter at the moment, but

he knew now that it was not to be compared to the later affliction. William stuck resolutely to his pie, and was only to be drawn from it by legitimate claims. Mr Orme's dream was shattered, and he went back to the dull realities of life with something like a resigned heartbreak. Before six months were over, the boy was his master, and ordered him to his work relentlessly. The melancholy Varley never knew how it was that the work of the office came to be turned out so much more expeditiously than of old.

As he worked, Master Will sang and whistled with a shrill disregard of melancholy, and felt his heart as light as a bird's. His experiment was succeeding in a wonderful way, and John was changing for the better daily. It was curious, and not a little touching, to see the two lads together. Will had the gravest fatherly air, the queerest little tender bulldog ways of watchfulness and devotion. The two took long rambles together on Saturday afternoons in the beautiful Warwickshire country, and John always carried a scrap of paper or two and a pencil with him, and made strange wooden-legged sketches of the cattle in the fields, and funny lopsided drawings of old farmhouses. These M. Achille Jousserau was in the habit of correcting for him, and he did his corrections with so much skill and spirit, that after a dozen strokes from the master's hand, the drawings looked altogether beautiful and perfect to the pupil's eyes.

M. Jousserau and his friend and compatriot M. Vigne were both of the town of Arles, and each said of the other, 'Il est mon pays.' They nourished for each other that curiously strong friendship which exists between exiled Frenchmen of the same province, and makes them hoard together even in their common capital. The good phrase does not say, 'He is of my country,' 'He belongs to my country;' it is ever so much stronger and more tender: 'He is my country.' He brings its flavour with him; he means home, childhood, everything that knits a man to the memories of his native place.

M. Vigne was a solid, plodding, trustworthy draughtsman in an artistic glass manufactory, and Achille was an artist in the same employment. He was a trustworthy workman also; but there was a difference between them. The younger man had inventiveness, a passion for his work, and an ambition outside it and beyond it. The elder drew with a laborious painstaking and accuracy, but invented nothing, and had no ambitions, and the younger earned already five times his salary. But when they had met three or four years before, the heart of each had warmed to the old home accent. 'Tens, tu es un pays, toi!' they sang out together; and in ten minutes, with flashing gestures and exuberant enthusiasm of speech, had recounted half their family histories. So Achille went to live with M. Vigne, and helped out the meagre resources of his establishment more than a little.

Achille took John in hand quite seriously, and gave him lessons in drawing, by which he profited so much that in a while the wood got out of the legs of his cattle and into his pictured tree trunks, which was perhaps the best place for it. This kindness of the young artist's was very naturally and easily rewarded, for he began to pick up English as fast as a pigeon picks up peas, and even acquired a little of John's Barfield accent, at which Madame, whose ear was sufficiently habituated to detect it, would clap her hands and laugh with great merriment.

The good-hearted French folk lost nothing by befriending the two young wayfarers, for the boys earned enough to pay for their simple and unluxurious keep. John's pricking out of patterns saved M. Vigne many a weary and unprofitable hour, and enabled him to put his spare time to more paying uses, so that the family benefited rather more by the efforts of the weaker than of the stronger youngster.

'You don't have any of your headaches now, do you, Jack?' Will asked him one day. It was a Saturday half-holiday, and they were in the fields together, midway towards Stratford. It was a lovely afternoon, and made the brighter for both of them by John's unusual contentment. Achille had laid out a shilling for him in the purchase of a real sketch-book, and the two had tramped thus far in search of something worthy to be transferred to its first page. If he had had but his ordinary scraps of paper, John would have been firing his trial shots left and right; but he felt bound to find something unusual and charming for the beginning of the book. He looked round brightly at his companion's query, and answered with a shake of the head.

'I'll tell you what, though, Will,' he said, sliding an arm through one of his friend's, with a certain nestling way of seeking protection into which he had fallen, 'if anything bothers me to remember, I get that nasty swimming back again, just as if I had a wheel in my head—an enormous wheel. You wouldn't believe how big it is, Will. It's as big as a cart-wheel; and it begins quite slowly, and gets faster and gets bigger, till at last I don't know anything and can't think of anything. But when I get like that, Madame always makes me lie down, and I go to sleep almost directly. I should have headaches, though, and jolly bad ones too, Will, if old Macfarlane was here.'

'I guess you would,' his companion answered; 'but old Macfarlane ain't here.'

They walked on in silence for a little time.

'I say, Will,' said John, 'I should have been bad if it hadn't been for you. I used to be afraid that I was going silly; and if I'd stopped at old Macfarlane's, I believe I should have gone.'

'It wouldn't have been his fault if you hadn't,' Will answered, 'nor old Snelling's either. When I'm grown up, I mean to go back and take it out of old Macfarlane.'

This idea held firmly in Master Will's heathen mind, and indeed he never actually overgrew it until, in after-years, he discovered how very big he himself had grown, and how very small and gray Macfarlane was. But the story of that interview deserves to be told in its proper place.

'It's my belief,' Will added, 'that old Snelling

didn't want you to get better. I think I wanted to make you worse.

'What nonsense!' answered John. 'Why should he?'

'Ah!' said the young bulldog jeeringly, 'why should he? Why, father used to say—many a time I've heard him say it—how rich Bob Snelling would be if you never got any better and couldn't use your own money.—Do you think my father's as rich as yours was, Jack?'

'I don't know,' John answered. 'But if Uncle Robert really felt like that, he must be an awful horrid beast. I don't believe it, Will; I don't believe it.'

'I do,' said Will doggedly.

It was perhaps only the brutal, unquestioning frankness of a boy's mind that could very well have lighted anybody to this suspicion. A more elderly critic would have felt the terrible responsibility of the judgment; the cold and cruel enormity of the crime would have staggered the adult inquirer, and he would have sought and found a reason for Snelling's conduct in the crowded pages of the chapter of human stupidity. Yet the boy's horrible guess was true, and the elder observer's gentler judgment would have been mistaken.

'You must think your uncle Bob jolly thick-headed,' said Master Will, 'if you fancy he didn't know what he was doing. Any fool could see he was driving you silly. Of course he was, and old Macfarlane was helping him. I knew you'd get better when you got away from 'em, and how should I know, if they didn't?'

This conversation cast a gloom over John's spirits for a half-hour or so; but it rolled away of itself, and he settled down to his field-work with ardour, and took home a feebly pretty little sketch, which Achille touched into strength for him in places, and guided him into strengthening with his own hand in others.

'You will make an artiste, you,' said M. Jousserau, flashing his white teeth at his pupil, and beaming at him with his black southern eyes as he laid both hands upon his shoulders and gave him a shake expressive of friendliness and approval. 'You have not the hand. That is absurd—who could ask it? Not yet. That comes with work, work, work. Peep, peep, peep at everything, always, always, and is never done with. I am beginner. I shall be student when I am old, old man, gray, stooped all over'—He could not find the word he wanted, but ran his rapid fingers about his face to indicate wrinkles, and dropped into so comic an imitation of decrepitude that John answered his mimicry with a peal of laughter.

Though that was the first occasion on which Will insisted on Snelling's villainy in his companion's hearing, it was by no means the last, and every member of the little household was aware of his convictions and in a lesser or stronger degree shared them. It is quite likely that they might not have accepted his sole testimony, but they had Isaiah's to back it. When once Will had found himself fairly settled down under Mr Orme's tutelage, he had written to Isaiah, who had answered the letter in person on the following Sunday. Isaiah had a natural and excusable belief that French people—who represented all the foreign races of the world to him—were savage and heathen; and he was vastly surprised to

discover that on the whole they were really very much like English men and women in their ways of living and feeling. He and the stately M. Vigne were a great spectacle together. Monsieur handed him a chair with a bow on his first arrival; and not to be outdone in politeness, Isaiah bowed back again; and this exchange of civilities, which was the only one possible between them, since Monsieur knew no more of English than Isaiah did of French, was repeated with a comic frequency. Madame began to talk of it when the visitor had gone; and Will and John went through a grave mimicry of the scene, bowing to each other like a solemn pair of toy mandarins, until the good woman fell into one of her helpless fits of laughter.

After this, a month rarely went by without a Sunday visit from Isaiah, who learned to drink their southern wine without overmuch creasing his features, and to smoke the cigarettes rolled for him by one or other of his hosts. It got to be quite a common bit of comedy pantomime, when they were alone with Madame, for one of the boys silently to roll an imaginary cigarette, and then rising, proffer it with a profound bow to the other, who would rise and bow in turn. It was a simple form of amusement, but it never failed to elicit a laugh from that jolly, fat-sided Madame Vigne, who was, as we have seen already, of a nature readily moved to mirth.

Isaiah gave such an account of John's possessions that the good people became half-terrified at the responsibilities they had assumed; but John's improvement was so evident, so smooth and constant, they put their fears on one side, though they all had some dim dread of English law, and were hardly certain that they were not laying themselves open to some terrible, vague punishment.

Mr Orme was, of course, pretty frequently present at the time of Isaiah's visits; but since the latter had given it as his opinion that Snelling would give a hundred pounds to have John back again, and would certainly repeat his old methods with him, it was felt wise to keep the aged idler from details which might lead him into temptation. Madame could have no creature about her for whom she would not grow to have some kind of affection; but Mr Orme was looked upon with a sad indulgence, and was not particularly trusted. Perhaps it was natural in Mr Orme to resent this a little. Perhaps the dull mill-round of his own life was not sufficiently interesting to occupy his thoughts. Anyway, observing that conversations were broken off upon his entrance, and that there was an air of mystery preserved with respect to Isaiah's abiding-place, he began to be curious and to prawl about suspiciously in his own sloth-like way with intent to smell out the secret. He was good enough, on one occasion, to accompany Isaiah to the railway station; but that worthy had had Madame's advice beforehand, and paused so often on the way to shake hands with him in friendly adieu, that the old boy was compelled to take leave at last without even learning the direction taken by Isaiah's train.

He knew very well that the boys had run away from their homes, and their speech and manners were a sufficient guarantee that they had been decently bred. Will had unguardedly said something to the effect that John would be rich some

day; and though it is probable enough that Mr Orme would have attached no importance to this if the boy had persisted in the story, he did attach considerable importance to it when Will went suddenly silent, and steadfastly refused to be lured into a revival of the conversation. In fact, the whole household was on its guard against Mr Orme; and he, casting about in his own mind for a reason for this caution in respect to himself, arrived at a natural conclusion. The idea evidently was that if he were let into whatever secret happened to be going, he would betray it. Now, that in its turn implied that it was worth betraying, and this in its turn meant that somebody, somewhere, would pay him for betrayal. As he followed this line of thought, it became abundantly clear to Mr Orme's intelligence that he was being shamefully defrauded of the chance to turn an honest penny. He thought of his own hard and thankless lot, the scarcity of rum, or rather of its plenitude and his own inability to get at it—which is likely to have been the more harrowing form—the dearthness of tobacco, and the miserable and degrading exigencies of labour. With such spurs as these to gall his curiosity, he became very curious indeed, and began to develop quite a new phase of character, niching hither and thither in sloth-like dexterity to surprise conversations not intended for his ears, and industriously sleeping for hours together on the occasion of Isaiah's visits, in the hope of lulling suspicion as profound as that which he himself feigned. Unhappily for his purpose, he was a poor pretender, and not having had the advantage of self-examination in this particular, he could not be supposed to know that in his really somnolent hours he had a snore which seemed to communicate a faint vibration to the very door-knocker. His ruses, in short, were altogether too obvious and artificial, and did nothing but deepen the suspicion with which he had been regarded from the first.

But, as often happens, apparent chance did for him what no ruse on his own part could effect, and one day, rambling past the town police station and pausing to strike a lucifer match, he cast an idle and careless eye upon the proclamations posted at the door, and in the very act of moving forward again, stood, arrested at the names of 'John Vale and William Gregg aforesaid,' followed by a statement that the above reward would be paid on the discovery of the boys on application to Robert Snelliff, Corn-Factor, of Castle-Barfield, or William Gregg of Hargate Hollow, Beacon-Hargate. Beacon-Hargate was a mere hamlet, and Mr Orme knew nothing of it; but Castle-Barfield was a considerable town, and was but a little over an hour's journey by rail. It was Saturday and a half-holiday, and he had money in his pocket, his week's wages, newly drawn, and as yet diluted only by a single four-pennyworth. He tried to make out the amount of 'the above reward;' but the halfpenny was evidently old, and had been pasted over and over by other announcements. It would in all probability long since have been hidden altogether but for the fact that it had been fixed to a dower corner of the board.

Mr Orme fairly trembled with excitement at this fulfilment of his suspicions. What might the reward amount to? Ten pounds? Twenty

pounds? Fifty? A hundred? He flushed and shook to think that he could make a bargain of it, and bestirring himself to an unusual activity, he made straight for the railway station.

(To be continued.)

IN KENSINGTON.

IN 1820 appeared Faulkner's *History of Kensington*; and now, nearly seventy years later, we have a new history of the same interesting district of the great metropolis, from the pen of Mr W. J. Loftie, entitled, *Kensington, Picturesque and Historical* (London: Field & Tuer). Mr Loftie is already well known as the historian of London, his two volumes thereon embracing a record of the great city's growth from pre-Roman times to the present day. In the volume immediately before us, Mr Loftie works out a more limited subject, but the limitation is compensated for by the greater room for details. And the book, besides being extremely interesting in itself, is so beautifully printed and illustrated as to make its possession a delight to every lover of books.

Although Kensington now forms an integral part of London, it is not so very long since it was really a detached suburban village, the road between which and the city was infested by foot-pads and robbers, rendering it dangerous to wayfarers after dark. Kensington is closely associated with many great names, and contains many buildings of historic interest. The Palace is, of course, the most conspicuous of these edifices. It was here in 1819 that the Queen was born, and here, after her accession to the crown, that she held her first Council. The Palace was not originally a royal residence, it having been built by the first Earl of Nottingham, from whose son it was bought by William III. Since its acquisition by royalty it has been largely added to. It is a massive building in red and brown brick, with few architectural pretensions, and almost devoid of ornament. It was here that Mary, the queen and consort of William III., died of smallpox in 1694, and here also that William himself died eight years later. George II., the last king who made Kensington his residence, died in the Palace in 1760.

As already mentioned, it was in Kensington Palace that Queen Victoria was born, and on the north wall of the room in which she first saw the light is a brass plate bearing an inscription to that effect. 'Adjoining this chamber,' says Mr Loftie, 'is a handsome drawing-room, and behind it the room is situated in which the Queen held her first Council. It is a gloomy chamber, looking into a narrow courtyard, the roof supported by pillars. . . . The cheerful drawing-room beyond must have been the place where Lord Melbourne and the Archbishop announced her accession to the young Queen, in the early morning of 20th June 1837. It was, so far as I can make out, in this same chamber that the future Queen was christened on the 24th of June 1819. The golden font was brought from the Tower, and crimson-velvet coverings were brought from the Chapel Royal at St James's. The sponsors were the Prince Regent, who in the

following year became George IV.; the Emperor Alexander of Russia, represented by the Duke of York; the Queen Dowager of Württemberg, represented by the Princess Augusta; and the Duchess-Dowager of Coburg, represented by the Duchess of Gloucester. The Prince Regent named the infant Alexandrina only, it is said; but her mother's name of Victoria was fortunately added in time.' The Duchess of Kent and her royal daughter continued to reside in the Palace after the death of the Duke; and the young Princess was often seen in Kensington Gardens, sometimes taking her airings in a little phaeton drawn by two minute ponies.

Another interesting building is Old Campden House, built apparently about the beginning of the seventeenth century. After passing through various hands, it was tenanted for a time by the Princess, afterwards Queen Anne, and her little son the Duke of Gloucester, the only survivor of her numerous children. He was delicate from birth, and Kensington was selected for him as being a healthy place of residence and near town. When about four or five years of age he became very inquisitive, especially as regards anything relating to soldiers; and he got a corps of twenty-two boys of Kensington to come to Campden House accoutred with paper caps and wooden swords. 'Their appearance,' wrote his old servant, 'transported the little Duke, so that he made them come up from the court to his presence-room, and appointed one of them, a pretty boy, to be lieutenant, who proved to be Sir Thomas Lawrence's son.' By-and-by the boys formed two companies, amounting to ninety, armed with wooden swords and muskets, and wearing red grenadiers' caps. One day they were ordered to the garden by beat of drum, in order that the King and Queen (William and Mary) might see them exercise. 'The King ordered twenty guineas for the boys; and took particular notice of one, six years old, by name William Gardner, remarkable for beating the drum, almost equal to the ablest drummer. To him the King gave two pieces of gold.' The little boy-Duke said to His Majesty: 'My dear King, you shall have both my companies with you to Flanders.' The gallant little Duke died at Windsor, at the early age of eleven.

To visitors with literary and artistic tastes, perhaps the chief centre of attraction in Kensington will be Holland House. This, not so very long ago, was the great gathering-place of men and women distinguished in arts and letters, and readers of the political and literary biographies of the first half of the present century find constantly recurring references to Holland House, its occupants and visitors, its banquets and assemblies. Perhaps, however, says Mr Loftie, 'the brief connection of Addison with Holland House is more memorable than all the long succession of Hollands and Warwicks.' In 1716 Addison married Charlotte, widow of the sixth Earl of Holland; but he did not live quite three years thereafter. The marriage, by some accounts, was not a happy one. 'He died in what is now the dining-room, on the first floor, looking northwards over the gardens and the park. Perhaps he had chosen this room for its nearness to the principal library, where his writing-table is preserved.'

During the last century, the most illustrious name in connection with Holland House is that of Charles James Fox, who spent his early years in it. But it was while the house was in possession of the third Lord Holland that it rose to its distinguished position as the gathering-place of the best intellects of the day. Faulkner, in his history, very fully described the house as it was in 1820, 'the time when the greatest number of wits and celebrities of all kinds were entertained by Lady Holland.' Among these were Lord Macaulay, Sydney Smith, Sheridan, Lord Byron, Moore, Thurlow, Brougham, Curran, Washington Irving, Humboldt, Talleyrand, Madame de Staël, Sir Walter Scott, and many other persons of distinction. Lady Holland was famed for her hospitality, so much so, that Sydney Smith, when laid up in Holland House, said it was a place fitted with every convenience for sickness and death. The architecture of the house, Mr Loftie observes, is of a very mixed character. 'There are gates by Inigo Jones, and the later decorations are very classical in style; but the trace of old Gothic feeling is apparent everywhere. The gardens are very fine; with alcoves, statues, and busts, memorials of various kinds, and shady walks and avenues.'

Next to Holland House, perhaps, is the humbler residence in Young Street (then No. 13, now No. 16) where Thackeray dwelt so long and wrote some of the best of his works. The novelist himself had a humorous reverence for it. Mr Field says: 'I once made a pilgrimage with Thackeray (at my request, of course, the visits were planned) to the various houses where his books had been written, and I remember when we came to Young Street, Kensington, he said with mock-gravity: "Down on your knees, you rogue, for here *Fanny Hill* was penned; and I will go down with you, for I have a high opinion of that little production myself!'

We have only slightly touched upon a few of the outstanding reminiscences embodied in this handsome volume—a volume which is creditable in every way both to the author and the publishers.

ASTBURY'S BARGAIN.

A STORY IN SIX CHAPTERS.

CHAPTER VI.—REPARATION.

THE Overton Park carriage was at the gate of Cedar Cottage, and the footman was at the door respectfully awaiting the commands of Mrs Silverton. The carriage had been sent from the Park by Mrs Dacon to bring her mother and cousin to the grand juvenile fête which was to celebrate the fifth birthday of Mr and Mrs Dacon's only child, little Hetty. The widow liked to have the Overton carriage with its two fine bays standing in front of her house, and to have the footman in his quiet yet conspicuous livery standing at her door; and whenever she was sent for, contrived to keep the equipage waiting some time. On this occasion there was an extra delay, which was not Mrs Silverton's fault, but Daisy's.

When ready to start, the postman had delivered a letter from Gilbert. It informed her that he had arrived in Liverpool, and was just starting

for London, of course travelling under the name by which he was now known. He intended to make his way at once to the Cottage, and begged her, if she should be going out, to leave a message appointing an early hour for a meeting. Certain information had reached him which explained Dacon's strange illness, and he was most anxious to talk to her about it.

Daisy had not concealed from Aunt Silverton the correspondence with Gilbert; but as any communication between Cedar Cottage and 'that young man' was entirely disapproved of, she did not tell her much. Consequently, she was at a loss how to act in the present juncture, being excited by the unexpected intimation of Gilbert's speedy arrival. His sudden return plainly indicated that some calamity was about to befall the master of Overton Park. She determined to say nothing to her aunt until she had seen Gilbert, and simply left a note with the housemaid for 'Mr Harrison' telling him where a message would find her.

'I never knew you take so long to dress before, Daisy,' exclaimed Mrs Silverton as she lay back in the carriage with a delightful sense of her own grandeur and importance; 'and yet it is only a children's party.'

The fête was to be a very grand one. Dacon had attended to every detail himself, determined to produce for his child a scene of fairy wonders which should transcend all the pictures in the *Arabian Nights*. The autumn tints of the foliage on the Park trees were to lend their aid to the effects produced by the thousands of Chinese lanterns which were cunningly hung throughout the grounds; and a grand display of fireworks was to close the amusements of the young people after they were tired of dancing and feasting, and the home-bearing carriages were arriving.

Five-year-old Hetty was at the top of the lawn, receiving her numerous tiny guests and their grown-up guardians with as much composure as if she had been a queen accustomed to levees. Her father had made so much a companion of her that she was old-fashioned and self-possessed without being rude or obtrusive—a rare combination in a child. The only impatience she displayed was when she turned to her mother with the repeated question: 'But where is papa? He promised to be here early, and he always comes at the time he says he will.'

'He is late,' said Mrs Dacon, standing behind her daughter and looking anxiously down the avenue. 'But, my dear, he cannot always leave the office at a fixed hour, and he is very busy just now.'

Then the fun commenced; and the bands of merry youngsters were conducted through the shrubbery to the tennis-ground, which had been transformed into a miniature fair. There were swings and merry-go-rounds, a Punch and Judy show, a marionette show, a conjurer's and a fortune-teller's tents, and a fancy fair of toys of every description, to be distributed according to the number taken from a wheel-of-fortune at the entrance for every passer to dip into and draw out a ticket. Besides all this, there was a brass band playing with brassy loudness all sorts of merry tunes to make hearts glad and feet patter chirpily on the smooth grass.

And so, when the fun was at its height, papa

came home looking very weary and haggard. He did not go out into the midst of the merry throng, but went straight up to his bedroom and sent for his wife. 'Don't make any fuss, dear,' he said when she came; 'but I am too ill for anything except going to bed. I want to get a sleep. Maybe I will waken up refreshed enough to join the party. Go on with our arrangements as if there was nothing the matter. Promise me that.'

'Of course, Henry; but you look so ill that I must send for the doctor.'

'Nonsense, my dear; I shall be all right after a nap.'

'Papa, papa!' cried little Hetty, who had somehow discovered his arrival and rushed into the room, her bright amber hair touched by the rays of the setting sun and looking like gold. 'I am so glad you are here. Do come and see how the beautiful dollies are moving about just like real people.'

He took her up in his arms and kissed her—he seemed to gasp as he held her to his breast. 'Yes, darling, I will see the dollies by-and-by.'

The child kissed him, wondering that he should refuse to join her immediately in the play as she had requested. He had never done so before.

'You won't be long, papa,' she said, moving hesitatingly away; 'the dollies are so beautiful and look so real!'

'No, not long, pet. But you must go now—I am so tired.' He kissed her again and again, seeming to gasp for breath as he did so. The child, with a pretty toss of the head and a merry laugh, skipped away to mingle with her blithe companions in the pleasures so lavishly provided for them.

'I want to have a sleep, Hetty,' he said very tenderly to his wife; 'you know I have not had any for many nights; but I feel drowsy now. So, as the doctors say I must sleep if there is to be any chance of recovery, you will not on any account try to waken me if you should find me in a doze.—There now, go, and do what you can to make the little folk happy, and let me rest.'

The wife very reluctantly left him to return to her duties as hostess; but she found it difficult to smile, although the merry shouts of laughter filled the atmosphere with a sense of unclouded joy.

The twilight was fading into darkness when the fireworks were started, and three huge rockets ending in variegated sprays of blue and red inaugurated the programme. Before the first stick fell, a footman found Daisy, and informed her that Mr Harrison desired to see her.

She immediately followed the man in the direction of the house, but had only gone about a score of paces when she saw a gentleman advancing towards her. She felt her hand grasped with a fervour which sent a thrill of pleasure through her veins and brought the hot blood into her cheeks. That was Gilbert's grasp; but the sensation it produced was somehow different from what it used to be. In bygone times she trembled with the delight of touching his hand, because she believed it could never be her own. Now it seemed as if by some occult influence he had conveyed to her mind the impression that the hand was her own and brought with it a true and undivided affection.

'You are not sorry to see me here again?' he said.

'I am very glad. It is what I have always wished; but your last letter frightened me.'

'Let us cross the lawn to the beeches. We can talk there without interruption.—Will you take my arm?'

The acquiescing action was his answer; and they passed quietly into the shadow of the trees, where the glaring lights of the fireworks, now in full progress, could not discover them to the guests, even if the guests had not been too much preoccupied by the brilliant display to think of peering into shady nooks.

'I do not know how to prepare you for what I have to say,' Gilbert began, while he tried to see her face in the shadow. 'I had a letter from Dacon, which, read beside your last, telling me of his strange illness and of'—there was the briefest hesitation before he pronounced the name—'and of Mrs Dacon's anxiety, determined me to get back to London as quickly as steamers and trains could carry me.'

Daisy observed with satisfaction that he spoke of 'Mrs Dacon,' not Hetty, as it used to be; and of course it was right that he should do so. But she pretended not to observe the change.

'What did he tell you that could alter your resolution so suddenly? Hetty is only unhappy on his account, and is in no need of your help.'

'It was as much my thought of you that brought me back as my concern for Dacon'—

'For him!' she interrupted. 'Then it was not for Hetty?'

'Oh yes, for her too, and I fear what may happen to her. Dacon's letter told me that he was absolutely ruined.'

'He ruined!' she exclaimed, utterly unable to grasp the possibility of such a thing.

'Yes; the bankruptcy of the great house of Ellicott & Co. will be announced in a few days.'

'I do not understand. How can he have lost such an enormous fortune?'

'That is easily done by a man who confesses himself to have been a mad gambler from the moment when he first had the power to juggle with stocks and shares, and with such desperate ventures as no one in his senses who had anything to lose would touch. He says he was insane, and now realises it when too late to retrieve himself. I have his permission to tell you everything, or I would not tell even you, Daisy, that it was this mad passion that led him to perpetrate the frauds, from the consequences of which he was first screened by my flight, and then saved by the sudden death of his uncle, which gave him the means to take up all the forged bills. But even that terrible lesson did not cure him. As soon as his hands were free, with the whole capital of the firm under his control, he lost every glimmer of reason and business knowledge he ever possessed, and now he says nothing can save him.'

'And Hetty—poor Hetty—what is to become of her?'

'She will not be poor so far as money is concerned. He tells me that the one consolation he finds in the midst of the wreck he has made is the assurance that, no matter what happens to him, his wife and daughter are provided for. The marriage settlements were made when he was

perfectly solvent, and they give to her Overton Park with a sufficient income for its maintenance. The creditors cannot touch the settlements.'

'But you, Gilbert—how will this affect you?' was her next eager inquiry. 'Will you be safe? Will you be cleared of all blame?'

'I do not know. However, it seems that he has told everything to Mr Ardwick, who has promised to protect me from any charge in connection with the forgeries, and I will see him to-morrow. Dacon's chief object in telling me this was to persuade me to yield to his prayer that the knowledge of his crime might be kept from his wife and daughter, if possible. I mean to try to keep them in ignorance of it, and I want you to help me.'

'I will do whatever you think should be done.'

'Ah, then—— Daisy!—you will come back with me to Rio.'

She had no desire to resist the pressure of his hand as he drew her close to him and kissed her. She had no time to wonder then how it came to be that she was not more surprised at finding herself lifted in a moment from the ranks of the 'unattached' to the blissful heights of the Betrothed; she had no time then to wonder how it all came to be settled in such a simple way and everything understood between them with so few words—no time, for they were startled by the furious clatter of a horse's hoofs passing at full gallop down the avenue, from which they were screened by the beeches and shrubbery.

The band was playing one of Strauss's gayest melodies, and the children were shouting in wild glee at every new marvel of the firework display, and yet Daisy and Gilbert heard that horse's hoofs as distinctly as if there had been perfect stillness around them, and every stamp was like a loud bang-note of alarm in their ears.

'There is something wrong at the house!' cried Daisy with instinctive dread. 'That man is going for the doctor. Come, Gilbert; we must help her.'

He knew that she meant her cousin, and they were speedily convinced that she stood in sore need of help.

The anxious wife had at intervals stolen away from her guests to see how her husband fared. He seemed to be sleeping so soundly that she feared every fresh outburst of merriment, lest it should awaken him. By-and-by she was rendered uneasy by his stillness, for he did not seem to breathe. She touched him, and he did not stir. 'Henry!' she whispered tenderly in his ear; but he made no response. Then, becoming alarmed, she raised his arm, released it, and it fell lifeless by his side. She uttered a shriek of horror and anguish as she fell upon the bed beside the man she loved and believed to be so noble. The cry attracted a servant, who at once brought Mrs Silverton. That lady's dismay did not prevent her from promptly taking the practical measures necessary under the circumstances. She sent for the doctor, and had her insensible daughter removed to another room, where Daisy presently came to assist in waiting upon her.

On the arrival of the doctor, he said he could be of no service to Mr Dacon, who had been dead for two hours at least: the cause of death was prussic acid. So Henry Dacon was con-

sistent to the last, and sought escape from the consequences of his follies at any cost save that of manfully enduring them.

* In Dacon's private desk was found a packet addressed to Gilbert Astbury, containing two documents. The first was a plain acknowledgment of his guilt, and a full explanation of how the frauds for which Gilbert had been blamed were perpetrated. As a partner in the firm, Dacon had the right of endorsing bills, and he had forged the names of the correspondents who were supposed to have drawn them. In the ordinary course of business, Gilbert had got the bills discounted and received the money, which he handed to Dacon. Then it stated why Gilbert had agreed to screen him at the sacrifice of his own good name. 'But his sacrifice has been a torture to me,' the confession of the miserable man went on. 'I did hope to retrieve everything by my daring speculations and to restore Astbury to his right position. I failed. Great as was the fortune left to me, I have lost it all.'

The second paper was a letter to Gilbert, in which the writer stated that he had now made the only reparation in his power, and left him free to make any use of it that might best satisfy him. He only expressed the wish of a dying man that some way might be found to keep his wife and child in ignorance of the past.

Gilbert showed the papers to Daisy; and before he told her what he intended to do, she said in her calm, wise way: 'We will put these things out of sight, and say nothing about them, Gilbert. You are safe, and that is enough for me. Hetty is well off, thanks to the marriage settlements, and that should satisfy'—she was going to say 'you,' but arrested herself and said—'us all.—But do you think you can forgive me for being wicked and spiteful about something?'

'I don't know,' he answered, smiling as he looked into those clear blue eyes.—'What are you spiteful about?'

'I cannot help wishing Hetty to know that all the time whilst she was abusing you for blaming Dacon, you were tearing up and burning the proofs of his guilt and your innocence.'

'Yes, Daisy, that was a hard time for me. But whilst doing it and suffering her scorn, I was preparing the way for winning you—my own better self.'

There could not have been a more satisfactory answer than that. They were not, however, compelled to return to Rio—although they did so for a time—or to retain the pseudonym of Harrison. Dacon's attempt at reparation had been as complete as could be; and the information he had given to Mr Ardwick enabled that gentleman in the course of the winding up of Ellicott & Co.'s affairs to satisfy every one that Astbury had not perpetrated the frauds which had been placed to his account. Mrs Dacon and her child still remain in the blissful faith that Henry Dacon was a paragon of manhood; and Hetty is sure that Gilbert is innocent because 'Henry had always said so.' Mrs Silvertown carefully concealed the indignation she felt in regard to her deceased son-in-law for so recklessly squander-

ing her daughter's great fortune, as she considered it. She always took a lenient view of the sins of the rich; and success so completely restored Gilbert to her good graces, that even without the public announcement of his innocence, she would have been pleased to distinguish him as 'her dear friend and relative.'

A FEW WORDS REGARDING SOMNAMBULISM.

THE variety of states into which the human mind can throw itself, or can be thrown, is truly wonderful. In memory, imagination, and thought, there are conditions and workings which we are unable scientifically to explain. When, therefore, an endeavour is made to reach such a knowledge, facts are all-important, and the conclusions drawn from such facts must be in strict harmony with truth. A science at any time is a very difficult thing to bring to perfection; but, of all the sciences, the one treating of the human mind is the most difficult. In the other sciences, the subjects about which they treat can be seen, felt, and handled; but there is no handling of the fleshy brain, and the convolutions can only be studied when the person is silent in death. Every part of the study, with rare exceptions, has to be carried on in a second-rate way by means of memory and reflection. Strange irony of words; for is it not 'reflection' and 'memory' themselves we seek to know? and yet we can only know them by themselves.

Many things have been written and said regarding the waking operations of man's mind, but the silent workings of the same are and have been very often omitted. The silent workings are such as apply only to the mind when asleep. Thus, dreaming, raving, and the like, come under this class. The phenomenon we shall try to explain and illustrate in this paper is that called somnambulism. What is somnambulism? It really means an acted dream. While the mind is dreaming, the body is in general quiescent. All voluntary action is suspended, except now and then there may be a movement of the head, legs, or arms; but this is all done unconsciously, so that we are almost correct in saying all voluntary action is suspended. But in somnambulism the case is different; there is movement, and often a movement, too, of such a kind that the man if awake would never attempt.

Indeed, the judgment seems to be entirely gone in the case of the somnambulist. Dangers are encountered and feats of strength accomplished that would appear miraculous to the person who did them if awake. Take, for instance, the case of the gentleman and his nightcap. Every morning this gentleman's nightcap went amissing. No clue could be got as to its whereabouts or how it had been disposed of. At length he was suspected of being a somnambulist. He was watched. During the middle of the night he rose from bed, proceeded to the top flat of the house, opened a window in the roof, climbed from there to the rigging of the house, along which he proceeded with the greatest agility, pulled off his nightcap, and carefully placed it in the chimney-pot! This he had been doing for nights in succession, for in the chimney dozens of the caps

were found. Yet, when that man thought of his perilous walk, he shuddered at the very idea of walking along such a narrow foothold.

Cases, also, are on record in which the mind while in a state of somnambulism has shown itself more acute and active than when awake. The Edinburgh lawyer's case may be cited. This lawyer had for days tried to find out a method he could adopt for clearing a client's reputation. The case presented peculiar difficulties, which, indeed, were so difficult that the night preceding the trial found the lawyer still fighting for a solution to the problem. At length he gave up in despair, and went to bed. During the night, his wife saw him rise from bed and proceed to the table. He searched for pen, ink, and paper, and when he found these, he sat down and wrote hurriedly. At length he stopped writing, placed the paper carefully away, and returned to bed. Next morning he was up betimes to get 'a solution,' as he told his wife. But she had good news for him. She bade him search his desk. There he found a paper written out evidently a short time ago by his own hand; but when he did it was quite a mystery to him. He read the paper, and found that it gave him the very key he had been trying to get for his case. He expressed astonishment at the affair, and was sitting down to attempt by aid of memory to know what it all meant. His wonder can be better imagined than described when he was informed by his wife that he had written it but a few hours before, while in a state of somnambulism.

In somnambulism it is often asserted that there is an entire cessation of *will-power*. Facts, however, are forthcoming which tend to show that this is not always true. A German writer narrates the following: 'In Halle there lived a postman, whose duty it was to deliver letters at a small village three or four miles from the town of Halle. The road to the village led across a moor. Whenever the carrier had emerged from the town into the country, he fell fast asleep on his feet. While asleep, he continued his walking until he arrived at a small stream which ran close beside the village. Here the man stopped almost involuntarily and awoke. This method of crossing the moor he continued for twelve years; yet there was never an occasion when he in his sleep mistook the road, or even stepped into the water, which he always crossed by means of a small foot-bridge!' There was more than habit needed to keep to the right path and to awake when he arrived at the stream. But the peculiar point is that the man was able to get into the state, while he was quite conscious of what was about to follow.

From so many divergent cases it is very difficult to draw any inference on which we can depend for strict accuracy. But be this as it may, it cannot be doubted at least that the somnambulist can accomplish things he could never do if awake. There is a putting on of a new nature. The timid become fearless; the weak become strong; and the mediocre become ingenious. The only conclusion we can come to is, that the mind works under conditions, and displays phenomena, which as yet science has but imperfectly observed, and still less carefully concluded what their meaning implies. There is in the domain of mental

phenomena a field without boundaries, waiting only for the eye and the understanding keen enough to discover what nature has concealed for so long a time. But the study of the mind has been only reached through a gradual process of evolution. Man in his research began with matter; from that he passed to organism; and from thence to living organism; and now he is standing before the door seeking admittance into the temple where he hopes to find the mysteries surrounding his own mind revealed to him.

All the five senses of the somnambulist are not awake when he is in the state of active dreaming. There may be the activity of the eye along with the torpor of the ear; the activity of the mind along with the sleep of one or more of the senses. But, as a rule, the muscular sense seems always active; and many of the most remarkable performances both of natural and induced somnambulism seem referable to the extraordinary intensity with which impressions on that sense are perceived, in consequence of the exclusive fixation of the attention on its guidance. The dominant idea in the mind generally finds great help from the muscular sensations; the prevailing idea, indeed, is expressed by the various motions of the body. A mathematician will work out a difficult problem; an orator will make a most effective speech; a musician will draw forth most enchanting harmonies from his accustomed instrument; a mimic will keep the spectators in roars of laughter at the drollness of his imitations. These and a thousand other examples can be given of the various phases of somnambulism. It was said that there may be the torpor of one of the senses attended with the activity of the other. The following story illustrates this. Calvin and another friend were once travelling through Germany. One evening they arrived at a country inn tired and jaded. After refreshments, they resolved to employ their time in reading and listening to a book on theology. Calvin's friend was elected to read. This he did for about half an hour. Now and then Calvin put in a word of criticism; but he was surprised that his friend made no reply, but always continued reading. At length Calvin came to the conclusion that his friend was asleep and yet reading. The inference was correct, for when Calvin awoke him, the man, although he had been reading aloud most carefully, did not know one single fact the book contained!

The somnambulist's mind in sleep is only open to one prevailing train of thought. Sounds relating to that are noticed, but any other sounds occurring are as if they had not been. Thus, a young lady, when at school, frequently began to talk after having been asleep an hour or two; her ideas almost always running upon the events of the previous day. If encouraged by leading questions being addressed to her, she would give a very distinct and coherent account of them, frequently disclosing her own peccadillos and those of her school-fellows, and expressing great penitence for the former, while she seemed to hesitate about making known the latter. To all ordinary sounds, however, she seemed insensible.

The curious fact regarding somnambulism is, that the person subject to it cannot remember anything he did while in that state. This differentiates it from dreaming. And again, it

often occurs that the mind of the somnambulist can be gradually diverted, by careful scheming, into any channel the experimenter desires. The case of the officer who served in the expedition to Louisburg may be taken as an example of this kind of somnambulism. The narrator of the story says: 'At one time they [his companions] conducted him through the whole progress of a quarrel, which ended in a duel; and when the parties were supposed to be met, a pistol was put in his hand, which he fired, and was awakened by the report. On another occasion they found him asleep on the top of a locker or bunker in the cabin, when they made him believe he had fallen overboard, and exhorted him to save himself by swimming. He immediately imitated all the motions of swimming. They then told him that a shark was pursuing him, and entreated him to dive for his life. He instantly did so with such force as to throw himself entirely from the locker upon the cabin floor, by which he was much bruised, and awakened of course.'

There is also a peculiar case of somnambulism called 'induced somnambulism.' The method was first discovered by Mr Braid. It consists in the maintenance of a fixed gaze, for several minutes consecutively, on a bright object placed somewhat above and in front of the eyes, at so short a distance that the convergence of their axes upon it is accompanied with a sense of effort even amounting to pain. When the state of somnambulism is thus obtained, just as in the *natural*, there is no remembrance of what the mind or body was engaged with. There is, however, less agility shown by the person in this state. In natural somnambulism, every part of the muscular system seems to be active and capable of doing almost miracles; but when in the induced somnambulist state, the person's movements are slow, and the mind's activity is very heavy and difficult to rouse.

THE MONTH:

SCIENCE AND ARTS.

It is proposed to bring under the consideration of parliament a Bill to provide for the erection and maintenance of a Monumental Chapel in connection with Westminster Abbey. There is a natural dislike on the part of most thoughtful persons to interfere in any way with historical monuments except in the way of necessary repair, a dislike which has been bred of the sad destruction and mutilations which have happened in the past to some of our finest buildings. The Abbey at Westminster is unique in representing by its graves and monuments centuries of the history of our country. But the time has at last arrived when no more space is left in this British Valhalla, and the continuous chain of events must be broken unless a remedy be found. That remedy is indicated in the title of the Bill which we have referred to. It is hardly necessary to point out that the particular form which the addition to the old Abbey will take must be the subject of diligent consideration, and that the architects employed must be instructed to make the new work strictly subservient to the old.

It is curious to note how sometimes in this age

of mechanical perfection we hark back to simple methods in use long ago. A case in point is afforded by the resuscitation of the old-fashioned Howitzer or mortar, which most of us regarded as about the most obsolete form of gun to which one could point. But from such guns much is looked for in the matter of coast-defence, for recent experiments have proved its extraordinary value in this service. The path and range of a shell from such a mortar with a given charge of powder have been calculated to such a nicety, that a projectile can be thrown with wonderful accuracy of aim. In some recent experiments the target was a floating platform of the size of the deck of a first-class ship moored three miles out at sea. The howitzer was in a pit on shore, from which the firers could not see the object aimed at; but they were in electrical communication with others at a distance, who by means of range-finders could give them accurate directions as to elevation of the gun. Under these seemingly hopeless conditions, the comparatively small target was struck seven times out of twenty shots, and was barely missed by several others. A shell charged with one of the new explosives, striking the deck of a ship in such a manner, would infallibly sink her, so that in the once despised howitzer we may look for the most efficient means for coast-defence.

Under the name of Gaedcke's Monochromatic Lamp, Messrs Marion of London have introduced an entirely new form of luminant for the use of photographers, which, while affording a light brilliant enough to work by, will not affect the most sensitive chemicals, for it emits no actinic rays. It consists of an ordinary Bunsen burner (or a spirit-lamp if gas be not available), having in its flame a small ring of asbestos, which is previously charged with a salt of sodium. The sodium salt gives the flame a brilliant yellow colour, which is further modified by a tinted glass chimney. We believe that this is the first application of a flame coloured by chemical means to such a useful purpose.

Mr T. Bonner of the Free Public Library, Ealing, has forwarded us an interesting description of the method which he has invented for the easy distribution and record of books borrowed from the collection under his care, which seems calculated not only to save much time to all concerned, but to dispense with a large amount of clerical work. The system cannot be fully described here; but it will be sufficient to indicate that each book in the library is represented by a small pentagonal block of wood, each side of which bears the number and title of the work in white letters upon a differently coloured ground. These blocks are kept in suitable spaces on shelves, and the particular side exposed to public view will show not only whether it is out, but whether the borrower has held it for one, two, or more weeks. Accompanying the block is a ticket giving the name of the holder of the book. These blocks, therefore, not only afford the information detailed, but also in a measure constitute a library catalogue. Free libraries are now, happily, on the increase, and any systematic method which reduces friction in their machinery is a matter of public importance.

Twenty million artificial teeth were made in America last year by three of the largest firms engaged in that business, a number which is said

to be about half that of the production of this country. It is a peculiar feature of this various industry that teeth have to be tinted according to the country for which they are intended. In North America and Canada, white teeth are considered—as in this country—to be the beautiful. But in South America, such molars would not be purchased at any price, for there yellow teeth are considered beautiful. At the same time, the yellow man, in China, with whom a large trade is done in teeth, must have them black as ebony.

Mr W. Linton-Wilson has recently published a method of effectually dealing with seed which is infected with the larvæ of the bean-beetle, a plan which could no doubt be successfully employed in the treatment with seeds of other kinds which may need similar purification. He soaks the seed so contaminated for an hour in a ten per cent. solution of paraffin and water, or, to be more correct, in a mixture of one part of paraffin to ten of water. He says that after this treatment he could not find one larva alive. The method has the merits of cheapness and simplicity, and farmers would do well to make a note of it and give it a trial.

Patent horseshoes have been invented time after time, which their inventors fondly hoped would supersede the old method of shoeing; but still the blacksmith exists. By the last method brought forward, the forge is altogether dispensed with, and what is called 'cold'-shoeing takes its place. In this system, which has been introduced by the Nailless Horseshoe Company, the shoe is attached by a single steel band which embraces the hoof, and is kept in position by a steel pillar in front which connects the band with the toe of the shoe. Three small studs, which to a certain extent indent the hoof, help to prevent the shoe from shifting its position. The advantages claimed for the system are many, the chief being the time saved in the operation of shoeing. Instead of the fifteen minutes at present necessary for the work, under the new method a shoe can be fixed in three minutes; a hammer, or even a stone, being the only tool required. The new shoe is durable, not heavier than an ordinary shoe, and is withal a cheaper article. It is believed that this method of shoeing horses will be found of great service in the army, where the accidental casting of a shoe might often lead to serious delay.

Our contemporary *Iron* points out that it is a common error that pianos should be kept very dry, and explains why such extreme care to avoid damp is really most harmful to the instrument. The wood of a piano, however well seasoned, must contain, like all other absorbent bodies exposed to the action of a moisture-laden atmosphere, a certain amount of residual dampness. When, therefore, the piano is continually subjected to very dry and heated air, it parts with this moisture, and its woodwork is apt to shrink and crack. The leather and cloth used in the action of the instrument also shrivel up under such treatment, and the tone of the piano suffers in consequence. The remedy advocated is to keep a growing plant, well watered, in the same room with the piano. In America, where closed stoves cause rooms to be far drier than they are on this side of the Atlantic, it is cus-

tomary to keep a vase containing a well-soaked sponge under the household musical instrument.

The Sanitary Condition of London formed the subject recently of an interesting address at the Parkes Museum, by Dr G. F. Poore, who pointed out that the mere age of a large city tended to make it unwholesome. In its ancient days, London was well supplied with water, for, in addition to the Thames, there were many tributary streams, such as, for instance, the Fleet, Westbourne, Tybourne, Walbrook, &c., which names are still preserved in other ways, while the rivers themselves are represented by underground sewers. The presence of marshy land on nearly every side, which became foul with every description of refuse, made medieval London a perfect fever-den, a condition of things to which unpaved streets and insanitary houses greatly contributed. Modern London, with its low death-rate, contrasts very favourably with the ancient city, particularly when we remember its vast increase in size. But the lecturer argued that this death-rate must not, in fairness, be compared with that of a city packed with operatives, and where few wealthy persons can be found, for the presence of the will-to-do must have the effect of lowering the death-rate. The plan of treatment of sewage by precipitation was referred to as not tending to a wholesome result, and the pouring of one hundred and fifty million gallons of sewage daily into the river was described as a gigantic blunder.

Now that the attention of Government is seriously directed to the condition of the navy and to the necessity of building new ships, it is to be hoped that some means will be found of preserving in a state of efficiency those which we already possess. A rather startling report as to the corrosion of steel ships has lately been published as emanating from Portsmouth. It seems that H.M. *A. Nile*, which was launched exactly one year ago, has recently been placed in dock. Upon examination of her hull, it was found that the protective coating of red-lead had peeled off, and that the metal beneath showed serious corrosion all along the water-line. In some cases, it is stated that the rivets which hold the plates together are completely eaten away.

The coaling of our ships is another question to which experts will have to direct their earnest attention; indeed, this subject was recently stated to be 'the most important factor in the whole science of naval warfare.' This is at least the opinion of Lieutenant Greig, whose paper dealing with the subject recently was read at the Royal United Service Institution. It would seem from this exhaustive paper that our method of coaling is much the same as it was when steam was first introduced into the navy, and that some of our larger ships cannot receive their complement of coal without remaining idle for nearly twenty-four hours. Surely, a mere mechanical question as this is can be solved if competent engineers turn their attention to it. Possibly, however, the time is not far distant when coal will be superseded by liquid fuel.

A new machine for sweeping and cleansing the streets has been tried with some success in the metropolitan thoroughfares by permission of the Commissioners of Sewers, who provided men, horses, and carts for the experiment. The appa-

ratus employed can be fixed to an ordinary mud-cart, and consists of a series of brushes on spindles working by means of an endless chain. These brushes sweep the liquid mud up a short incline towards a receiver, into which dip buckets, after the manner of a dredging-machine, to raise the refuse into the cart proper. Motion is conveyed to the apparatus by travelling wheels, and all is self-contained. In connection with this matter of street-cleansing it may be mentioned that a proposal has lately been made to adapt Mr Strawson's Agricultural Machine for distributing Powdered Granular or Liquid Matter over Land to street use, one suggested employment for it being the scattering of salt over snow-covered roads. This would certainly be effectual so far as melting the snow is concerned; but the fact that by such means a terribly low temperature would be created under foot, which would lead to inconvenience and danger to health seems to have been strangely overlooked.

A new industry is foreshadowed in a paper recently read before the French Agricultural Society by M. Guerin. This gentleman has been carrying out a number of experiments, the results from which tend to show that milk in a frozen state will preserve all its characteristics, and will be in every way as good as fresh milk when, after some days, or even weeks, it is thawed for use. In the frozen state it can, moreover, be transported from place to place with the greatest ease. The freezing process can be accomplished with ordinary ice-machines, and those having access to such appliances will be interested in repeating M. Guerin's experiments. Both cheese and butter made from frozen cream are said in no way to differ from that made in the usual manner.

So many reports for and against M. Pasteur's treatment for hydrophobia or rabies have of late years appeared, that we are glad to have at last an authoritative statement as to the number of British subjects who have availed themselves of the treatment to be obtained at the Pasteur Institute. This statement is in the form of a recently published parliamentary paper, and of the two past years. It tells us that, in 1887, fifty-four British subjects were under treatment at the hospital, of whom five died. Among these unfortunate sufferers three were consoling themselves by the thought that they were not cauterised, and were by the way, as the report states, "in ten places." We note that in all these five cases the subjects were given by dogs recognised to be rabid by veterinary surgeons. In the following year, M. Pasteur treated twenty-one of our fellow-countrymen without any death record; but it is right to add that one woman, bitten last December by a dog recognised as rabid, was still under treatment when this return was published.

A paper was read some short time since before the Medical Society of Virginia by Dr C. E. Bussey, from which parents and teachers might take a valuable hint. The lecturer urged on his hearers the importance of including vocal music in the studies of children as a matter affecting their physical well-being; and he asserted that if an hour daily were given to this pleasant and healthy exercise of the lungs, we should not see so many drooping, withered, hollow-chested, round-shouldered children, and that vocal music is a distinct preventive of phthisis. In singing,

the lungs have to be filled at every breath to almost their utmost capacity, and are thus subjected to energetic gymnastic exercise. The doctor further urged upon his hearers that the musical instructor should possess himself of a knowledge of the anatomy and physiology of the respiratory organs. These sensible remarks are of great value in the present day, when there is an unfortunate tendency to cram the minds of children, with little thought of their physical requirements.

A French scientific journal urges the desirability of sugar-manufacturers, who are mostly complaining of hard times owing to over-production, increasing their incomes by making paper from the cane as a supplementary industry. It is asserted that the fibres of the sugar-cane make an excellent paper, and that the mechanical and chemical treatment necessary in the work present no unusual difficulties. One gentleman at New Orleans has lately exhibited there a number of samples of white paper so made, which were of very fine quality. Whether it is practicable thus to combine two industries which seem at first sight to be so very different from one another, and which both require such large plant, remains to be decided by experience.

From experiments recently carried out at Chadwell Heath, Essex, it would seem that we have at last in the substance called Bellite an explosive which, while being actually more destructive in its effects than dynamite, is singularly safe to handle. A cartridge of bellite placed on a coal-fire was simply roasted away without exploding. A mass of iron, weighing more than one hundred-weight dropped from a height of eighteen feet upon some compressed from a height of eighteen feet and the brittle naked cartridges merely flattened them; cutting up the same cartridges were presently used for were a piece out of an iron rail, when they exploded with a percussion fuse. In a hole bored in the earth a number of bellite cartridges were mixed with blasting-gunpowder, and when the latter was fired, the said cartridges were scattered in every direction, but not exploded. Other experiments of a like surprising nature were successfully carried out. Their importance can be gauged when we remember that many tons of explosives are annually used in this country alone in industrial operations, and that it is highly necessary that they should be of such a nature that they can be employed with a minimum of danger by those who are too often ignorant and careless.

Londoners have lately been startled at the sight of a vehicle without horses or other visible motive-power which has been seen threading its way through the crowded traffic of the City streets. This vehicle, which has the appearance of a commodious omnibus, with seats for twelve passengers, is driven by electricity, and its coachman controls its movements from a platform in front. The inventor of this Electric Omnibus, which may possibly be the pioneer of a new system of street-traction, is Mr Radcliffe Ward, and he has constructed this experimental vehicle in order to prove that its movements can be well controlled in the most crowded thoroughfares. Horses show no fright at its appearance, and behave as if they recognised in it a deliverer from their hard lives. Mr Ward calculates that the substitution of his system by an Omnibus Company for horse-

haulage would mean a saving of from thirty to fifty per cent. There is little doubt, so that the general adoption of vehicles, propelled by electricity would lead to a great saving in road-repair, for it is well known that the horses' hoofs damage the roads far more than do the wheels of the various vehicles which traverse them.

About twenty years ago, one of the spandrels beneath the great dome of St Paul's was decorated with a mosaic picture, this beautiful style of decoration having at that time been revived in this country by Dr Salviati. A second spandrel is now to be filled in in the same manner, the design being from the poetical pencil of Mr Watts, R.A., Dr Salviati being again entrusted with the work. This profuse decoration of the interior of our metropolitan cathedral was the cherished idea of its great architect. He was not allowed to have his own way with regard to many points during the construction of this noble edifice, but his descendants are now ready enough to redeem the past.

The various uses, scientific and otherwise, to which the magic lantern is now put, both in the halls of learning and in more popular gatherings, render that instrument a very valuable adjunct to our educational agencies. The improved systems of lighting the lanterns, which the science of the last twenty years has developed, have also added greatly to their utility. For those who would wish to have an accurate knowledge of the powers and possibilities of these lanterns—now no longer regarded as toys—a book recently published will be found most helpful. It is entitled *The Book of the Lantern*, by Mr T. C. Hepworth (London: Wyman and Sons). The book is really what it professes to be—a practical guide to the working of the optical (or magic) lantern, with full and precise directions for making and colouring lantern pictures.

'STREET-SELLERS.'

IN these days, when want of employment is with many a chronic disease, it is interesting to observe the manifold ways and means adopted by a certain class of men to enable them to earn a more or less honest living. While one man sits and wails because he has not sufficient money to provide himself with the good things, or even the necessities of life, another, possessed of the true trading instinct, together with a profound knowledge of that pleasing feature of an Englishman's character termed 'gullibility,' sinks his whole capital, amounting perhaps to upwards of a shilling, in obtaining a stock-in-trade, and hies him, after the shades of evening fall, to the corner of a street in the City, or to the market-place of a country-town, plants his establishment firmly on its support of three sticks, and proceeds, first, to attract a crowd, and then to attract into his own pockets some of the superfluous metal which reposes in those of his hearers. If my reader will accompany me in spirit to one of these market squares, we will observe some of these street-sellers at work, and see how easily some

men, with no other qualification than the possession of a large amount of assurance, can dispose of worthless goods, and in a few hours provide themselves with sufficient money to pay their tavern score, which constitutes the heaviest item of the day's expenditure.

Observe, first, this loquacious individual, respectably attired, and wearing a confidence-inspiring and glossy tall hat. For the last twenty years he has been doctoring the British public with 'flagroot'—that is, the root of the iris. He stains the root to a brownish tint, gives it a delicate perfume by means of a few drops of bergamot, and offers it to the public as an Indian herb, with a name that takes away the breath of his audience, and which only long practice enables him to pronounce. Grated and taken as snuff, it relieves headache; rubbed on the gums, toothache becomes a thing of the past; used internally, dyspepsia takes wings, and the patient's landlady gives him notice to quit after one week's experience of his renewed appetite. The vendor of this root assumes the air of a philanthropist and public benefactor, and does a flourishing business.

Farther on, we come across a more pretentious aspirant to relieve suffering mortals of their ills and superfluous cash. He addresses the crowd from an elevated position on a richly gilded and decorated open carriage. On the seats on each side of him are piled bottles of pink-coloured fluid, and he holds one of them in his hand as he eloquently discourses on its nature and properties. He commands the services of a seedy-looking assistant; but the doctor himself is resplendent with jewelry, and looks like some foreign nobleman in his fur-tipped overcoat. Certain little peculiarities in his speech, however, proclaim him to be a countryman of our own who has graduated in the neighbourhood of Whitechapel.

There is one feature in this great man's mode of doing business calculated to inspire confidence: he freely offers to allow the remedy, which he calls 'Pain-killer,' to be tried 'free, gratis, for nothink,' before purchasing. At the top of his voice he calls on any one suffering from a pain of any description to approach the carriage and be operated upon in full sight of the audience. Many accept the invitation; and people with headaches, faccaches, pains in the chest and other parts of their anatomy, mount the carriage, are dosed or rubbed, and declare themselves highly gratified. Half a bottle is expended on the limbs of an old man suffering from rheumatism, and he expresses himself in glowing terms of the relief afforded him by the application. The assistant's energies are wholly absorbed in handing out the bottles at sixpence apiece; and the result of the doctor's efforts must afford that high-minded philanthropist intense satisfaction when in the privacy of his chamber he casts up his accounts.

Whether the effect produced upon the patients by the application of the 'Pain-killer' is the result of faith or some real virtue in the remedy, I cannot say; but any one may test its efficacy for himself. It consists of rum and water mixed with cayenne pepper. If applied outwardly, the hand should be passed over the skin in one direction only, as it is rubbed up and down, the result will surprise but not gratify.

There is a man hacking and chopping a small log of wood with a razor, and appealing to his

audience to observe that there is no deception. Then rubbing a small quantity of his incomparable paste upon a piece of leather, he straps the razor thereon, and to prove its efficacy in restoring the edge, severs with the blade hairs pulled from some boy's head for this purpose, or shaves the back of a man's hand. He repeats the operation of spoiling the razor's edge and restoring it by a few passes over the strop as often as necessary, or borrows knives from persons in the audience and sharpens them in the same manner. This paste he sells in cakes, and it is composed of hog's-lard and fuller's-earth.

Articles of this class never vary in the materials from which they are made, no matter in what part of the country we find them offered for sale. Here is the vendor of 'grease and stain remover.' He has captured a very small boy, whom he holds fast with one hand, while he operates upon his coat collar with the other, discoursing meanwhile upon the utility of the compound. It is exactly the same preparation as that with which the hawkier offered to remove the stains from the garments of Bill Sikes, and consists of pipeclay worked together with red-lead and blue-stone, to give it a streaky appearance.

And the silver-plating man must not be passed unnoticed. He is busily engaged before a small knot of onlookers in silver-plating a brass door-knob by means of a pink-coloured powder. He explains the process, which is very simple, it being only necessary to rub the powder over the surface of the article which it is desired to plate. Articles of cheap jewelry borrowed from the audience are plated free of charge, and the powder itself is sold in penny packets, though even at this low rate the vendor makes a large profit, sixpennyworth of mercury mixed with a pound of whitening and red ochre being sufficient to make into thirty or forty packets.

This class of sellers may be said to give some return for your money. But there is another class to whom the term 'sellers' applies in more senses than one. Here is a seedy individual offering wedding rings at a penny each to the eager circle which surrounds him. The rings are of the brassiest description, and so is the vendor. He commences operations by relating the story of Captain Barclay who once made a wager that a man standing on London Bridge could not sell a number of good sovereigns at a penny each in a specified time. The agent appointed to offer the coins disposed of only one. He then goes on to say that a similar wager has just been made by two local celebrities, and that a large sum of money depends on whether within a limited period he can dispose of the fifty solid gold rings which he holds in his hand. With solemn aspect he assures his hearers that the rings are genuine gold, and professes the utmost indifference as to whether he sells any or not. He speedily disposes of the precious articles among the younger members of the crowd; and by the time the purchasers have discovered their folly, he is far away, repeating the old story to a new audience.

The sporting prophet, who disposes of his scraps of paper which he calls 'tips'; the vendor of cement, who mends pieces of crockery-ware with his composition of shellac and resin, and then makes frantic efforts to break them again without success; the 'corn-curing hero,' with his salve of

fused tallow and resin, and his bottle containing small pieces of turnip carefully cut and trimmed to present the appearance of extracted corns, supposed to have been preserved by those who have used the remedy, and presented to him as a slight testimonial and mark of gratitude—these and others dot the market-place and adjoining streets, pursuing their calling with commendable energy, and a sublime faith in the public, born of experience, and affording to the philosopher who gives to both vendor and his customers a more than passing thought, much food for reflection.

BEYOND WORDS.

LITTLE maid in homespun gown,
Simple as the daisies,
Loving lips and eyes of brown—
Let me sing your praises.

Shall I call my love a flower
Gathered to my bosom?
No; they fade from hour to hour,
And I want my blossom.

Shall I call her precious pearl?
Set not jewels nigh her!
Only just a country girl,
Yet not a king could buy her.

Shall I call her angel blest,
Whitest soul of woman?
Stay!—I think I like her best
Laughing, weeping, human.

Is she, then, a sparkling star
Sent to guide and cheer me?
Ah! the skies are cold and far,
And I like her near me.

Not a name is there on earth
Of a poet's giving,
Fit to tell one half her worth,
Real, true, and living.

Rhymes and words of mystery
Only would amaze her;
For her own sweet self is she,
And all my deeds shall praise her.

SCHOOL-GIRLS.

WHEN our grandmothers were young, school-life was very different. It was the reign of the back-board and the needle. The little maidens with curls, low-necked gowns and short sleeves, learned to play in a primitive manner, to sing and to dance; but above all things they used the needle, and they walked about at stated times pinioned by the arms to the backboard. The modern reclining board is only a degenerate descendant of the instruments of polite torture which straightened and stiffened our grandmothers, and made of them those fashionable figures that in due time lured our grandfathers to write cocked-hat notes, fight duels, and fall in love with them. This consummation reached, our grandmothers in the days of their youth mostly forgot their 'accomplishments,' and managed the house, never opening the piano except, after years, to rattle a dance for the new race of juveniles. They were clever housewives, and had plenty of nature's wisdom and woman's sympathy. Men in those days seem to have needed nothing more. Except in rare cases, they did not expect wives to be intellectual companions. The wife was content to say with the woman's voice from *In Memoriam*:

I know but matters of the house,
And he—he knows a thousand things.

The schools of the old days of course boasted that they would make the girls know a thousand things too, only the branches taught never happened to be learned by any human head all at the same time. As far as talk went, they were as ambitious in our grandmothers' days as in our own. Only let readers of Thackeray turn to Miss Pinkerton's letter recommending a choice of young dragons fresh from her school: 'Either of these young ladies is perfectly qualified to instruct in Greek, Latin, and the rudiments of Hebrew, in mathematics and history, in Spanish, French, Italian, and geography, in music, vocal and instrumental; in dancing without the aid of a master; and in the elements of the natural sciences.' It

would have been impossible not to respect a young lady who could instruct her partner in the rudiments of Hebrew during the twirling of the dance. But unfortunately, what they learned at Miss Pinkerton's was forgotten or laughed at when flirtation began. 'Who'd think the moon was two hundred and thirty-six thousand eight hundred and forty-seven miles off?' Becky Sharp said to George Osborne on the balcony at Brighton; then she turned her gaze from the orb to the officer, with a fascinating smile: 'Isn't it clever of me to remember that? Pooh!—we learned it all at Miss Pinkerton's!' The opposite character, the foil of the famous Becky, the soft and sweet Amelia Sedley, was chiefly praised for her needle-work when she left school, and her parents were advised to finish her education with 'a careful and undeviating use of the backboard for four hours daily during the next three years.'

Lawn-tennis has begun to do the work of the dreaded board; and the sewing-machine, which may be said to have lengthened life by saving time, is driving the domestic needle out of the field, by leaving it only a small province to work in. But in the main, school-girls are still the same, and so is the ambition of the prospectus as directed by the Lady Principal; the greatest difference is that Becky Sharp would now have to be drilled by examiners, and would, in her light-fingered manner, snap up 'certificates' for having the possession of information that she would forget soon after.

There are really two views of girls' education abroad in the modern world. One view looks mainly to the girl, and the other looks mainly to the knowledge. The second view is the most in vogue, and its mistake is that, like all new systems, it is likely to be carried to exaggerated lengths. There was hardly ever a good thing started in the world that was not at first exaggerated by its promoters in trying to fight the battle to get standing-ground for it at all. When the examination and certificate system is carried too far, we must set it down to the error of earnestness in the struggle of this new view to

find place in the world. Other people hold to the opinion that the girl herself is the best thing to be thought of, and not the amount of knowledge she can acquire. Our greatest art-critic, who has a bright and fanciful ideal of girlhood, has somewhere said that the three things they ought to learn are to dress, to sing, and to dance! And he gives the necessary explanation of these words by saying that dress includes good taste in appearance, and the ability to make clothing of the most becoming style; that to sing and dance signify to rejoice and to give joy, which she ought to do to all around her by her looks, her voice, and her presence.

Leaving this great question of education for the wisest heads to solve according to their better knowledge, we turn to the more charming subject of the school-girls themselves. They are often enough like the Japanese trio, made of laughter, and thinking life a joke that is just begun; but this is only one type. The unconscious school-girl beauty is another, and that is a veritable vision of delight. There are schools where coquetry is learned side by side with grammar, and where the passions of grown-up people begin to spoil the happy air of childhood. It is a sad mistake. The little beauty we admire has not the slightest idea of her gift—for the chatter of the class on this point is generally misdirected, and the pretty ones singled out are not those that would be chosen by experienced eyes. This little maiden is just at the meeting of the brook and the river. Her fingers are ink-y, but her face would pass for one of Reynolds's angels, or else for the very youngest Virgin of delicate pure features that Perugino ever painted. Three or four summers more and the pair of blue eyes will find out their power. At present she will thank you for an apple; and when she smiles, it would be profanation to tell her of her loveliness. In a little while she will have to be sought on bended knee, and won in the zenith of her glory amid the heart-burnings of women and the struggle of strong men.

Another type of school-girl is the little mother. Something of a motherly instinct is irrepressible in this girl's heart. She makes favourites of the smallest among her companions, and the distant home is still encumbered with the old dolls on which she lavished her love in nursery days. With the thought of this type, a garden comes to mind, with summer trees and level grass, and with a group of orphan children allowed by kindness a country holiday in the garden of their richer sisters. When the memory-picture begins to move, one nobly-born girl, as handsome as a young gypsy, is proud to carry the youngest of the poor little visitors enthroned against her shoulder. She leans strongly backward, and the fine arm encircles her little burden naturally, as if she had been used to carrying small orphan children all her life. One has great faith in the good and happy future of this simple tender type of school-girl.

The studious girl is generally highly nervous and sensitive, and works from an instinctive earnestness of character. It is well to persuade her that 'the bright Yum-yum' is also to be admired; for the studious little maiden wants and deserves twice as much recreation as her lazy companions. The lazy member of the class is the

very opposite to the earnest little creature who is born with the instinct of trying to do well. With a recollection of a vanished Eden of bright windows and polished floors, sunny garden, and merry faces, there comes back the picture of a Saxon Edith, who was always laughing except when she was crying. She was a fair and round-faced little maid, who could make a rosebud out of her cheek by encircling a pinch of it with a dainty thumb and finger. She would violently dispute some vain trifle, perhaps whether her mother was related to the Duchess of Portland; and after vowing never to speak to her best friend again, the fair eyebrows would reddens, the handkerchief would be made into a comfortable ball, and the rosy round face would pillow itself and enjoy a luxurious cry—until the laughter and the sunshine burst out more vigorously than ever. This soft and careless girl developed rapidly into a staid and serious matron; while the quietest and most studious of her friends grew up into a bright and radiant character, brimful of humour and of irrepressible gaiety. The secret of the change lay in this: that the one child's nature, though bubbling over with mirth, was shallow; the other did with her whole heart whatever she turned to, and as childhood changed to womanhood she evidently discovered that it is worth while to laugh with one's whole heart as well as to work, and the strong nervous character had the energy to act upon the discovery.

Taken as a whole, a cluster of school-girls—say, as in the famous 'School Revisited,' under the trees of their own garden—are a most pathetic sight and a wonderful mystery. Their sorrows are all before them, and their romance too. Soon they are to scatter out of their happy world to go through the real novel that is not measured by three volumes. There are two things that surely we should never forget in thinking of these weak and thoughtless little women: first, that it is unfair to the girl ever to expect education to give her the mind of a boy, for the nature of her mind is as different as a young willow wand from a sapling oak; and secondly, that she is the woman of the future, and her worth to the world will not be measured by the amount of her learning, which, because of few years and delicacy of frame, has its limits, but that her worth will be measured by her beauty of character, which is capable of development to a breadth and depth and height beyond our mortal reckoning.

JOHN VALE'S GUARDIAN.

By DAVID CHRISTIE MURRAY,

Author of 'VAL STRANGE,' 'JOSEPH'S COAT,'
'RAINBOW GOLD,' etc.

CHAPTER XV.

MR ORME was a stranger in Castle-Barfield, but he had no difficulty in finding the High Street, and went shuffling up and down it with an eye of inquiry for the shop sign of Robert Snelling, corn factor. Somewhere in the dim middle of his mind a sense that he was acting shabbily was strong enough to keep him from asking questions even of strangers who could not possibly know anything of his business. He blustered at himself, as that kind of shabby sinner will. The boys ought to be at home again, the young rascals.

What business had they to be running unprotected about the country, earning their own living, whilst their relatives were obviously well-to-do, and were willing to pay hard money for the privilege of having them at home again. He saved his conscience by the reflection that he was not in any way betraying confidence, because no confidence had ever been reposed in him.

'They should have let me into the secret,' said Mr Orme, 'and then perhaps I mightn't have sold them.'

He had never been fond of pedestrian exercise, and if he had known it, the Hindu proverb would have suited him to a hair: It is better to stand than to walk, better to sit than to stand, and better to lie than to sit. Barfield High Street is a mile and a half in length, and Mr Orme choosing to look in the busier part of it, went lazily strolling up and down there until he grew hot and tired. He was always thirsty, but heat and fatigue made him thirstier; and exhausted nature, after a quarter of an hour's uneasy rambling, so cried out for rum-and-water, that he let it have its way. The dram-shop into which he turned was empty of customers, and Mr Orme, with secret sidelong glances, beckoned the man behind the bar into a corner, and there furtively rubbing the back of his hand on his bristly lips, inquired secretly for the address of the man he wanted.

'Snelling?' said the barman, 'Robert Snelling? Why, he's left the parish months and months ago.'

At this Mr Orme's countenance fell dolefully; and the barman, throwing open a door in the rear of the shop, shouted to some invisible person in the interior of the house to ask where Snelling the corn factor had moved to.

'Sh-h!' said Mr Orme, with a rum-and-watery fear lest the query should be overheard in Warwick, thirty miles away.

The man took no heed of him, and a voice shrieked back that Snelling had gone to live at Beacon-Hargate. Learning that Beacon-Hargate was rather better than four miles away, which meant to his intelligence rather worse, and discovering that no train or public vehicle ran in that direction, Mr Orme turned pale, and felt that he must either abandon his enterprise or fortify himself with more rum-and-water. Whilst he drank his second glass, the prospect of an eight miles' walk so chilled him, and the thought that ten pounds lay at the middle of it so warmed him that he was like one submitted to alternating douches of hot and cold water. At last he screwed his courage to the sticking-point, and having received full instructions as to the route he was to take, he lit his black clay-pipe and set out. Once clear of the town, the road offered pleasant going even for so lazy a personage as Mr Orme. The trees and the tall flowering hedges cast an agreeable shadow, and the grassy banks now and again invited him to sit and think. He thought about the ten pounds reward, and its magic always plucked him on to his reluctant legs again and set him going, though he always renewed the way with groanings. He was beginning to believe that the people of that district were so rootedly facetious in their habits as to set their milestones purposely apart for the deception of strangers, when he came to a decent cottage, where a woman sat upon the doorstep knitting at a half-yard of gray worsted stocking.

'Mr Snelling?' said she in answer to his inquiry. 'It's five or six score yards farther on, master, on the right-hand side. You'd see it easy now if it wasn't for the trees.'

The reward looked so delightfully near at hand that he went on quite jauntily; but, as fortune would have it, just as he left the woman with a nod of acknowledgment, Isaiah dropped into the road from a stile at a little distance, and recognising him, stood with a broad astonished stare to watch him until his balloon-like figure hobbled round the corner and disappeared. Anybody who has watched the workings of the rustic intelligence has noticed in what a curiously disproportioned way it is liable to astonishment. There was nothing so profoundly out of the common in Mr Orme's appearance in that quiet district, after all, but it hit Isaiah like a hammer.

'What's that chap want?' he asked, advancing to the woman. 'He's a stranger hereabouts.'

'He was asking for your master, Mr Winter,' the woman answered; and Isaiah stood nearly transfixed. His first idea was to run away; for, in spite of his impertinences to his employer and the immunity which attended them, he was afraid of him. It was evident at the first glimpse of things that Mr Orme could have no business with Snelling which was not associated with the boys, and Isaiah's mind shot at once to the half-forgotten reward which had been offered for their discovery.

'The fat's in the fire now and no mistake,' said Isaiah to himself; but being at bottom a man of courage, he pulled himself together in a while and marched resolutely towards the house, doing his best to look unconscious, and succeeding better than he knew. His facial expressions were less various than he supposed, and he had a kind of ox-like immobility which had been of frequent service to him in his skirmishes with his employer.

Short as was the interval between Mr Orme's arrival at the gate and his own, Isaiah found the way clear. The messenger of exposure had already entered the house. Snelling's big voice boomed through an open window as Isaiah closed the gate. 'Well,' said Snelling, 'and what might be your business?'

Isaiah, under the pressure of anxiety and fear did what he would never have dreamed of doing in less pressing circumstances; he hopped from the tell-tale brick pathway into the middle of a flower-bed, and ran with the stooping shoulders of stealth and secrecy to the corner of the house. There he couched by the open window, scarcely daring to breathe.

'I am resident in the town of Warwick,' Mr Orme was saying—'a temporary resident.'

'Well,' said Snelling, in his slow, surly, magisterial way, 'what has that got to do with me?'

'My name is Orme,' pursued the visitor, in a tone which sounded frightened and propitiatory to the listener's ears, 'Tobias Orme.' He paused, and rubbed his hands with an ingratiatory pale smile. He was not at ease before the big, sulky, domineering man. His emotions tamed the hey-day of colour in his cheeks, but his nose shone like a beacon. 'Orme, sir,' he repeated, seeing that Snelling made no reply—'Tobias Orme.'

'Well,' hummed Snelling, 'what's that to do with me?'

Mr Orme smiled fatuously and rubbed his hands. Isaiah, conscious of his own guilt, listened with a beating heart outside.

'I believe, sir,' said Mr Orme tremulously, with a roving eye in search of unprocurable stimulant, 'that some considerable time ago you issued a handbill, offering a reward for the discovery of two boys.'

Isaiah had been as certain as he knew how to be of anything that this was the object of Mr Orme's visit, and yet the proclamation of it seemed as dreadful as if it had been an altogether unexpected thing.

'Oh, that's it, is it?' said Snelling. 'What about it?'

He, at least, with that sullen, vulgarly Napoleonic mark of his, clean shaven, healthy coloured, and respectable, looked altogether unmoved. It is true enough that the wish is father to the thought with most men at one time or another; but there are men in whom desire, uncontradicted for a little while, will breed a faith which looks to themselves unshakable. Snelling was a man of this type, and his circumstances were peculiar. He had had undisputed control of his nephew's property since the death of John Vale the elder; and since John Vale the younger had run away, the land and the money he held in trust had grown into him, and become such a part of him as no honest belongings of his own could ever have been. There was nothing in the world a thousandth part so desirable to his mind as the ownership of land. Mere money wealth, the next thing in sweetness to it, was far and far behind it in its capacity for yielding pleasure. He had been gathering landed property in a small way all his life, and a half-ownership was a great sweet mixed with an incredible bitter. A mortgage was a loathing to him until he had cleared it away. A peppercorn quit-rent would have galled him. The only poetic fancy that had ever stirred his depths of commonplace came with the reflection that his ownership ran in an absolute solid wedge to the earth's centre. He bought lands with the mines and minerals thereunder, or would not buy at all, and the hidden uncomestable parts of his purchase fed his heart better than the productive paying surface. There was something so prodigiously solid in the fancy of the dark, unmeasured, unmeasurable distances, unsummed, unseen, but covered every inch by his ownership, and sealed as it were for his, whenever his foot touched the surface, if it were but of a bare bald cottage-building plot twenty yards by twelve!

As week after week had gone by after the issue of the offer of reward, and the world at large thereby appealed to had remained obstinately silent, his nephew's freehold acres had grown more and more absolutely his own. Young John had gone off to sea and had been drowned; or he had fallen sick by the way somewhere and had died. Anyhow, in one way or another there was an end of him. That had grown to be quite certain in Snelling's mind; and the appearance of the fat, disreputable, little red-nosed man, with evident news of the wanderer, was a tremendous shock to him.

Neither his face nor his voice betrayed him, but he sat in sullen dignity, chilling the soul of Mr Orme, who, without having dramatised the

situation for himself, felt vaguely that he had expected a greater show of warmth and interest.

'Go on,' said Snelling. 'If you've got anything to say, say it. You can't expect a man to sit here all the havenin' while you stare at him.'

Thus encouraged, Mr Orme proceeded: 'The boys have been resident in Warwick, sir, for quite a considerable period. Master Gregg—he was moved to a respectful tone by Snelling's aspect, and partly by the size of the house and the character of the furniture—Master Gregg has found employment in the establishment in which I am myself engaged. Master Vale works at home under the direction of a French gentleman, who is not unassociated with the fine arts.'

'Supposin' that to be the case,' said Snelling, 'how comes it that this is the first time you make any move in the matter? A reward of ten pounds has been offered for a many months. How is it as you never saw fit to earn that money till to-day?'

Mr Orme rubbed his hands and explained glibly. He had all along been sure that the boys were above the station they had taken, but he had never seen the handbill until that afternoon.

Snelling put up one hand to his double chin, and nursing an elbow with the other, fell deep into thought. Mr Orme sat and waited, wondering a little in his bemused mind, but not daring to jog the big man's memory, except by an occasional movement of the feet or a faint-hearted cough.

'It's the idiot boy,' said Snelling, waking of his own accord at length.—'it's the idiot boy, you say, as stops at home, and does something with the Frenchman?'

'The—the—eh?' Mr Orme interjected feebly. 'The——'

'The idiot boy,' said Snelling, with a sort of dogged fierceness and resolve.

'Master Vale, sir?' queried Mr Orme.

'Yes,' said Snelling.—'John Vale.—I've mean to tell me he isn't an idiot? If he isn't, he's not the boy I advertised for. He was an idiot when he ran away from home.'

'I should indeed be disposed to think so, sir,' said Mr Orme, looking round the roomy apartment and taking note of all its signs of comfort. 'A very foolish boy indeed. But youth, sir, is sometimes inconsiderate and careless of its own best interests—even reprehensibly so,' Mr Orme made haste to add with a jerk, suddenly pierced by Snelling's cold eye and made mightily uncomfortable.

'Do you mean to say,' said Snelling, bullying him with head and shoulders, 'that the lad is not accepted for an idiot wherever he may be? Openly took for an idiot? Openly known as such, and for such derided?'

'Dear me, sir,' returned Mr Orme, 'quite the contrary, I assure you.'

'Then it's not the lad I'm in search of, and you may go about your business.'

At this the visitor fell back in his seat and stared quite vacuously until the thought of the reward brought him to himself again. 'I beg your pardon, sir,' he said then, 'but the boys advertised for are William Gregg and John Vale. The names tally, the personal descriptions tally,

the ages tally. There is no doubt about these boys being *the boys*. He was almost tearful in his energy. He thought miserably of the long four miles he had walked—a desert bare of stimulant—and despairingly of the return journey.

'What's the lad doing?' Snelling asked.

Mr Orme considered, with a half-frightened eye on his interlocutor. To give too close and intimate a clue might be to set this big man on the scent. The big man looked capable of dismissing him contemptuously as soon as he had learned enough, and might then hunt up the missing boys at his ease and defraud the informer of his rightful wages. A certain aspect of reasonableness in this, providing the cases had been reversed, strengthened his fears.

'If the information,' said Snelling, appearing to divine his thoughts, 'turns out to be worth anything, you'll get your money.'

He was not in the least hurt when he supposed that his visitor suspected him of an intention to play false. Since schoolboys make a bargain, it is not unusual for each to demand a partial handfast of the objects bartered for, and Mr Snelling's methods of business were so far barbaric that he had always clung to that practice in his intercourse with the world. It was fitting and natural to suspect everybody.

'Tell me all about the lads,' he said, 'and have no fear about your money. If it's earned, it will be paid, and paid on the nail.'

Even yet, Mr Orme had some misgiving; but he saw no help for it, and so told all he knew. Isaiah, crouching outside, drank in every word, and jumped so at the mention of his own name that he set a branch near him rustling violently, and trembled with apprehension lest the sound should bring Snelling to the window.

'There's a person,' said Mr Orme, 'who visits the young gentleman occasionally—invariably upon a Sunday, sir—a country person, an Isaiah Winter.'

'Oh!' said Snelling, with a world of meaning in his tone, 'that's where he goes to, is it? Them's his relatives as lives just the other side of Hampton.'

'You know the person, sir?' asked Mr Orme.

'I know the person,' Snelling answered heavily; 'and the person'll know me afore the night's out.—Go on.'

'I have observed, sir,' Mr Orme continued, 'that there has been what I might describe as a conspiracy in the house. You may have seen the phrase in the newspapers, sir—a conspiracy of silence. It has gone the round of the newspapers, Mr Snelling. That is what I have observed in the house—a conspiracy of silence, directed against myself, sir. I believe that everybody else has been in the secret all along, but I have never been admitted to it.'

Snelling knitted his brows anew at this and dropped into his former posture. If these people had learned that young John would be wealthy one of these days, they might very well have resolved to maintain him in the hope of being paid hereafter. He had so persuaded himself of the feebleness of John's intellect that he was quite sure it must be patent to everybody. This timid fat man with the red nose was obviously a fool, and Snelling was contemptuously wrathful of his

stupidity in not seeing that John was a hopeless imbecile, and utterly unfit to control his own belongings, not merely now, but fifty years hence, if he should live so long. These other people, the foreigners the man spoke of, saw it well enough, and saw their interest in it. About that he was as well assured as if he had held the key to their souls and had the secrets of their hearts unlocked before him.

'Now,' he said deliberately, coming out of his reverie, 'I'll tell you what I'll do with you. I'm not going to pay you now for finding out what may be no more than a mare's nest; but there's five shillings for you, and you can get a comfortable bed at the *Farrier's Arms*, within half a mile from here on the Barfield Road. I'll take you up there in my trap to-morrow morning and drive you to the railway station. We'll take the train to Warwick, and you shall point out the house to me. When I've got hold of the lads, you shall have your money.'

'You'll excuse me, sir,' said Mr Orme, 'but that is a programme which does not represent itself to me at all, sir, if I may use the term. It does not represent itself to me at all, sir. For three years past I have enjoyed a comfortable home in the house of Madame Vigne; I have found, Mr Snelling, that my little comforts have been very well attended to; and to split with them would be worth more than ten pounds to me—a great deal more, sir.—I'll tell you what, sir,' Mr Orme continued with an air of persuasion, 'you cheque to-day, sir. It could be stopped at the bank on Monday morning, if my statement should not be verified by the facts, sir. I think, Mr Snelling, that arrangement would be superior to the other—highly superior. I could then return to-night, sir, and there would be nothing to associate me in their minds with your appearance.'

'If you attempt to cash that cheque,' said Snelling, 'with anybody that knows and respects my name, you know the consequences.'

He had no doubt in his own mind of the veracity of the story Mr Orme had told him, and he made out the cheque and handed it over then and there. He wrote down in his pocket-book at his visitor's dictation Madame Vigne's address, and then nodding coldly, told him that he could go. Mr Orme, not unwillingly availing himself of the permission, took up the disreputable old silk hat he wore, and dangling it by its flaccid brim, retired crab-like with repeated salutations, and edged himself obsequiously from the room.

Isaiah from his hiding-place saw him pass through the gate, and followed him with an eye to the immediate settlement of the difference which had so swiftly and unexpectedly declared itself. Snelling, unsuspecting of having been overheard, rose and tramped heavily about the room. The essence of the land he had taken for his own was in his blood and fired it like an ardent spirit. Every hour's seeming ownership had made his grip close tighter. The fallen, in his pious self-tortures, will grasp an object so long that at last he has no power to let it go, and Snelling's moral muscles had grown to a like condition. A sudden tide of desperation surged through all his pulses, and he struck the wall heavily with his clenched hand. He did not

speak a word, but he made his compact with the evil one at that moment. He would have the land by hook or by crook, his own for good and all, and was resolved to stick at nothing.

A GREEK THEATRE.

If we endeavour to form an idea of the ancient Greek theatre we must to a great extent divest our minds of modern notions respecting the stage; for at the period we propose to sketch it (450 B.C.) the Attic theatre preserved in its dramatic performances many characteristics of its religious origin in the worship of Dionysos, or Bacchus. It was national as well as religious, since the personages of the dramas were the half-mythic heroes, demi-gods, and kings belonging to the earlier ages of the Greek people, and whose history was familiar to all. The performances were rare, as they were chiefly limited to three days in the spring of the year, took place in the daytime in the open air, and were attended as a religious duty by all classes of citizens, native and alien; the state paying the two obols charged for admission when the citizen was too poor to afford them.

The principal theatre in Greece was that of Dionysos at Athens; it was for the dramatic festivals held therein that the plays of Æschylus, Sophocles, and Euripides were written, and where, in some instances, the authors themselves acted in their own pieces. The structure was of colossal size, and stood on the rocky slope of the southern side of the Acropolis, on an enclosure of land sacred to the god. It held thirty thousand people in the tiers of seats, rising in semicircular form, hewn out of the solid limestone rock, and sloping gradually to within about twelve feet of the sanded floor of the orchestra or dancing-place. The lowest tiers were apportioned to the magistrates and generals and any visitors of distinction; and the upper ones to the general body of the people; particular places being assigned to the women and the younger men.

The spectators faced the south, and those who could see over the columned wall which bounded the back of the stage must have enjoyed a noble prospect. On the left rose the flowery steep of the bee-haunted Hymettus; on the right, far in the distance, the rocky heights of Salamis; while in the centre, three or four miles off, they could see the harbour of Athens—the Piræus, with its fleets of merchantmen and warships riding at anchor in the blue Ægean, all clear and well defined in the glowing skies and pellucid air of that unrivalled clime. Considerably more than half of the orchestra was covered with a raised boarding, which was approached from the arena by a flight of steps, and having in the centre the *Thymele*, or altar of Dionysos, round which the chorus moved in the rhythmic measures of the dance and chanted their choral songs. They sang to the accompaniment of a flute, and are believed to have kept time with timbrels or cymbals, at anyrate in the more martial odes. They were under the leadership of the Choragus, generally a man of wealth and position in the city, who was charged by the state with the expense of the men and boys employed, as he furnished them with instructors,

in both music and dancing; in addition to which he acted as spokesman when required to take part in the drama. The exact position of the chorus in relation to the play is a disputed one, there being no equivalent in modern plays, if we except the *Samson Agonistes* of Milton, which was professedly modelled on the Greek pattern, and indeed is the best modern example of what a Greek drama really was. The chorus moralised on the action of the play, or expressed horror, hope, or pleasure at the deeds enacted on the stage. As succeeding poets improved on the structure of the earlier dramas, the chorus was more and more relegated to a subordinate position, as we may see by contrasting the plays of Euripides with those of Æschylus.

From the orchestra, two central flights of stairs led to the stage, which corresponded in height to the lowest tier of seats opposite. It was, in comparison with our modern stage, a mere ledge, so great was its length in proportion to its depth. Along the front, where our footlights are, was placed a row of statuettes and pilasters; a portion of the back receded in quadrangular form, and was bounded by a wall, architecturally adorned, and rising to about the same height as the columned gallery which ran round the topmost tiers of the opposite seats. In this quadrangular space there seem to have been five doors—one in the centre, and one on each side of it, facing the audience; the other two being at the corners. Through the central one, the principal actor, called the Protagonist, made his entry, and his two subordinates by the doors on either side. The scenic arrangement of the stage differed from ours very materially, as the object supposed to be nearest the spectators immediately faced them, occupying the centre of the stage or *proscenium*, while the distance was shown by painted curtains, &c., at the two sides. On the left stood the edifice—temple, palace, or house—in which the story took place; and on the right lay the open country—lake, mountain, sea, or plain.

The construction of the scenery is very much a matter of surmise; but we must believe it to have been both elaborate and ingenious, in order to fulfil the requirements of many plays that have reached us—the *Prometheus Bound* of Æschylus, for example, and all the plays of Aristophanes. There were, it is certain, spacious rooms for the construction or housing of scenery on either side of the *proscenium*, and contrivances under the *logum*, or front stage, for producing an imitation of thunder and lightning—the one being caused, we are told, by rolling leathern bags of pebbles down sheets of brass; and the other by the flashing of prisms. The whole of the stage and the elevated portion of the orchestra were of wood, and removable, as the theatre, being required for dramatic purposes only at rare intervals during the year, was also used for popular assemblies, and on other occasions when a large concourse of the people was expected.

As the dimensions of the building were so vast, it was customary to increase the stature of the actors by the use of the *cothurnus* or buskin—a kind of high boot, ornamented in front, and having a layer of soles, some three inches thick. The *cothurnus* was painted the same colour as the robe worn. In addition to

this, masks covering the whole head and face were used. On the top, over the forehead, was a lofty frontlet of conical form, which must have added considerably to the stature and dignity of the actor: inside the mask, there seems to have been some contrivance for strengthening the power of the voice to enable it to fill the immense space of the *auditorium*. Bell-shaped vessels of bronze are said to have been placed in various parts of the theatre to reflect the sound; and the actors were subjected to a severe course of training both as to power and modulation of voice. Many of the actors were men of position and influence in Attic society, and more than one had been entrusted with diplomatic and other missions. Sometimes the poet himself played in his own compositions, as *Æschylus* is said to have done. It may interest some of the craft of the present day to learn that as much as a talent (nearly two hundred and fifty pounds) has been paid to an actor of note for two performances. There were only three performers in speaking parts, the others were silent; indeed, they could not have spoken had they tried, for their masks had the orifice of the mouth closed; while those worn by the principal actor and his two subordinates were constructed with the mouth open in the shape of an O. No women were allowed to act, the female parts being taken, as in Shakespearean times with us, by boys or young men, not only on the stage itself, but in the chorus. *Sophocles*, when a youth, was selected for his grace and beauty to lead the choral dance at the festival given in honour of the victors at *Salamis*.

The dresses worn on the stage bore no resemblance to the ordinary Athenian costume, but were probably a modification of the festal robes worn in the old *Dionysiac* procession, and consisted of flowing robes of purple and yellow and other brilliant hues, crowns or chaplets, and broad embroidered girdles. These robes were so lengthy as to cover the feet, and were common to all characters, male as well as female.

When a poet desired to produce his drama, it was formally submitted to a court of judges convened for the purpose; and if it passed the ordeal, a chorus was assigned to him, and the play (usually a trilogy, or a connected set of three) put into rehearsal; the drilling of actors and chorus usually lasting a month. On the day of performance the trilogy was followed by a satirical drama, of which only one example has survived—that of the *Cyclops* of *Euripides*, so admirably translated by *Shelley*. It is conjectured that between sunrise and sunset, roughly speaking, some three or four sets of plays were performed on the three days devoted to the dramatic festival.

No play seems to have been performed twice, at least at the Athenian, which was the principal dramatic contest. If successful, the drama was probably produced at the theatres of other Greek towns in *Attica* and elsewhere. As it would have been beneath the dignity of a Greek playwright to receive money for his compositions, the victor in the contest was crowned with a wreath of ivy, which was held to be the highest honour attainable. The competitors, it must be remembered, were usually men of wealth and consideration in the state, and occupied other posts than

that of dramatic authorship. *Æschylus* was a soldier, and fought at both *Marathon* and *Salamis*. *Sophocles* attained the rank of general, and had *Pericles* and *Thucydides* for his colleagues, becoming a priest in his old age.

A Greek audience seems to have expressed approval or disapprobation in a very similar manner to that of a modern one; applauding when pleased, and hooting and groaning when anything in the play or performance offended their keen and critical taste; at times, pelting an unlucky actor with fruits, or even stones. Sometimes the author himself has come forward to deprecate their wrath or implore their patience. We also learn that the people regaled themselves during the performance with sweetmeats and wine.

Such, in brief, was a Greek theatre in the age of *Pericles*, when Athenian art and culture had reached their maximum of splendour. Of the plays, but few remain to us; and of the theatre of *Dionysos* itself, only a few broken stone steps now mark the site.

AN ALTERED PURPOSE.

IN FOUR CHAPTERS.—CHAP. I.

A CUTTING March wind, driving before it a small rain, which a little extra sharpness would have converted into hail or sleet, swept *Byerley Street* pretty clear of passengers, and furnished a good excuse, if one were sought, for two men, who walked on the more sheltered side of the road, seeking refuge in the *Byerley Arms*, a tavern which stood at an angle just where the wind and rain were coldest. This was not a 'swell' hotel, or, indeed, a high-class place at all. *Byerley Street* was a low street, and 'the *Arms*,' as it was usually called, was a low house; but a good fire was burning in its public room, and, save for one man, who sat moodily in a corner, with folded arms and half asleep, the friends had the place to themselves. They were friends, or had been so until lately, and partners in business; but divers matters had arisen, which need not here be detailed, causing much irritation, with many unpleasant arguments between *Messrs Sparle* and *Otterson*, the two persons of whom we have been speaking, and some of this unpleasantness was still fermenting in their minds.

The hot gin and water, which should have been cheering and soothing, failed in its effect; and, indeed, after a second tumbler, their conversation, which had been carried on in guarded tones, grew a little louder, and some personal remarks, which were also deficient in cheering and soothing qualities, were exchanged. It was evident that business transactions, and especially those of finance, were at the base of all this dispute, which increased in acerbity, until *Otterson* exclaimed: 'I won't have it, *Jack*!—and that is all about it. Pay me out, and I'll go. I will go cheap. As for all the stock, horse, van, and everything, I don't want them. Give

me a fifty-pound note and you shall keep the lot. Only let us have a settlement soon.'

'It is very well to talk like that, Steeve,' returned the other; 'and I don't say I will not settle with you on your own terms; but what would you have said if I had chucked the affair up as suddenly as this, and left you to find a partner where you could?'

'I leave you with all the best of it, don't I?' retorted Otterson. 'What is fifty pounds to the value of the things I am giving up? You will find a partner soon enough; perhaps you have got one ready. I don't know a likelier man than Jack Sparle for such a dodge.'

'You know a good deal better than that, Steeve,' said Sparle, who was the elder of the pair. 'You want to quarrel; but we can part without that. I do not know where to find a man; I wish I did. Men who will stick to the business, and can put in some money—although it is not much—are not to be met with every day. I would give something to hear of one.'

'Would you?' exclaimed the third person present. The interruption startled both the others, who each uttered an angry ejaculation; Otterson following this with an oath.

'You had better mind your own business, sir,' said Sparle; 'and leave ours alone.'

'I am attending to my own business, and I mean what I say,' continued the stranger. 'I have not listened purposely; but it was impossible to avoid hearing your arguments. I want something to do. Your trade, with its going about the country, will suit me.'

'We should want some money first,' interrupted Sparle, eyeing the shabby slovenly figure of the speaker, a young man of somewhat dissolute appearance, with no great favour.

'I understand that well enough,' returned the other. 'I can find some. I can pay a deposit at this moment, and find the rest easily, if your terms are moderate. Do not be set against me on account of my looks. You may have known before to-day others who were under a cloud and glad to be out of the way; that is my case.'

Each of his hearers gave a sardonic laugh, and Otterson said: 'Most of our pals have been like that at some time or another—it is a little in my way at present. But if you really mean business, we don't care about the 'cloud,' and now is your chance.'

An animated conversation followed; the first two men appearing in much better temper, and preliminaries were tolerably well adjusted at once.

The business in which the partners had been engaged was merely the travelling in the western provinces with a large van, fitted up for the sale of goods; attending fairs and races, and doing a little betting at some of the latter meetings, where they were known.

'Always on the square, you understand,' explained Mr Sparle; Mr Otterson emphasising this with an oath or two, as seemed his custom.

If the young man was in earnest—thus proceeded Mr Sparle—and liked to do business sharp, he could go and see the horse and van at once, and see people, too, who would satisfy him that all was correct. He could then pay his fifty pounds if he liked; but he was not a-coming in

for any such money, although Steeve Otterson, who has a nasty temper—I don't mind saying so afore him—may pretend he is willing to go out for that. Only that a second party was necessary, nobody should come in at all. As it was, the party would have to put down a second fifty, or perhaps a little more, according to valuation, for his share; and even that would not include the betting, for which separate funds must be provided. This is a brief summary of the lengthy explanation given by Mr Sparle, with divers interpolations by his late partner.

The stranger gave some proof of his business-like intentions by exhibiting a couple of five-pound notes. 'These are all I have,' he said; 'and I know too well that no more can be got where they came from.' His tone changed as he said this, perhaps involuntarily; but his hearers, who were among the most cunning of their class, each glanced sharply at him, and each felt added confidence, from that moment, that he did 'mean business.'

The stranger went on: 'I have a friend who will help me at once, as far as your price goes; and if I join, I will do my best for you in the work.'

'What is your name?' demanded Sparle. 'I mean, what are we to call you? I can tell well enough that whatever you give us will not be right; but we shall not argue about that. Names don't count for much with us, and all our agreements are by word of mouth.'

A curious smile, apparently in spite of himself, had moved the lips of the young man while Mr Sparle was speaking. 'I rather like your free and easy style,' resumed the stranger, after a brief pause. 'Your name, I learn, is Sparle; mine will be Frank Rodbury. Here are the ten pounds. Late as it is, I am ready to go on with the business to-night. I will see what you have to offer; and I am quite sure my friend will not mind a call from me at any hour. Will you go on?'

'You had better do it, Jack,' said Otterson, interposing. 'I can see this young fellow means what he says. I did not like his look at first; but I do now. You can take him round to the place, and I will go on to my new people. We shall part good friends, Jack, after all.'

'Perhaps we shall,' retorted Sparle; 'but I do not care much how it is. I am glad we are going to part, as you have turned out so nasty.—Now, Mr Rodbury, if you are ready, I will take you round to our place.'

The stranger rose. He was a tall, well enough built young fellow, and not bad-looking, while he wore his shabby coat with a different air from that of either of the burly fellows in his company; yet, for all that, there was a something, a slovenly dissolute something in his very look, his every movement, which told of a wasted if not a bad career.

This his new partner had early noted; but his own experience had made him, far from fastidious in such matters, and so, without further delay, he set off with Mr Rodbury in the direction of his stable and depot; Otterson parting company, having, as he declared with sufficient emphasis, something on hand which suited him book a great deal better.

It was now dark, or so nearly dark that the

street lamps were lighted, and most of the shop windows were lighted up also. In a yard at the back of a shabby terrace near the water-side, Frank Rodbury was shown a big strong horse, a large wagon or caravan, and a collection of goods.

'The things are worth more than you are going to pay,' said Sparle; 'and as a matter of fact, I am giving you the lot. It is only the good-will and the training you are paying for.—Now, come on; you shall hear something about me, and I will show you my receipts.' He took his new friend to a gay bustling public-house close by, where he seemed to be well known. Here the landlord testified to his respectability and to his solvency, avowing that Jack Sparle's simple note of hand was good to him, the landlord, for fifty or a hundred pounds any day.

'Now, I have dealt straight with you,' summed up Mr Sparle; 'and I shall expect you to be as straight in return. Where is this friend of yours, and when can you have your money?'

Rodbury intimated that he was ready to set about his arrangements at once, and said that he could make an appointment with Sparle for the next day, to settle, if that would do.—Yes, that would do very well.—'You will not object to a cheque, I suppose?' continued Rodbury. 'You can get it cashed, I daresay?'

'Cashing a cheque would not trouble me,' returned the other; 'and I shall not give you anything for it, not even a sixpennorth of coppers in change, till I know it is all right. So, if it did not turn out all right, it would be a good deal worse for you than for me.'

'I might have guessed what your answer would be,' said Rodbury with a smile. 'I will take my chance as to there being anything wrong with what I shall pay you.'

'Am I to go with you to your friend?' asked Sparle. 'I ought to know'—

'Well, you will not know!' interrupted Rodbury. 'My money will be all the reference I shall give. I have trusted you with ten pounds readily enough; so, good-night.'

With this abrupt farewell he left his companion, and went quickly off, glancing round once or twice, to make sure he was not followed. There was no danger of this, however; for, as he disappeared, Mr Sparle muttered: 'This is a different beginning in a cheap-jack business from any as I ever saw before. I wonder what my new pal has been up to? But Jack Sparle never was a spy, and never will be.'

Rodbury hurried on his errand, which led him a long way and to a very different part of London, until finally he stopped at a house in a large and respectable street in the West End, a house at which few persons of his aspect were likely to call.

The servant who opened the door to Rodbury demurred, naturally enough, at admitting such a person to his master's presence; but when the latter heard that a rough-looking man wished to deliver a message to Mr Ashwell from a gentleman, the domestic was ordered to show him in.

'You say you have a message for me,' began the master of the house; but checking himself, he told the footman not to wait; and the latter, who had hesitated at leaving such a character alone with his master, disappeared.

'Why, Cyrus! What, in the name of all that

is horrible, have you been doing with yourself?—and why do you come here now in such a guise?' exclaimed Mr Ashwell, with a total change of tone. 'Sit down, and tell me all about it.'

'No, Herbert; I must not stay long to-night; nor will I now tell you much of what I am doing,' returned Rodbury. 'What I have done, you know; and in what danger I am, you know too. I always calculated on your friendship'—

'You may, to the last!' interrupted Ashwell.

'Yes; I know it. Even as if you had been as great a rogue and fool as I am, a combination in your case happily impossible,' continued his visitor, 'and I had been—what you are, you might, I believe, have relied on me. I need two hundred pounds, in two cheques. With this I see my way to hiding myself, and leading a coarse vulgar sort of life, but one without any particular harm in it. I can have it, I hope?'

'Instantly; and I only wish I could find the means of helping you to something better than you describe,' replied his friend. 'I should like to attach one condition to this help, to which you are heartily welcome. I should wish you to let me know, sometimes, where you are, or, at any rate, how you are faring. I shall not press you further; I will leave all to yourself.'

'Thank you, Herbert,' returned the other. 'Perhaps I will do so. You will smile if I tell you I am going into business with this money; and you would smile or shudder—I don't know which—if you could see my partner. That reminds me that I should like you to make the cheque payable to a number, and sign it with initials. The London and Westminster will cash it, if you advise them.'

Without another word, Mr Ashwell drew a cheque-book from a drawer near to his hand, and in a couple of minutes the required slips were handed to Rodbury; then, with a brief clasp of the hand, the strangely assorted pair parted.

This was the commencement of the partnership between Jack Sparle, so well known, and, it must in fairness be added, so generally liked on the western road, and Frank Rodbury. The latter soon proved to be of great use in many ways, especially in betting, at which he was quicker, cooler, and 'broader' in his work than Jack Sparle, shrewd as the latter undoubtedly was. But the new partner never became so popular as the old one; he never possessed, and could never assume, a spice of the geniality of Sparle.

So Mr Jack always maintained, of necessity, the lead in the business, and Rodbury had sense enough to see that this should be so; yet, in spite of this, there was something about the junior in the firm which influenced and almost controlled his partner. Sparle felt that his colleague had not much in common with their usual associates, and he could not fail to notice that the craftiest of these 'fought shy' of Rodbury; nor did the most swaggering venture on any of the practical jokes with him which were much in favour with the class.

In consequence, perhaps, of this, Sparle unconsciously treated Rodbury somewhat differently from the manner in which he had dealt with Otterson, and with others before the latter. He could hardly be said to like his new partner better than he had liked his old ones: in fact, it was

with him a frequently recurring question, studied over his pipe and his glass, as to whether he really liked this queer chap at all. Nevertheless, as said, he could not help treating him in a different style from his predecessors, and amongst other things, he took him to his house, not to his place of business, but to his own home, where were found such family ties as he owned. These were two sisters—a girl of nineteen, and one of two or three years younger.

'I am five-and-thirty,' said Sparle, in his introduction; 'so they look up to me as a old man,' he said, 'as a old man;' but it is hardly necessary to reproduce all his oddities of speech, of which this is one of the most striking examples. 'There was ten of us,' he went on; 'but all the rest died off in two or three years; so did the mother. My governor died long before.'

Jack Sparle had been a fellow good enough to be the main support of his mother and sisters during the declining health of the former, and he was a fellow good enough still to say nothing about this to his new friend.

Rose and Matty, the two young women, were unusually good-looking, in which particular they resembled their brother Jack. Their attraction was rather of the showy 'barmaid' style, it was true; but they were attractive, beyond doubt. At first, Rodbury treated them with but slight attention, much of the trifling civility he did show being bestowed upon the younger. He was never rude or churlish; in fact, to each of these girls he seemed a cavalier of high breeding, and perhaps his conduct piqued Rose. In any case, on his recurring visits he gradually grew more conversational with her, while she undoubtedly looked forward to his coming, and, as Matty noted, and in consequence indulged in a great deal of sisterly satire, was always at her smartest when he came, and never failed to exert herself to please and entertain him.

During one of their visits to London, Sparle broke into a denunciation of the unreasonableness of women, their absurd ways, and utter want of business-like judgment. Rose furnished the occasion for this tirade, as it appeared that she had refused an offer of marriage from Bill Stakerly. 'Bill Stakerly, you know!' he repeated, with emphasis; 'a man as owns nine caravans, and could take a public for his wife, if she was so disposed any day of the week, and any week in the year, without putting his hand in any man's pocket but his own. To say "no" to Bill Stakerly!'

Sparle was unfeignedly exasperated, and held forth at great length on the enormity of his sister's conduct. The explosion probably did him good, for he seemed able to treat the matter more philosophically afterwards, and even to laugh at his own anger. But the incident made an impression on Rodbury. He was more reserved than usual, and appeared to be meditating upon some problem of difficulty.

Sparle had by this time grown accustomed to the occasional exhibition of these moods in his partner, 'who had as much learning and conversation as a lawyer or a parson, but was sometimes so cranky and silent that you could never quite tell what to have him. But a sharper fellow in the business you would never wish to see'—thus ran Mr Sparle's opinion.

He was a little surprised, on returning home one evening, after a day spent in the purchase of goods and so forth, to find Rodbury at his house before him. This was only remarkable from the latter having said nothing of such an intention. Mr Sparle was still further surprised by his partner rising, coming towards him as he entered the room, and then shaking him heartily by the hand. He opened his lips to ask the meaning of this; but a rush of mingled feelings and recollections—vague the moment before, but grown suddenly to conviction—stayed him.

Then, ere he could recover himself, Rodbury exclaimed: 'Let us have no secrecy in such a matter, Sparle! Your sister has promised to marry me, and I give the notice at the registrar's to-morrow.'

'Yes, it is true, Jack,' said his sister, in answer to his inquiring look. 'I know I offended you about Stakerly; I hope I please you now?'

'Well, I wish you luck,' said Sparle at last. 'I know you will take care to please yourself at any rate, whatever you choose to do. Well, I shall not attempt to interfere. I hope you will be happy—that is all.—I should like a little talk with you, however, Mr Rodbury, and?—'

'I expected you would say as much,' interposed the other, who had smiled cynically at the doubtful, lukewarm benediction pronounced by his future brother-in-law.—'So, Rose,' he continued, 'I must go and talk business with your brother, as I told you I should have to do.'

'I cannot see that it has anything to do with you, Jack,' said the girl, whose heightened colour gave evidence of a temper easily aroused. 'I am my own mistress.'

'You are,' returned her brother; 'and try to be so over every one who comes near you. I shall not interfere very much, you may lay long odds. Let us go round to the *Fox and Goose*; we shall be quiet there, and can say all we have to say in a few minutes.'

His partner complied so far as to leave with him, but preferred to enter on such business as was in hand without going to the hostel indicated.

Sparle asked him several questions, of a character so searching as to do his shrewdness great credit, and was answered with more or less candour.

'Now, look here,' continued Mr Sparle at the close of his questioning, 'your name is not Rodbury, is it? Be straightforward and say "yes" or "no."'

'It is not,' answered the other decisively; 'but it is the only name by which I intend to call myself in future, and the only name by which you will know me.'

'Why—but—confound it!' exclaimed his companion, 'you are not going to marry Rose under a false name, are you?'

'You know, I am quite sure,' returned Rodbury coolly, 'that such a marriage is perfectly legal if the wife did not know her husband had assumed a name. I do not fancy you will enlighten Rose; so your sister will call herself and really be Mrs Rodbury.'

'Well,' said Sparle after a long pause, 'I suppose you are right. I shall not split on you. I should get no thanks if I did. However, I will just give you a hint. Rose is a trump, and will

go through fire and water, danger or death, for a man she likes; and she likes you. But if you do not mean to act fair and square by her, my advice to you is to draw back while there is time; for if you thoroughly offend her, you had better face all the enemies you have in the world, than run your chance with her. She would never mind killing herself, or you, or half-a-dozen like you, if she once fairly made up her mind; so do as you please.

Rodbury's answer to this was a laugh, a broad open laugh; he said nothing, and there the conversation dropped, save that Mr Sparle once muttered in an undertone: 'A pretty pair they will make.'

No opposition, therefore, being forthcoming, the lovers were duly married, in a district at the east of London; in the parish of West Ham, indeed. Neither of the contracting parties lived there, so a little further misdescription was necessary, but, as Mrs Rodbury said, 'Lor! what does it signify!'

Indeed, to have hesitated then would have been, on the gentleman's part, in truth, straining at a gnat after swallowing a full-grown camel.

ROSEMARY LORE.

HERBS played a much more prominent part in the customs, the medicine, and the daily life of our forefathers than they do in the more sophisticated existence of the present day. No herb was in more universal use than rosemary. It was used at festivities of all kinds, at public entertainments, at weddings, and at funerals. It was strowed on the floor, was carried in the hand, and was stuck in the hat. In old collections of popular medical recipes, rosemary continually appears as an ingredient in wonderfully compounded 'waters,' oils, and salves. The works of the older dramatists contain frequent allusions to its various medicinal and symbolical uses. Ophelia's well-known saying, 'There's rosemary, that's for remembrance,' is but one among many such passages. In the *Winter's Tale*, Perdita, distributing her flowers, says:

For you there's rosemary and rue: these keep
Seeming and savour All the winter long:
Grace and remembrance be to you both,
And welcome to our shearing!

Rosemary was long considered a good medicine for disorders of the head; it was also supposed to clear the head and to strengthen the memory, and so naturally became the symbol of remembrance and fidelity. It is very possible that the enduring nature of the odour of the plant has contributed to its long-standing association with these qualities. In consequence of its symbolic character it was largely used in connection both with funerals and with weddings. Horace and Ovid tell us how the ancients used to strow sprigs and boughs of cypress upon the graves of departed friends; and with the substitution of rosemary, and sometimes sage, for cypress, the custom has been maintained until a very recent date. When the body of Juliet, supposed dead, is

about to be removed to the vault of the Capulets, Friar Laurence says to the distracted friends:

Dry up your tears, and stick your rosemary
On this fair corpse.

Bishop Corbet, in his poem on John Dawson, the Christ Church butler, addresses the undertaker's sable band as 'Ye Men of Rosemary.' Mrs Beecher Stowe, in her *Pogonuc People*, tells us how the rugged New-England descendants of the Puritans in the early part of this century used no flowers about their dead, only the tansy and rosemary—bitter herbs of affliction.

It was formerly customary for the mourners as they walked in funeral procession to carry sprigs of the plant in their hands, which they afterwards threw into the grave. Gay, in his *Shepherd's Week*, describing a rural funeral, says:

To show their love, the neighbours far and near
Followed with wistful look the damsel's bier.
Sprigged rosemary the lads and lasses bore,
While dimly the parson walked before:
Upon her grave the rosemary they threw,
The daisy, butter-flower, and endive blue.

This ancient custom was, until lately, still kept up in Shropshire. The sprigs were distributed to the mourners just before leaving the house, and at the same time each member of the party was helped to a 'funeral cake.' These cakes generally took the form of oblong sponge-biscuits, one of which, wrapped in black-edged note-paper and sealed with black wax, was sent to every near relative or friend not present. But they are now going out of use, and will soon be, like so many other country customs, things of the past. In Germany, not many years ago, rosemary was always used for a death-wreath for any young girl dying shortly before her wedding.

In courtship and bridal, as in death, the plant has for centuries been a popular symbol of fidelity and remembrance. Stow tells us that in the reign of Elizabeth rosemary was strown before brides on their way back from church. The gift of the herb to a man by his sweetheart was considered most significant. An old instance is found in Robert Greene's *Never too Late* (1590): 'Shee hath given thee a Nosegay of flowers, wherein, as a top gallant for all the rest, is set in Rosemary for remembrance—thou hast wonne her: els had shee not given thee this nosegay.' At weddings, it used to be the custom to dip a sprig in the cup before drinking to the health of the newly married couple. The famous Old beverage of warm ale, sugared and spiced, with a roasted crab or apple floating thereon, known as lamb's-wool, was commonly stirred with a sprig of rosemary, to give it an additional flavour. Derbyshire folk have a belief that rosemary worn about the person will strengthen memory and will give success in love. In Spain they have a proverb:

Quien pasa por romero, y no lo quiere coger,
Ni tiene amores ni los quiere tener!

which has been thus Englished:

Who passeth by the rosemarie,
And careth not to take a sprays,
For women's love no care hath he,
Nor shall he, though he live for aye!

Spaniards have great reverence for rosemary. It is related in one of their legends that the Virgin

Mary, when washing one day, hung the clothes of the infant Jesus upon it to dry. It had formerly been a very insignificant plant; but after receiving this honour, it became an evergreen and fragrant. According to Mr J. W. Crombie, an authority on Spanish folklore, it is believed that all the instruments of the Passion can be seen in its flower, and that it puts forth fresh blossoms every Friday, 'as if to embalm His holy body.' If a house be fumigated with it on the night of the Nativity, it is thought that no harm will come to that house the whole year through. Spanish peasants often wear it in their hats as a protection against witches and dangers in travelling. The practice of wearing rosemary in the hat is doubtless connected with the widespread and long-standing belief in the efficacy of the plant as a medicine for the head and brain and for the nerves generally. Edgar, in *King Lear*, describes how the 'Bedlam beggars

Strike in their numbed and mortified bare arms
Pins, wooden pricks, nails, sprigs of rosemary.

The following curious prescription for a headache is given in an old *Collection of Receipts in Cookery, Physick, and Surgery* (1759): 'Dry rosemary before the fire till 'twill crumble to a very fine powder; one pugil (handful) of saffron; and with the powder of rosemary and saffron make the yolk of an egg into a stiff poultice, and lay it as hot as you can endure it to the temples.' The oil of rosemary made from the leaves of the plant is the principal ingredient in the perfume called Hungary Water, which was formerly taken very generally to quiet the nerves. The oil is still extensively used in various preparations for the hair and head. The leaves on their under part are covered with a short whitish gray down, as if dashed with sea-spray, and it is from this fanciful resemblance that the plant is supposed to derive its name, which simply means seaweed (*rosmarinus*).

Rosemary is often given internally in cases of chronic diarrhoea, and is also a common country remedy for coughs and colds. Lyte, in his *Dodoens* (1578), recommends rosemary for fastening loose teeth; while another writer of the same period, Andrew Borde, in his *Dyetary of Healtie*, gives it as a remedy for 'palsies and for the fallenge sykenes, and for the cowghe, and good against colde.' The Plague raged in London in 1603, and so greatly was the demand for flowers and herbs affected thereby, that, as Dekker tells us, rosemary which had usually been sold for twelve-pence an armful, was then not to be bought under six shillings a handful. In Yorkshire and Lancashire, and probably in other country districts, there is a saying that rosemary only grows in the gardens of houses where the goodwife 'wears the breeches.' The same is said in Shropshire of parsley. Yorkshire folk also say that mint, on the other hand, will not grow in the gardens of the hanged.

In the old-time Christmas function of bringing in the boar's head, rosemary always formed part of the coronal of the stately dish that was ceremoniously borne to the table with musical accompaniment quaint and solemn. Scott describes the custom, with many other old Christmas observances, in the introduction to the sixth canto of *Waverley*. The ancient ceremony is still carefully

performed every Christmas Day in the hall of Queen's College, Oxford, to the accompaniment of the old carol:

The boar's head in hand bear I,
Bedecked with bays and rosemary;
And I pray you, my masters, be merry,
Quot estis in convivio.

A NIGHT IN PARIS.

ONE autumn, some years ago—how many it does not matter—Ezra L. Doleman came over from Boston to Paris to study painting. He came to sit at the feet of one of the many French painters whose public studios are thrown open to Americans and English. He was a stranger in Paris—it was his first visit to Europe—but he carried a letter of introduction to an American family, who had permanently settled there.

Ezra's knowledge of the French language was, like most of his capacities, limited, and it was with some doubt and considerable timidity that he drove across Paris, one October evening, from the Gare du Nord to an hotel in the Rue de Rivoli. It was a rainy gusty night, and the streets were nearly bare of passengers. The quarter of the city through which he passed seemed mean and squalid. The cafés were empty, their shabby chairs and tables piled against the walls, and their dripping windows mirrored in the wet. Only the *brasseries* had occasional groups of unshaven working-men, seen dimly through the clouded glass drinking absinthe at the zinc counters under a flaring jet of gas. A few stragglers, mean, half-clad, and hurrying, made passing silhouettes against the lighted shops, or battled at the corners with the fierce gusts which took them unawares from the side-streets. The whole population, Ezra thought, was of the lowest class—unlovely and sordid—not the gay, light-hearted, art-loving Parisians of literature whom he numbered among his friends. The Paris of his imagination faded before this first impression. As he bobbed his head from side to side of the cab, looking out of each window in turn, such artistic ambitions as he possessed were swallowed up in one intense longing to be back again by his beloved Hudson. He felt as if he had taken the wrong turning at a theatre, and got behind the scenes instead of into his seat in the stalls.

Ezra Doleman was a youth of quite blameless habits, whose record hitherto had only been blotted in a juvenile way; but he recognised at once that this was the reverse side of Paris life, which his favourite authors had mostly omitted, not caring to soil their dainty pages with its dirt and gloom and close contact with crime. Soon the cab rattled into brighter streets, and his forebodings vanished in the glitter of the Palais Royal and Rue de Rivoli. But this first glimpse was truly the keynote of it all. Parisian gaiety—he knew it better afterwards—is only an iridescent film of brightness, floating on the surface of a deep and troubled sea of misery and discontent. From its depths, now and then, men and women whom you will see nowhere but in Paris come to the surface with faces of terrible significance. In the narrow streets and on the wharfs they walk with the mark of evil upon them; and sometimes in the listening night there rises a sudden hoarse cry

for mercy, and next morning at the Morgue they are laying out another victim.

Within a week Mr Doleman, being an impressionable youth, had begun to reflect his surroundings. His figure was short and dapper; his head, small and square; his eyes, deep and brown; his cheeks, thin and burdened with a heavy black moustache. It only needed a French hat, low collars, and an abounding cravat, to half transform him into a Frenchman. Already he could swagger on the boulevards and smoke his cigarette and drink his *petit verre* with the best of his fellow-students. But these accomplishments were not achieved without disappointment. The pursuit of art in Paris was not the ideal thing that his imagination had seen in the pictures of Bouguereau or Millet. The *atelier* was a hot dirty shed, reeking of foul tobacco; and the models were not gods and goddesses. The students were a mixture of enthusiasts and fools, who worked and played alternately with feverish energy, or who had no brains for either work or play. It was scarcely what Ezra had looked for, and already he was not quite punctual in his attendance. But he had secured lodgings, and was prepared to settle down quietly for the winter.

This hiring of rooms had filled him with trouble. His purse was small and not heavy, and an *eloge* in Paris is not for beggars. At length, weary of bargaining, and boot-sore with tramping about the hard pavements, he had managed to secure—with out the use of the inflections of the verb—a little suite of rooms on the fourth story, in the neighbourhood of the Cluny Museum. The place was central, within the borders of the Latin Quarter, where as a bohemian he must of necessity dwell. The price was not exorbitant, and it was with a mixed sense of importance and relief that he saw his belongings conveyed up the long polished wooden staircase and finally deposited in the outer passage.

The first days passed without event. The rooms were lonely, and the evenings long and irksome. Ezra saw no one but the *concerge* on the basement floor; and after dusk, no sound broke the stillness of the tall buildings but the rare fall of a foot as the lodger above him went upwards at midnight. In the bosom of his family Ezra had been regarded as a youth endowed with musical talent, and on particular occasions had been known to accompany his thin tenor voice with the spasmodic patterings of a guitar. But he dared not awake the stillness of that lonely house. Once or twice when he had courageously touched the strings the sound had frightened him, and he had turned his head fearfully towards the echo in the empty stair and put away the instrument in guilty haste. His one unflinching resource after dark was to wrap his greatcoat about him and to sit on the balcony, which ran the whole length of the street, and there to listen to the murmurs of the lighted city beneath him. The voice of Paris is not as the voice of other cities, but has a distinctive character of its own. The rattle of the cabs is quicker and harsher; there are no street cries, but the human babel is higher and sharper; and, near and far, sounding every minute like trumpet notes, are the dull metal blasts of the tramway horns, a warning of danger in the ever-flowing tide of traffic. And then, chilled by the autumn air and dazed with

the flickering lights, Ezra would shut his window, light his pipe and lamp, and sit over his book or drawing, or his less distinct visions of future fame, until the roar of the streets had faded to a broken murmur, like the mutterings of fevered lips, and the occasional roll of a heavy wheel told him that dawn was coming with the market carts.

One night—the weather had been strangely warm for the season—Ezra went to bed rather earlier than usual. He had spent a fatiguing day in the stifling atmosphere of the studio, and was soon asleep. Like a careful youth, warned of the noxious vapours of a Paris night, it had been his habit to secure his window firmly before retiring, but to-night sleep came to him unawares, like a blessing, and the window was left unfastened. Soon after midnight he awoke uneasily, and, in the moment of awakening—that odd moment of blended dream and actuality—he heard a sound outside his room. In his dreams it had seemed a footstep on the stair, and now, to his waking sense, it was a cut-like tread at his window. During these early hours it had fallen to rain, and though the wind lay silent, the wings of the casement had burst ajar. But the long catch still held them in position, and through the opening Ezra could see the dark fields of cloud across the sky, and the wet moon that shot a sickly arrow on the wall.

Over the lower part of the opening a heavy shadow fell—the shadow of a crouching figure. Ezra lay quite still, watching and listening, but cold to the marrow, with a trembling that shook the bed. At last, when he could pierce the darkness, when he could follow out the lines of window and balcony, he saw with terror that the fastening had been released, that the shadow was gone. Yet the window stirred not, though both sides were free. If no human hand was there, the draught should have swung them wide. Then suddenly, with a cautious creaking noise, there was a larger opening, and the watcher could see more space of drifting sky. Whatever its purpose, the figure was in the room—still and dark as a dead thing—lying closely in the shadow of the wall. The perspiration stood on Ezra's face; he knew not what to do. To challenge were but to court a quick attack. The Paris rough, dexterous with the knife, goes nowhere without his weapon. The poor student was unarmed and undressed, alone at the top of an empty house. A moment's struggle and he would be pinned like a beetle in an entomologist's case. He had taken off his courage with his clothes. In his trousers, Ezra would have felt himself a lion; without them he had the timidity of the hare, with the hare's inveterate tendency to flight. Nay, had it not been for very shame, he would have given up both watch and purse and begged his enemy to begone. But even this required courage, and he had none. What little had remained to him after undressing had since oozed into the sheets; so he lay still and watched and waited.

His visitor was a deliberate man, and for some minutes he heard no sound but the noise of the close rain upon the balcony, and he might almost have fancied that his senses had tricked him. But slowly to his nostrils there grew a familiar odour—a sickening blend of tobacco and garlic—the characteristic flavour of a French workman.

Down on his face on the floor the man was creeping like a reptile, shunning a gray space of moonlight that just missed his head. Ezra's nerves jerked painfully; his mouth was parched; his body, chill and damp as a frog; but he lay without movement and tried to counterfeit the heavy breathing of a sleeper.

I do not know that those moments, like the last moments of a drowning man, were filled with the recollection of all the frivolities and guilt of his flowerless youth; but he certainly had much time for such meditation, for there was soon another long interval of silence. Even the rain had ceased, and the wings of the night were closed in slumber. Then faintly came the sound of material things dragged upon the floor. The man was hunting through the garments on the chair beyond the bed. It shocked Ezra to think that the search there was to go unrewarded, for his pockets were innocent of anything but sous. His watch was on the mantel-piece, stopped for days, and unable to betray itself; his purse he had deposited with his usual precision beneath his pillow. Clearly the chase was coming closer to his person; and even at the risk of death, he must make an effort to save his money. So, slowly and with exaggerated caution, whilst the other was still busy with his trousers' pockets, he reached his purse, and then, inch by inch, pushed it down among the bed-clothes till it landed at his feet. Personal danger was new to him—it had taken him unawares; but he had always been of parsimonious instincts, and the rescue of his money called up only the exercise of a familiar habit.

It was an odd situation. An empty wet street, glimmering with feeble gas-light, and noisy at intervals with the splashing rain; and a narrow room high above it, dark and silent, but full of a drama with the end yet unwritten. And Ezra's moments of sorest trial were now at hand. Lying on his left side he faced the window, and between it and the bed there was a space of blackness on the floor—a dark unknown land in the shadows of the room. Peer closely as he might, he could not see; but somewhere in its depths—the watcher knew by instinct—a dark figure was creeping nearer. The awful stillness was ominous of something more. Suddenly, without sound of warning, before Ezra could shut his eyes, the man was close upon him. With a gliding action, like a snake about to strike, he reared his body from the ground, and his face was within a foot of Ezra's nose. He could feel the hot fetid breath with sickening force. The impulse of the moment—it was a purely feminine and hysterical impulse—was to scream wildly and strike out madly at the horrid thing. Perhaps, had he done so, in the fear of sudden attack the intruder might have fled. Had Mr Doleman been a man of any force of character he would have made one supreme effort to seize his foe; but he was only a youth of a somewhat disordered imagination—a mere bundle of shattered nerves—in mortal fear for his life, so to his assailant he left the development of the episode, and lay quite still, with the sheets clinging about his moist limbs like plasters.

In the passing moment he had seen a face, terror-stricken like his own; a gaunt, wolfish head, thin and eager—an expression trembling on the brink of reason—and framed in a mass of dark tangled hair. The vision of this black crouching thing

bore on him like a weight of lead, so that he could not move; only his hair seemed to creep upon his skull, and his heart bounded like a ball. If his visitor had set a light beneath his very chin, the wretched youth could not have stirred hand or foot. He kept his eyes fast closed, and even in this supreme moment of danger his presence of mind came back to him like a memory, and he succeeded again, with something approaching to genius, in breathing regularly as a sleeper does. So the two remained face to face for a few never-ending moments of stillness; the one scrutinising the other closely, for Ezra still felt the offensive breath upon his cheek. And then a great hand, but bare to the bone as a claw is, was stretched out warily and gently sought below the pillow. Stealthily it searched, backwards and forwards, here and there, a cold stab, almost of pain, touching Doleman's heart each time he felt the dragging hand below his head. Already he repented that the purse was at his toes. Better far that it should have been there to satisfy the robber's greed, and that he might have gone filled with plunder rather than with the revenge begot of failure. At last the hand was withdrawn regretfully, and something like a sigh escaped the figure as it slipped once more to the floor. Ezra on his side drew also one furtive little sigh of relief. Then silence again—a silence longer than any before—broken only by a ghost-like fall of plaster in the wainscot, and the footstep of a late guest on the pavement far below.

Where was his hateful visitor? Gone, or going, or planning further villainy? Surely he would not go empty-handed. Ezra opened one eye with caution, as though it were an action that might be heard, and watched the window as before. Black clouds had come upon the rising wind and veiled the moon, and the room was darker. He could only see the opening vaguely as a grayer shadow; but the keen draught that now blew shrilly was still laden with the odours of his visitor. He began to realise that his powers of endurance were about exhausted. This last hideous silence, after what had gone before, was in truth unbearable. He must cry aloud, even at the hazard of his precious life. But a time came at last, after more waiting, when the crouching shadow was at the window once more; and then silently as ever, like a spirit, the thief had passed, and was gone into the blackness of the night.

A great weight dropped from the soul of Ezra Doleman—his albatross had fallen from him—but he felt faint and weary and sore, as though he had been soundly flogged. He dared not yet rise and shut the window. When it occurred to him to ring for aid, the thought possessed him that he was in a den of thieves and his bell might only summon another enemy. So for hours he lay, his head buried far in the blankets, the victim of a thousand morbid fancies. It was nearly dawn when he arose, with the murmurs of the awakening city in his ear; and, shivering and stumbling like a drunken man, his scanty night-dress blowing in the raw morning air, he at last closed and locked the fatal window. So the night ended, and the morning looked in upon a careworn, fevered youth, who had safe-guarded his belongings at the cost of his self-respect.

Ezra is still in Paris, studying art, but he has

taken apartments at a respectable hotel, much affected by Cook's excursionists, and on the days when he does not attend the studio—and they are frequent—he devotes his mind to the study of the English aristocracy on its travels.

ABOUT ELEPHANTS.

THE elephant may well be considered the head of the menagerie. Young and old are never tired of watching these wonderful creatures; they are so knowing, so loving, yet so terrible in their anger. An elephant can tear off huge branches of trees with his trunk, or stamp the life out of a tiger with his great feet; yet the same trunk can be trained to pick up a pin, and the mighty feet to tread gingerly over the recumbent forms of sleeping or intoxicated keepers. Strange as it may appear, an elephant's skin is very sensitive; mosquitoes annoy him greatly, and a beating is a terrible punishment for him. Courageous as he is, an elephant is very nervous. He will fight any other huge beast, yet a mouse is said to make him shake with apprehension and trumpet with terror.

Elephants are very mischievous and inquisitive: they raise latches, open doors, and enjoy immensely their own practical jokes, though so ready to resent indignities to themselves. Sensitive as regards insult, their affection is warm and lasting, and dogs, horses, and other animals are often the objects of their attachments. Elephants are pleased with gay colours, delight in sweet perfumes, are dainty in their tastes, and revel in the water like an Englishman in his bath. They practise theft with the ingenuity of the 'Artful Dodger' himself, are as meddling as monkeys, have the caution and cunning of a diplomatist, and the memory of Magliabechi.

When born, a baby-elephant stands about three feet high, and is not considered grown up until thirty years old. Accidents excepted, he is likely to live about one hundred and fifty years, if not longer. Though delicate in his tastes, an elephant likes quantity as well as quality, and at his meals makes nothing of bales of hay and gallons of water. His ingenuity in trying to cater for himself is astonishing, and often amusing. An American showman saw an elephant pull up a stake to which he was chained, 'go to a feed-bin containing oats, wrench off the lock, raise the lid, eat all he wanted, put down the lid again, return to his place, poke the stake back into the same hole, and stamp it down with his foot, and when his keeper came, look as innocent as a lamb.' A twinkle in his cunning eyes showed his enjoyment of the situation when the man stormed and raged on discovering the robbery.

An incident of an elephant's memory is said to have occurred some years since when Wombwell's menagerie was exhibiting at Bolton. Four years before, the same collection was in the town, and on that occasion, on being released from its van, a large elephant walked across the town-hall square to a public-house and protruded its trunk into the lobby. The barmaid supplied the animal with refreshments; and the keeper, who had been in search of his charge, then conducted him back to his den. On being released at the breaking-up of the show on the second visit, the same elephant

broke away at a brisk trot in the direction of the hostelry, and the unwonted charge upon the premises greatly alarmed the inmates. The former barmaid, now the landlady, arrived on the scene, and recognising her old friend, once more regaled him to his heart's content. The elephant then submitted to be led away by his keeper.

Their sagacity is indeed marvellous. In an Indian town, an elephant, during his keeper's absence, was one day amusing himself with his chain in an open space, when a thief, who was pursued by a crowd of people, ran for protection under the huge animal. Seemingly pleased with the poor wretch's confidence, the creature instantly faced about, erected his trunk, threw his chain in the air, and became so furious in defence of the criminal, that neither the surrounding multitude, nor even the mahout, to whom he was greatly attached, could prevail with him to give up the hunted man. This strange scene had continued for several hours, when at length the governor arrived, and was so pleased at the elephant's generous perseverance, that he pardoned the criminal. The poor man expressed his gratitude by kissing and embracing the proboscis of his kind benefactor, who appeared so sensible of what had happened, that he became tame and gentle in an instant, and suffered his keeper to lead him away without the least resistance.

In America, no circus, however small, could hope to exist without an elephant. Whole herds form parts of some shows there; and the eagerness of Mr Barium some years ago to obtain a white elephant is easily understood, seeing that one is considered worth all the other attractions in the country put together.

Although elephants will not submit to abuse, they are not difficult to teach, and at first are fond of going through their tricks on their own account. Performing-elephants in Rome were taught to dance to the association of music and a hot floor. A block and pulley is now sometimes used in training an elephant to assume various positions, and the word of command given as if it was doing the trick of its own accord. Good treatment with firmness is necessary in teaching them, and any rebelliousness must be checked by the whip. They cry out when subdued, and the trouble is then over for the time. Even wild elephants are said to be easily taught when once subdued. Most of us have admired the wonderful agility of such clumsy-looking animals in balancing themselves on inverted tubs and so forth. At Astley's, elephants used to delight thousands with their performances. These huge creatures were made to stand on their hind-legs with their forefeet poodle-wise dangling in the air. Another stood on its head with its hind-legs raised perpendicularly. Placed on pedestals, they wheeled round rapidly, or balanced themselves on two side-legs only, and gave various other evidences of wonderful training. Well-trained baby-elephants are great favourites. One was taught to sit at table, fan herself, and do numerous tricks to delight children and their elders too. The two clever baby-elephants 'Jock and Jenny' were marvellously trained. They made their bow to the audience, and then one of them walked on the tops of a double row of bottles. On a plank placed over a trestle they saw-sawed like a couple of children, guessing the required equilibrium with almost human exacti-

tude. Playing on an organ and drum, and dancing in time to the jingles of bells, were amongst their other accomplishments.

The habitual caution of these intelligent creatures is illustrated when they are travelling from show to show. Should several be in a car together, one of their number will remain awake on guard while the others are sleeping. Some years ago, experiments were made in the transport of elephants by railway. One of the ordinary cattle-wagons of the East India Railway was fitted up for the purpose, and the animal was placed in the centre space of the wagon, between six shafts, a breast and back bar, and secured in addition by anklets on the fore and hind feet, united by couplings transversely and longitudinally, and further by four diagonal mooring chains passing through holes, and lashed round the corner pillars of the wagon. The first elephant loaded, having his head free, took the opportunity to remove with his trunk a portion of the roof of the truck; it was therefore found necessary to put a collar round the neck of the elephant, with a vertical chain leading through, and secured to the floor. In this way a successful experiment was made to Pundooah and back, the animal showing no signs of fear, or making any attempt to free himself.

Many interesting and famous elephants have been favourites of the American circus-going public long before the late Jumbo's successful debut. One of these, known as 'Canada,' was a desperate character. When in one of his tantrums, 'he did as much mischief as a tornado,' to use an American showman's words—tossing hacks into the air and tearing down signs and lamp-posts. He was sent with the rest of a menagerie to a farm, and when there, had one of his mad fits. Rushing into the stable-yard, 'in a few minutes he killed two buffaloes, a sacred cow, a couple of elks, several horses, and a camel. He would seize an animal, toss it in the air, catch it on his tusks, and then either jam or trample the life out of it.' He then sallied out for the town, and the popular excitement can be imagined. 'A trap was set with a long ponderous chain with an enormous corner-stone at its end to entangle the animal's legs and hold him.' A man then ran out in sight of Canada, and the elephant instantly rushed after him. 'The trap was successful so far as making the chain and stone fast to him, but he kept right on, and would have caught the man, who was a fast runner, had the latter not jumped down into an unfinished cellar of a new house, and ran up a narrow flight of steps on the opposite side. The elephant jumped down after him as easily as a dog would, with the big stone clattering behind him.' Fortunately, the stone was large enough to stick wedged against the walls on each side of the stairway, and Canada was fast; but it was a close shave for the man. They managed to secure the savage animal with more chains, and then went to work to conquer him. As the account graphically describes it, 'they wore out big clubs on him, fired loads of buckshot into his trunk and ears, and beat and tortured him for hours until he howled in token of surrender.' The moment he was loose, however, he gave a yell of rage, dashed out of the cellar, and started to kill. Every one flew for his life; but he was fired, and took up his position under cover of some haystacks, hunting all who ventured near

him. 'Buckshot fired into his head only checked his wild rushes, and whenever he thought people were on the other side of a stack from him, he tried his best to topple the hay over on them. The fight went on for three days and nights, during which time he had not a bite to eat—for he was too angry even to take any of the hay around him—and not a drop of water.' At length, despairing of saving him, the shot-guns were exchanged for heavy rifles, and several big bullets at close range finally put an end to him.

The interest in Jumbo, the Zoo favourite, was subsequently transferred to Mr Barnum's so-called white elephant, which, in spite of generally expressed disappointment at its appearance, and doubts as to its 'sacredness,' attracted thousands of people in London, and was also viewed by still greater numbers in America.

The first live elephant seen in London was in the reign of Henry III., and the citizens closed their shops and donned their holiday attire in its honour. King James I. had a private menagerie in St James's Park in which was kept the elephant presented to him by the king of Spain. It cost some hundreds a year to keep this animal, besides 'the wyne he must drink from April to September, a gallon the daye.' Another celebrity was the huge elephant 'Chunee,' whose tragic end during a strange attack of mental aberration kept all London in a ferment for several days. If we recollect aright, a show-elephant in London was the mother of the first elephant born in captivity. A large elephant weighing heavier than Jumbo, though not so tall, was recently on view in Liverpool, where there was quite a run on his photographs.

Elephants being so powerful and intelligent, are worse than any wild animal when in one of their sudden fits of ungovernable rage. The amount of killing they take is incredible. Heavy rifles that kick tremendously often have little effect in stopping their wild charges, and in one instance, in India, even a fieldpiece fired repeatedly failed for a considerable time to put an end to the career of a mad elephant.

NEVER FORGET.

Never forget. May the clouds never come

'Twixt the gazer's eye and the dream above.

Oh, ne'er may your heart to my pleadings be dumb,

Or fail to respond to my message of love.

And ne'er be that forehead enveloped with care,

That over thy life shall its sorrows beget;

May the fragrance of memory ever be there.

Oh, never forget, love, never forget.

Birds build their nests where they built them last year;

The young love the places long hallowed by old;

And longing is deeper and love is more dear,

Where Memory's river does never run cold.

Oh, look to the sun at the dawn or the setting;

Bask in the beams that its courses beget;

Then, though all life may be doomed to regretting,

Oh, never forget, love, never forget.

NEGLECTED FRUITS OF THE SEA.

THE poorer classes excepted, English people generally seem strongly prejudiced against many articles of food which are consumed by continental nations even at the very best tables. A random glance at the *menus* of first-class restaurants abroad would afford ample proof of this fact, if any were needed. And, curiously enough, no sooner do our countrymen set foot on foreign soil, than they willingly and freely partake of what at home they would turn away from with disdain, if not disgust. The method of cooking these so-called objectionable viands adopted in the *haute cuisine* may have something to do with this circumstance; but considering that nowadays our cookery, except amongst the lower ranks of life, will compare favourably with almost any country in the world, it can scarcely account for it entirely. No; blind prejudice alone, it is to be feared, mainly deters us from turning to good account many an excellent article of diet.

Take, for example, one phase of the question, that of shellfish. Beyond oysters, lobsters, crabs, prawns, and shrimps, we seldom find any crustacea presented in ordinary every-day fare for our delectation. Yet there are many other species which, if properly treated, yield most nourishing and attractive dishes. Some of the cheapest sorts of shellfish which abound on the coasts of these islands offer opportunities for the exercise of refined cookery, and find their way abroad to the tables of the most fastidious.

To begin with the simplest and commonest, the humble shrimp. Here, it is chiefly associated in our minds with bread and butter at breakfast or tea, when we are at the seaside—or in the sauce served with boiled sole or turbot. But as travellers in France, Belgium, and Italy can testify, the shrimp is often, amongst other methods, stewed with cream and lemon peel, enclosed in a casket of flaky pastry, and lightly baked. An enthusiast has lately written that 'to have eaten of one of these shrimp pies thus prepared is to have known a gastronomical bliss not readily to be forgotten.'

The same writer adds: 'The mussel, too, which we rudely boil, as though it were a mere carrot, and serve up swimming in its diluted juice, is sympathetically treated by French chefs, who dress it in many ways, tempting to the eye and exciting to the palate. We find *moules au vin blanc*, steeped in a pale delicate sauce, faintly flavoured with Graves or Chablis; *moules à poulotte*, a cream *fricassée*, fragrant of thyme and marjoram; *moules à la marinière*, the thick sauce of which is redolent of sweet herbs, and resembles the quality of mercy in that it is not strained; mussels cooked *à la mode de Bordeaux*, their gravy being dark, rich, and slightly flavoured with tarragon and garlic; and many other preparations of the beautiful blue bivalve, which have conferred well-merited renown upon certain specialistic Parisian restaurateurs.

In Italian seaport towns, notably in Venice and Leghorn, the cockle, the winkle, the whelk, as well as many another plebeian marine creature included in the generic term *frutti di mare*, or sea-fruit, are often exquisitely cooked by perambulating artists, and eaten at the second breakfast of many highly respectable Italians. It is customary in some of the open-air restaurants of the cities alluded to for a purveyor of 'sea-fruit' to occupy a corner of the garden in which the clients take their meal, and to dispense cheap portions of his stew from an ever-simmering caldron, fixed in an iron frame over a charcoal fire.

The attractions of cheap molluscs have yet to be developed, and few of those who consume them in abundance have the least notion how appetising they may be rendered by intelligent preparation for the table, or how many inexpensive ways of dressing them are familiar to the ordinary domestic cook of Southern Europe. Down to the present time, however, English cooks in their professional relations with bivalves have not risen above stewed and scalloped oysters, and are curiously conservative even in their manipulation of fish generally. In all probability, there is not a restaurant or club dining-room in England's vast metropolis at which it would be possible to procure a dish of *bouillabaisse* or a plate of *borrach*.

soup, although these delicacies—of which fish forms the chief ingredient—have been household words in France and Russia respectively throughout this century. It is much to be regretted that, surrounded as we are by the sea, we do not turn to better account the good things of which our teeming liquid girdle is so lavishly profuse to us.

Nearly every one of the inferior crustacea and molluscs—what the fastidious among us would term unwholesome, coarse, if not highly objectionable food, only fit for the roughest tastes and strongest digestions—are rich in phosphates, and contain an enormous amount of nitrogenous elements—very essential nutrition both to body and brain. Doubtless, a vague notion of this fact is prevalent, and there certainly is a natural inclination on the part of our population, especially in inland towns, to partake freely of everything which smacks of the sea. The saltish ozone-like odour which rises from the oyster-stall or the costermonger's barrow seems to have a peculiar attraction for the multitude; whilst shrimps, when offered for sale by any fortunate accident in a rural district, go off with amazing rapidity.

Yet, as a rule, how difficult it is, except for the residents on sandy coasts, to get anything like an adequate supply of this common yet toothsome 'fruit of the sea.' In a perfectly fresh state it is almost as great a rarity as pine-apples, sometimes a greater. Even on the outskirts of London, in which metropolis it is supposed everything can be bought for money, we cannot ensure a dish of fresh shrimps under twenty-four hours' notice. This of course arises in the first instance from the contemptuous way in which, from its cheapness, the shrimp is regarded by the fishmonger as well as his customers; and in the second, from the delay with which it is transferred from Billingsgate to the remoter districts where it is retailed. Of course we know the little comestible deteriorates rapidly when it is once boiled. There is not much difficulty, however, in detecting the freshness of the shrimp; and as a guide to discovering this, the expert above quoted aptly says: 'When quite fresh, its flesh is firm, pink, and delicately scented with a subtle marine perfume, whilst its brittle brown armour is easily removed by a dexterous twist and pull, revealing a delicious morsel to the complacent eye of the operator. A few hours' sojourn in bag or basket, ere it reaches the marble slab of the retailer, changes the shrimp very much to its own disadvantage as well as to that of its consumer. Its body becomes limp and flaccid, its scent acquires an oppressive and indomitable force.'

Nevertheless, it will be eagerly secured so long as it is in anywise eatable. The same thing may be said of the periwinkle, if it be permissible to mention such a plebeian mollusc. Also we refrain from saying anything respecting the whelk or the cockle; but in justification it can be repeated that these neglected 'fruits of the sea' are not only tolerated abroad, but are made to do efficient and wholesome duty as food for man, to the edification and advantage of high as well as low, the cultivated and refined, no less than the untutored. In reality, our taste as a sea-loving people inclines towards shellfish, though we do not know how to cook them invitingly; but if we could introduce more varied methods of treating

them, the tables of the rich, to say nothing of those of the poor, would frequently present grateful surprises in this direction.

These suggestions are offered in the hope that they may attract the attention of those who have the superintendence of such matters, especially in the numerous schools of cookery ostensibly established for the benefit of the masses. We do not profess to supply any practical details as to the precise methods of cooking and serving these minor tributes from the ocean; but doubtless there is no lack of the requisite knowledge now to be found in England amongst at least the higher class of *chefs* who regulate our fate dietetic.

Probably a host of excellent foreign recipes would be immediately forthcoming, if our demand were made evident, and if we could only overcome our prejudice against the common and the cheap.

JOHN VALE'S GUARDIAN.

CHAPTER XVI.

MR ORME, with a joyful tremor in his mind, fumbled with thumb and finger at the cheque in his waistcoat pocket. It was drawn, as he had already observed, upon a Birmingham bank, and he promised himself a sweet Saint Monday, the morning of which should be devoted to a journey for the purpose of cashing that valuable strip of paper, and the afternoon and evening thereof should be given over to manifold pleasures, among which rum-and-water and the theatre shone conspicuous. He was just entering the gilded emporium of Messrs Moses & Co. in the free realm of fancy, bent on refurbishing himself from head to foot as a preparative for the pleasures of the town, when Isaiah walked up beside him. Mr Orme looked round a little startled, and fastened the single button which remained on his shiny old coat as a protection to the cheque.

Isaiah's aspect was enigmatical and perplexing. By way of salute he gave a nod which might have meant anything, and to Mr Orme's imagination suggested mischief. The two knew each other perfectly well, and had been accustomed to exchange salutations when they met. Mr Orme's guilty mind alone made him uneasy, for he did not so much as guess that Isaiah had overheard his treason. Even if he had, the treason was at its most a very small one, for Tobias was in no way bound to fealty, and could not reasonably be supposed to break a bond into which he had never entered. But Isaiah walking at his side, with that unchanging countenance of enigmatical meaning turned constantly towards him, filled him with distinctly uncomfortable sensations. He began to wish that at Isaiah's first coming he had found presence of mind to salute him. It was eminently awkward not to do it now, but he felt that it was too late, and that any greeting he might offer would sound forced and unreal. He shambled on, therefore, feeling guiltier and more openly detected every second; and Isaiah twisted the sidelong enigmatical accusation into him relentlessly, as if it had been a gimlet.

By the time a hundred yards had been covered in this comfortless fashion, Mr Orme had begun to feel that the position was downright intolerable,

but he saw no way to mend it. To rid himself merely for a moment of Isaiah's intrusive eye, he made an elaborate search for his pipe, and having found and lit it, went on with as good an air as he could assume of being unaware of his companion's neighbourhood. But Isaiah stretching out a deliberate hand, possessed himself of the pipe and threw it over the hedge. Mr Orme's soul quaked within him at this open declaration of hostilities, but he was too fond of peace to resent it. Whether in the hope of rousing Mr Orme to war, or simply from a desire to relieve his own overwrought feelings, Isaiah sent the flabby silk hat after the pipe.

The victim groaned feebly, and climbing over a stile, made a silent search for his missing property, whilst Isaiah watched him from the road. Still uncomplaining, Mr Orme returned, and resumed his journey with Isaiah at his side. He walked all the dreary four miles and more which led to the town, and Isaiah kept him in voiceless company. When they passed the dram-shop at which he had refreshed himself in the afternoon, he felt in such urgent need of comfort that he made an effort to enter it; but Isaiah, skipping nimbly round, intercepted him, and sent him onward by a single significant gesture of the thumb. The victim groaned again, and shambled dismally towards the railway station, his unwelcome companion still clinging to him.

'Got your ticket?' said Isaiah, breaking silence for the first time.

The wretched unresisting little fat man nodded. There was a moist appeal and terror in his eye which would have moved a soul less sternly set than Isaiah's. His persecutor took him by the arm as if he took him into custody, and led him to the window of the ticket office.

'Third-class for Warwick,' said Isaiah.—'That's where we're going to, ain't it, companion?'

Mr Orme in a scarce audible murmur answered that he supposed so; and Isaiah, who had taken an unexpectedly facetious air, led him to the platform. When the train came up he bundled him into the carriage with an exaggerated helpfulness which Mr Orme felt to be more cruel than open violence; and all the journey through Isaiah sat on one side of the carriage smiling forebodingly at his captive on the other. When the dreadful journey was over, he took him into custody again and led him homeward. There was no room in the mind of the miserable Tobias for further doubt. And he, who had never felt particularly courageous towards anybody, unless towards a boy of exceptional delicacy and cowardice, had never dreaded anybody as he dreaded Madame Vigne. He knew now beyond hope of error that he was to be ushered into that lady's dreadful presence, and to be exposed there as one who had attempted to wreck her plans.

Isaiah's knock at the door was answered by Madame in person.

'What is the matter?' she demanded severely, recognising her lodger in the dusk. 'You have been misbehaving yourself again; you have been drinking. I told you last time that I would forgive you no more. Go to your bed, and on Monday you shall leave. I will have my house respectable.'

'I don't think he's been drinking much this time,' responded Isaiah.

'It is you, Mr Winter,' cried Madame, in a tone of surprise. 'Come within-doors. What brings you in Warwick on a Saturday?'

Isaiah, gripping his captive more firmly, struggled with him through the doorway, Madame recoiling in surprise before them. In the little parlour Jousserau and Vigne sat playing at chess together. The boys were sitting at a side-table, John drawing, and Will leaning over his shoulder. Everybody looked up as Isaiah and Mr Orme came tumbling clumsily in together; and when Isaiah knocked his captive's hat off and forced him into an armchair with unnecessary violence, they all stared in astonishment. Madame had delayed a moment to close the street door, and entering in time to catch Mr Orme's hat in her arms, stood amazed.

'What is the matter?' she exclaimed.

'This is the matter, mum,' returned Isaiah. 'This gentleman—this nice old gentleman—has been to Castle-Barfield. What's more, he's been to Beacon-Hargate. What's more, he's been to see my gaffer, old Bob Snelling. And what's more,' Isaiah continued, by this time in the highest conceivable state of exasperation, 'he's sold the lot of us for a cheque for ten pounds, and he's got the paper in his pocket at this here very instant.' With that he began forcibly to fumble Mr Orme, as if with intent to rob him of his gains; but Madame intervening, her husband and the young artist rose together to her assistance; and the three, interposing between the victim and his assailant, made so loud an inquiry that for a minute there was no understanding anything. Mr Orme sat quiet, with an anxious eye. He directed his glance once toward the door; but the observant Isaiah precipitated himself in that direction, and closing the door with a loud bang, set his back against it.

'Now,' said Madame in rapid French to her husband and the artist, 'what is the use of everybody talking at once? Leave him to me, and let me find out what has happened.—Tell me quietly,' she continued to Isaiah; 'let me understand.'

'This party,' said Isaiah, scornfully indicating Mr Orme, who sat in the precise position in which he had been placed and made no attempt to depart from it—'this party has been to my master's house at Beacon-Hargate, and I heard every word that passed between 'em. He told my master that we was all in a plot together to keep the boys away from him. He mentioned me as a visitor here every Sunday. My master's coming over by the first train to-morrow morning, and he's given this fellow ten pounds for the news.'

Madame, translating this intelligence for her husband's benefit, M. Vigne stood by for orders, reserving his opinion of Mr Orme's conduct until his wife should express her own. Madame's views were always good enough for Monsieur, and he made it a sort of point of honour to have none of his own until hers were clearly set before him.

'I am sorry,' said Madame, shaking her head reproachfully at the traitor—'I am sorry to hear these things of Mr Orme. He has been kindly

treated in this house these three years, more kindly treated than he has deserved. He has not deserved it, and he knows it—well. Oh, right, right well he knows that he is not deserving.

Mr Orme looked vacantly in many directions, but forbore to encounter any of the glances fixed upon him.

'He knows,' Madame continued, with a theatrical gesture of the right hand, before which Mr Orme blinked feebly, in anticipation of physical violence—'he knows that the children were kept here because they had been vilely ill-used at home. He knows that whatever has been done here has been done in kindness and at our risk. He knows'—Madame was going on at a great rate, and had grown quite parliamentary in accent and in gesture, and was turning from right to left, to impress her audience with a sense of Mr Orme's enormities, when her eyes lighted suddenly on John's face, and her eloquence was stayed in mid-torrent. The boy was white and terror-stricken, and the old look of bewildered vacancy, which nobody had seen now for half a year past, was on his face again.

'N'aie pas peur, mon enfant,' she said, in a tone suddenly grown soft and caressing, as she ran to him and put her big motherly arms about him; 'thou shalt come to no harm.'

'My cherished,' said M. Vigne, 'you are right, as always; but what is to be done?'

'We will talk it over between ourselves,' Madame returned.—'Achille, mount guard over that infamous, and do not permit him to leave the room.—Come with me, M. Vintare. Come with me, my children. Come with me, my husband.'

She swept out her brood before her; and turning back from the door in the very act of closing it behind her, bent a look of anger and contempt upon Mr Orme, and suddenly snapping her thumb and finger under his nose, in token of unspeakable derision, caused him in the suddenness of his recoil to strike his head with some violence against the mantel-piece near which he was seated.

'Oh!' said Madame, 'you disgraciously, you thankless, you good-for-nothing old man!'

Mr Orme said nothing, but explored his waistcoat pocket to make sure his cheque was there. The action was mechanical; but the touch of his thumb and finger on the paper awoke him to the fact that by to-morrow morning the document would have grown worthless to him. At this reflection he gave a sudden whimper, and Madame, with a new snap of her fingers, swept from the room.

Jousserau, having first locked the door, sat down facing the frustrated informer, and producing a sketch-book from an inner pocket, began immediately and with an intensely business air to translate his lineaments to paper. Mr Orme, fretfully resenting this, and feeling as if it were an undeserved indignity, turned away; but the artist, rising from his seat, and laying down his drawing materials, rearranged him as if he had been a lay-figure, and cautioning him with a forefinger, resumed his place and his occupation.

'You are nice man, eh?' said Jousserau. 'Not? What? Eh?'

Tobias was less afraid of the small artist than

either of Madame or of Isaiah, and infinitely less afraid of him than of the other two in combination. 'It's no affair of yours,' he said sulkily.

'Ah!' returned Jousserau, shaking his lead-pencil at him—'traitor!'

'I won't have it,' said Mr Orme—'I won't put up with it. I am not a traitor. I have done nothing to merit so ignominious an appellation.'

'No?' said Jousserau, in mild inquiry. 'You are nice man. Very. Eh?'

'If,' said Mr Orme, with an air of virtue—'if any confidence had been reposed in me, it would have been a different thing.'—Jousserau responded with a satiric 'Oh!' as if he admitted that this explained everything.—'I had a right,' pursued Mr Orme, 'to expect that confidence would be reposed in me. I have been an inmate of this house for three years, and have always been treated with consideration until now. If the other inmates of the house had seen fit to continue their consideration, they might perhaps have had a right to expect that my conduct should have borne another stamp. As it is, it does not appear to occur to anybody that I am an elderly man, gaining a wretched subsistence by a distasteful occupation, or that the present enterprise lands me, I can assure you, Mr Jousserau, not less than nine-and-eightpence out of pocket.'

A part of Mr Orme's pathos was wasted upon the artist, but he knew enough English to follow the concluding statement. He was so barbarous as to clap his hands at it and to cry out 'Good!' with a look and accent of the liveliest satisfaction.

'Ten bob, less fourpence,' pursued Mr Orme, with a downcast air. 'You can leave the fourpence out of calculation. It isn't worth being considered under the circumstances, and ten bob represents two-and-a-half days' work. I might as well have done two-and-a-half days' work for nothing, and for a man of my years, Mr Jousserau, that is a painful reflection.'

'It is the years that make the difference,' Jousserau answered with a cheerful air. 'I like to think of it. That is, because I am younger.'

In view of this hopeless persiflage, Mr Orme went silent; and the smiling artist continued his sketch at his ease.

Meanwhile, Madame, her husband, and Isaiah were holding counsel together in the kitchen, Madame, by right of sex and volubility, presiding. There was the clearest belief in everybody's mind that Robert Snelling had intended neither more nor less than to make himself master of his ward's belongings. Nobody doubted for a moment that he meant to achieve this purpose by driving John into a condition of idiocy. That had become a creed with Isaiah, who was not without evidence for his belief; and Madame and Monsieur had long since grown to share his convictions fully. The elders had championed the boys, and if for no other reason than that, would have been strongly attached to them; but there were other and worthier reasons for liking, and the good Madame Vigne in especial was overflowing with affection towards both her charges. The idea of surrendering one of them to so pitiless a master as stood in her own mind for Robert Snelling never for a moment occurred to her, and in the heat

and affection of her partisanship she was ready to go all lengths and run all risks.

'We must remember the law, my dear,' said M. Vigne at the beginning of the conference; but Madame flamed out so at this that he dared to say no more. 'The law!' cried Madame. 'What do I know of the law, here or anywhere? I know what is the law of the heart; I know what is the law of heaven! If I were to go to prison for the rest of my life, I would not resign this poor angel into that monster's hands.'

'Precisely, my cherished, precisely,' M. Vigne responded, and so sank out of the discussion.

'That villain,' said Madame, turning to Isaiah, whom of course she addressed in English, 'must never be allowed to find the boy. My husband talks of the law; but the law shall never make me say a word. The children must be got out of the way—that will be easy enough. They can earn their own living. They have never cost us a penny that their diligence has not repaid. And for the matter of that, we are not so poor that we cannot afford to keep them for a little while if there should be need for that.'

'I've got the sack,' said Isaiah, 'as safe as houses.'

'What sack?' Madame asked, with a bewildered look. 'What houses?'

'It's an English saying, ma'am,' responded Isaiah. 'I mean I've lost my place for certain.'

'Oh, I fear so, for certain,' Madame answered. 'I am very sorry; but I hope it does not matter greatly!'

'The place was well enough,' said Isaiah; 'but it wasn't so good that a man need die before finding a better. I've saved a bit, and I've had a bit willed to me, and altogether I'm pretty well, thank you. If there's anything to pay to keep the lads out of harm's way, I can find my share; and I'd as soon hand John over to the Old Un at once as give him to his uncle's care. There's no turning Bob Snelling; and it's my belief he doesn't know what mercy means. As for the law, the lads ran away from home of their own free-will.'

'Ah!' said Madame, 'but we helped them. I do not know the law in England; but if we were in France I am sure we could be punished.'

'But then you see we ain't in France, ma'am,' Isaiah responded. 'We're in a free country, wheer an Englishman's house is his castle. As I was saying, the boys ran away from home of their own free-will; and they're game to do it again, if we only tell them wheer to run to.—Ain't you, boys?—Now, what do you say, Master William?'

'Oh, I'll go anywhere,' said the bulldog youth. 'I know what'll happen if old Snelling catches Jack. Let him wait till I'm his size, that's all. And old Macfarlane.'

'Whatever is done,' said Madame, 'must be done quickly.—Listen, Mr Vintare. My husband has a fellow-countryman in Oxford. He is of the same trade, and John would be useful to him as he has been here. He has a kindness for me, and will do anything I ask him.' Madame blushed at this, and added laughingly: 'He wanted to marry me once; but that was years ago, and he has married somebody else; but we are very good friends. The boys shall go to him. There are plenty of printing-houses in Oxford, for it is a

place of learning, and William will find something to do there easily. They shall go to-night, and M. Jousserau shall take care of them.'

She translated the scheme for her husband's benefit; and the good easy man consented. There was a mighty bustling to and fro whilst the boys' belongings were packed together, and there was a moving scene when Madame took leave of them. John clung to her almost despairingly, and the kind creature had at length to unwind his embracing arms. She cried plentifully when they were gone, but found a little comfort in upbraiding Mr Orme. That personage felt that he had brought his pigs to a poor market. Spurred by the promise of reward, he had walked until he was chafed and footsore. He knew that he was going to be on short commons for a week or two to come; and being easily susceptible to the opinions of other people, he was oppressed by the belief that he was very worthless and had disgraced himself. It was not a very profound sentiment, but the phantom threat of thirst stood at his elbow, and its presence was enough to lend poignancy to any trouble.

HAY-FEVER.

THE popular term Hay-fever gives but an inadequate idea of a curious complaint, the very existence of which was not fully recognised till the beginning of the present century, when Dr John Bostock published an account of his own symptoms and sufferings. At that time it was dimly regarded as a sort of fanciful hypochondriacal affection, of which those who had little or nothing to do became the subject; but cases have of late years been frequently recorded which prove the disorder to be one of great interest on account of the mystery attaching to its early history, its prevalence in all climates and countries, and the painful pertinacity with which it clings to its victims.

It is called in Germany *Frühsummer Katarrh*, or early-summer catarrh; and among ourselves, Hay-fever or Hay-asthma, since the more usual kind begins and ends with the hay season, varying in the time of year during which it appears according as the hay season is early or late. As long as the grass is in flower, it persists; with that, it ceases. The grasses productive of hay-fever are said to be the sweet-scented vernal grass, the rye-grass, and the *holcus* or honey-grass, common in damp meadows. It is found that the fresh plant is less potent in its effects than the hay made from it; and it was long ago discovered that some grasses owe their perfume to the presence of benzoic acid, which is well known to occasion violent fits of coughing and sneezing.

The complaint is, however, by no means limited to the flowers of the field. The same symptoms may be produced by very different causes: by sunlight, by violent exercise, by the dust of rooms; and so capricious are its ways, that it is sometimes difficult to assign sufficient cause for its appearance.

Rose-fever and rose-catarrh are well known in the United States, where the rose is largely cultivated. Peach-cold is an affection of a similar

nature. In India, the blossom of the mango is said to produce it; and Trousseau affirms that he always had asthma if he remained for a few minutes in a room with a bunch of violets. The neighbourhood of a privet hedge and the pollen of the common daisy are said to have given rise to more inconvenience than even the scent of new-mown hay. We are told of a lady who could never remain in the room with a single stalk of Indian corn without being seized with shortness of breath; and an instance is recorded of a man that he could never pass the shop of a certain ropemaker in his native town without suffering from asthmatic symptoms, presumably owing to the dust from the flax.

Cullen speaks of the case of a man who was seized with fits of sneezing whenever rice was thrashed in the neighbourhood of his house; and the effect of ipecacuanha dust is well known to hospital servants. Medical students have declared that they are attacked with shortness of breath if a bottle of ipecacuanha powder is merely opened in the room where they are, and that in none of them does asthma occur under any other circumstances: no other irritant will produce it. It is related that the wife of an apothecary was seized with asthma whenever ipecacuanha root was powdered in the surgery, even if she happened to be in another part of the house at the time. People insensible to ipecacuanha will experience the same sensations from linseed, mustard, or scammony; and an epidemic of sneezing was traced to the use of bitter apple which had been powdered over a variety of articles as a preventive of moth. Scents of all kinds may induce asthmatic attacks, and thundery weather provokes them.

An American writer has remarked that the complaint is patrician, occurring mainly amongst those in high rank and social position, or who are eminent for mental and literary attainments. Divines, poets, medical men, and ladies of fashion, are included in the list of examples. It is certainly a corroborating fact that farmers and field-labourers, who are of necessity exposed to the influence of pollen, rarely suffer from it, owing, it is contended, to absence of predisposition, which mental culture induces; whilst it is more simply explained that they are rendered insusceptible to the action of grasses by constant exposure to their influence.

Similar sufferings to those produced by vegetable effluvia occur from contact with many animals. Dr Hyde Salter, in his valuable work on Asthma, relates that he has met with many cases in which the effluvium from horses, wild beasts, guinea-pigs, cattle, dogs, rabbits, and hares would immediately give rise to a paroxysm. One of his patients always had a fit of asthma brought on by the presence of horses. He was the proprietor of an equestrian establishment, and was therefore always asthmatic; but he had no suspicion of the real cause of his symptoms till he made his fortune and retired from business, when he almost immediately lost them.

Cat-asthma, from nursing a cat or a kitten, closely resembles hay-fever, and the paroxysms are even more violent. The influence seems to be stronger in kittens from two months old and upwards than in full-grown cats; but after the removal of the cause, the symptoms very quickly

subside. Some people are attacked with sneezing in the presence of all animals.

Dr Salter mentions the case of a boy who was never able to keep rabbits in consequence of the effluvium from their hutches always bringing on asthma when he went near them; and another case of a lady who was unable to visit the Zoological Gardens without suffering. A still more curious one is told of a gentleman who was staying at a friend's house in the country when on two occasions he became seized with a fit of asthma, and found in both instances that there were deer feeding at the time immediately under his window. On a third visit, when the deer had been removed to a distance, he was quite free from any asthmatic symptoms.

A case of sneezing produced by contact with a caterpillar is probably unique. A gentleman who had suffered severely from acute pleurisy, the result of exposure to wet and cold while out shooting, became subject on his recovery to what he called 'hairy caterpillary asthma.' If by any chance he touched a caterpillar, especially a very hairy one, he was immediately seized with an attack of shortness of breath, often lasting an hour or more. He was not in the slightest degree affected by pollen. One of his daughters was a cat-asthmatic, attacks of sneezing being always induced by contact with cats, or even by the presence of one in a room. She was not subject to hay-asthma, and was rather inclined to laugh at her father's objection to caterpillars.

Dr William Murrell, of the Westminster Hospital, in a recent article on 'Paroxysmal Sneezing' in the *British Medical Journal*, gives the story of a country clergyman who was always rendered asthmatic by the neighbourhood of a hare or a rabbit, so that if by any chance he met with a man who had been poaching, he at once detected him.

There is no invention or imagination or exaggeration in these things, and what may be an irritant to one class of asthmatics may not be in the least so to another. One person is obliged to expatriate himself in the hay season; another cannot endure the scent of flowers; another cannot sleep on a down pillow, or use mustard in any shape, or pass a poulterer's shop. Even the sunlight is terrible to some inveterate sneezers.

A sudden fright may induce a fit of asthma, or, on the contrary, may cure it; indeed, a cure by violent emotion is more sudden and complete than by any other remedy. A confirmed asthmatic states that once when he was suffering from an unusually severe attack, so bad that he had been unable to speak or move all day, he was suddenly alarmed by the illness of a relative. He ran down two flights of stairs and up again, administered the restoratives he had procured, and then observed, to his astonishment, that his asthma was gone! Another sufferer relates that he was in bed breathing with the greatest difficulty, and unable to move, when a fire broke out opposite his house. When the excitement was over, he found that he had been standing with others looking out of the window, and that he had forgotten all about his asthma.

Of more usual and perhaps more certain remedies there are no end. Dr Murrell has found cocaine useful, and has been able to give relief

with it to many victims of this troublesome complaint. A cigar smoked the last time before going to bed has often ensured a good night's rest. A very slight thing just at starting will determine the advance or the retreat of an attack, for the longer it is allowed to go on, the more uncontrollable it becomes. But a hay-asthmatic is warned never to smoke tobacco but for his malady. Smoking should never be to him a habit or a meal, for it then ceases to be a medicine. Indeed, to him it should be a deadly drug, for it is by poisoning that it cures.

AN ALTERED PURPOSE.

IN FOUR CHAPTERS.—CHAP. II.

It seems taken for granted that, according to the best authorities, and the highest, or at least the most prevalent fashions of taste, nothing need be said of the hopes, the fears, the trials, successes, and disappointments of any heroes and heroines who may get married. Those who have been fortunate enough to taste the wedded bliss of real life, know how far this is a sensible rule, and how far justified by the absence of all exciting episodes afterwards. However, we shall begin by adhering to this rule pretty closely, only indicating the course of Rodbury's life for a few years after his marriage; and it is but fair to his wife to start with the declaration that he was more happy with her than he had expected to be. The love was wholly on the girl's side. Rodbury had not for a long time the least idea of the love which glowed, and flamed too, in her heart. But he saw it at last, and, as a man would see, not as a woman, came gradually and logically to know and understand, that so long as he kept her love, and she knew or thought she had his, no pain, no sacrifice would be too great for her to suffer or make in his behalf. After realising this, he seemed to know, even better than before, that she had never had his love. Her earnestness and intensity almost frightened him; and often, when he was away from her, he would picture her conduct in certain contingencies or trying positions, and the result of these reflections was rarely increased cheerfulness on his part.

Two children were born to them, a girl and a boy. The girl was named Rose. Her mother had asked Rodbury if he would not like to have a second name, after *his* mother; but he said: 'No. My mother's name was not so pretty as your own; so let it be Rose only.'

With the boy it was different. Mrs Rodbury wished his name to be 'Francis John,' after her husband, her brother, and, as it appeared, her father; but here Rodbury was unexpectedly firm. He was very grave for a while, more silent and thoughtful, indeed, than Rose had ever known him for so long a time, and he would sit and watch the sleeping child by the hour together, when this spell was upon him. One day—he was to start on their country round upon the next one—he came in and said he had registered the boy, and his name was Cyrus. It had struck him as being a very pretty name, and he had

been reminded of it by a tale he had recently read.

Rose was quite mortified at this, and shed a few tears of vexation at the idea of her beautiful boy being called by such an outlandish name. Whoever had heard of Cyrus? Such an ugly, foreign-sounding name! Thus spake Rose; but the mischief was done. There was no doubt of that, for Sparle, whose chief failing was not that of placing implicit confidence in any one, went round to the registrar, with whom he had some acquaintance, and satisfied himself that Rodbury's statement was a true one, so far as it went. Sparle qualified it thus in his own mind, but said nothing openly: 'He must have had some reason for calling the boy Cyrus Launceston, and for holding his tongue about the second name.' Thus reflected Sparle. 'Well, I can hold my tongue as quiet as he can hold his, for a bit, anyhow. There is a place called Launceston somewhere; I am sure I have heard the name; perhaps he has something to do with that place. Anyhow, I shall be likelier to find out if he does not know exactly what I suspect; so we shall see.'

This little vexation was soon got over; and Rodbury and his wife parted good friends, when the former went off for his country round. Business was brisk upon this excursion, and there was increased geniality between the partners. A constant source of conversation was little Cyrus, of whom Sparle was quite as ready to talk as was the father, and this was not feigned on 'Uncle John's' part, as he was really fond of both the children. If he had any other motive in so often turning the conversation to this topic, he always managed to conceal it under the interest he assuredly did take in the young ones.

The tour was concluded, and so successfully, that some plans for dividing the round and working it more completely were discussed as the pair returned to London in the best of tempers with each other. They parted at their usual rendezvous, the stable and warehouse, and, as was natural, Rodbury went straight home, or nearly so.

During the time he had been with Sparle, he had called, on returning to and ere leaving London, at a certain restaurant—a 'coffee-shop' it was called in its neighbourhood, but modern taste prefers the foreign name—where, as he had arranged with his friend Mr Ashwell, such letters of importance as it might for any reason be desirable to screen from too general a gaze were to be sent.

Hitherto, these calls had been fruitless; but on this night the landlord said: 'Yes, Mr Rodbury, there is a letter for you at last; and any one would have thought you knew it was coming, for it has not been here an hour.'

Rodbury smiled at this, uttered some little jest in reply, then carelessly thrusting the unopened letter into his pocket, walked away with anything but the air of a man who was expecting important news. This indifference only lasted until he was fairly out of sight of the shop; he then tore open and eagerly read the note. It was brief, and emphatic: 'DEAR RODBURY—Come to me at once; I have news of importance for you—news which changes everything. Do not delay.—H. A.'

This was all ; but there was quite enough in these few words to disturb the reader palpably. With knitted thoughtful brow, he went on until he was within a quarter of a mile of his own home, then, just as he reached the corner of a large street from which his smaller thoroughfare branched, he paused, looked hesitatingly down it for a few seconds, then, as though he had suddenly come to some decision, turned abruptly round and at once struck off in another direction.

As will be imagined, his way led him to his friend Ashwell's, and on inquiry he found that gentleman was within.

'And never more glad to see any one in my life!' exclaimed Ashwell, after a few words of explanation ; 'although I little expected so prompt an answer to my letter. You must have received it, friend Launceston'—

An exclamation and a warning shake of the head interrupted him here.

'Yes, I said Launceston, and I meant it,' continued Ashwell. 'I directed the note to Mr Rodbury, and repeated the name inside, according to our agreement, but for the last time, I hope. Henceforth, you are again to be Cyrus Launceston to me and to the whole world.'

'Why, what—what has happened?' said Rodbury ; and his face paled, then flushed, while his voice faltered as he spoke.

'Your grandfather is dead. I was sent for by his special request, when it was plain that his hours were numbered,' replied Ashwell. 'He is gone ; so you have no cause to fear ; and, moreover, he had completely forgiven you, as I can amply prove.'

'But even if he had—which I could hardly believe if any one else had told me,' said his friend—'even if he had done so, there are others still more dangerous who know—who had proofs that'—

'Not a bit of it, my dear fellow,' interposed Ashwell, as the other faltered. 'But I had better tell you all about it ; so, sit down there—take one of these cigars—and listen.'

Mr Ashwell then entered on a summary of what had transpired of such importance to his friend ; a pretty lengthy summary too, requiring the best part of an hour in its telling ; but a brief outline of his narrative will serve our purpose.

Herbert Ashwell and Cyrus Launceston had been playfellows, schoolfellows, and friends ; while the latter, having once saved Ashwell's life at the imminent risk of his own, had earned the never-failing gratitude of his chum, although he made light of the service himself. He was wont to say, with a little spice of truth, that as it was the only good deed he had ever done, it shone out more vividly with him than it would have done with any one else.

Both Launceston's parents died when he was young, leaving him to the care of his grandfather, a wealthy and in the main a kindly man, but crotchety, hasty of temper, and tyrannical ; not at all a model custodian for a youth, and such a youth. What judicious treatment and care might have done for Cyrus, it is impossible to say ; he had enough, as he owned, of the family gifts to need a great deal of both these essentials, and he got nothing of them.

First, he quarrelled with the old man, violently,

too, as such a pair would be likely to quarrel ; then, as nothing was gained and much lost by this, the young fellow took to craft, and tried to hoodwink his harsh old relation. Unluckily, he got hold of a very bad set ; such a young man as himself was sure to get hold of a bad set ; on which the need for cunning and craft increased rapidly. In plain English, Cyrus was a sad young fellow, selfish in the extreme, dissipated—of course hypocritical—and was sowing worse grain all round than even the traditional wild-oats.

Much detail of his behaviour is not required here ; but it turned out that his grandfather, who was fully fourscore years of age, had held him more closely under watch than the young man dreamt of, so knew of nearly all he would have concealed, among other things of his having given post-obits, bills payable at his grandfather's death, and discounted at a ruinous rate upon the chance of his being made heir to the old man's property. At last there came an explosion, premature on each side, it would seem, for Cyrus could not afford at this crisis to quarrel with the old man, who on his part, had he but waited for a day or two, would have heard of something well calculated to cause a breach between them, had all else been satisfactory.

As it was, they parted after a stormy interview, in which, it was reported, the elder struck his grandson across the face with his cane so as to draw blood. On the next day his bankers advised him that he had slightly overdrawn his account. They had paid his cheque for a thousand pounds, but only out of courtesy to an old customer. This cheque was a forgery, and Cyrus Launceston the forger.

The old man was furious. He paid the cheque, and so obtained possession of it ; but then he gave information to the police, and actually offered a reward for the culprit's apprehension. This was so trivial in amount, however, as to savour more of an insult than a stimulus. It was supposed that Cyrus would endeavour to make his escape to America ; and as he was not stopped at the ports, it was supposed also that he had succeeded.

Ashwell kept upon friendly terms with the old man, and by his counsel and by his unflinching advocacy of Cyrus, who, he always contended, had never had a chance to do well, had gradually soothed the grandfather, who, with advancing years and declining health, became gentler in his memories of the boy, as he termed him, and a severer critic of himself. He thought that Cyrus must be dead ; but Ashwell invariably asserted his conviction that he was not ; he had stronger grounds for this conviction than he chose to confide to the old man ; but the latter was very shrewd, and may have divined that Herbert knew more than he told.

Be that as it may, when the old gentleman died, it was found that the bulk of his property was left to his grandson, if claimed by him within seven years. The forged cheque had been destroyed in Ashwell's presence ; while the old man had written to the police, and had advised the bank, that on reflection he saw it was probable that his grandson considered he had authority to sign in his name ; and so there was no criminality in the act for which he had fled.

'So, everything is plain sailing for you' concluded Ashwell, whose narrative, as may be supposed, did not include all the points herein detailed. 'You are worth a hundred thousand pounds as you stand there, besides the house and grounds. All is clear now. You can go and take possession fearlessly. You will look out for a handsome wife, and settle down among the best of them. And then, you know, bygones will be bygones.'

'And is such a marriage to be the natural result of my change of fortune?' said Rodbury, or Launceston. 'Is it in such a position I am to find my happiness?' He spoke with apparent difficulty, and ended with a short laugh, so harsh and strange, that Ashwell looked curiously at him for an instant ere he spoke.

'You are a queer fellow, Cyrus,' he said; 'but that you always were. Why do you pitch upon one harmless jest—if you like to consider it so—to the exclusion of everything else? When you come into your money, which practically you may do to-morrow, you will naturally think of settling, and then'—

'No! I shall not!' abruptly interrupted his friend. 'I am married.'

'Married!' The surprise had evidently rendered Ashwell incapable of saying more for the moment; but recovering himself, he continued: 'You are married, and have kept it from me? This was not friendly or wise, Cyrus. I should have been glad to know your wife; I might have done more for you, and her'—

'And the children,' again abruptly interrupted Rodbury, as we shall continue to call him. 'Yes, you may stare; but it is true. I have been married long enough to have two children; and my wife belongs to the tribe of hawkers and cheap jacks—or her friends do.'

'By Jove!' muttered Ashwell.

The quick ears of his visitor caught the exclamation, subdued though it was. 'I tell you, Herbert,' he went on, 'that notwithstanding this, she is good enough for me, and is a true and devoted wife, according to her light. I looked upon myself as no better than a fugitive convict, so what did it matter how I flung myself away? But even that last sentiment is all humbug. I repeat that she was quite good enough for me. To keep up my character, I suppose, and to ensure my marriage being in keeping with the rest of my honourable life, I married her under a false name. To her I am Frank Rodbury, and she is Mrs Rodbury.—You might have expected this from me—might you not?'

'Sit down again,' returned Ashwell; 'talk calmly, and reasonably if you can, and tell me all about this strange business.'

His friend complied; and his narrative evidently had the greatest interest for Ashwell. Now, the latter was an honourable man, a generous and devoted friend, as he had shown often enough. But he was, and always had been, under a sort of glamour or charm as regarded Cyrus, whom he rated far too highly, and for whom he always made excuses. He believed in him, as calculated to make a figure in the world if he could only get the chance; and this admiration, this belief, rendered him an unsafe adviser when his friend's interests were concerned; •perverting his own honour and truth-

fulness into something wearing a very different aspect.

On the few occasions when, of late years, he had seen and conversed with Ashwell, Rodbury always left him the better for the interview; but he did not do so on this night. If the counsel Ashwell had given, or rather the hinted suggestions he had made, for the time had hardly come for direct counsel on the subject, were such as would prompt an ungenerous line of conduct on Rodbury's part, fate played strangely and unexpectedly into his hands.

Rodbury walked thoughtfully homewards; it will be admitted that he had some food for thought; and his reverie was so absorbing that it was more by habit than observation that he reached his house, but there he was suddenly aroused.

He dwelt in a small back street, lined with six-roomed houses, decent and quiet enough places, and his, like most of the others, held more than one family. He and Rose held four rooms, a man and his wife rented the other two, and all had hitherto gone on smoothly between them. The man was an omnibus conductor—it must be seen that the social change likely to arise from Rodbury's succession to wealth was great and tempting—so was from home a great deal, and on this particular day, chance, or fate, brought about a quarrel between the two wives, on some mean and paltry question of washing or drying clothes, as far as could be made out. In his then mood, a quarrel on such a basis was infinitely more galling and painful to Rodbury than any outbreak arising from more important matters.

'Why, Rose!' he exclaimed, as he threw open the gate of his little garden and saw his wife standing in the passage leading from the street door, which was wide open, her face flushed scarlet, while she was exchanging an 'angry parole' with some shrill feminine voice in the upper part of the house. 'Be calm, Rose!' he continued. 'Do not excite yourself. If Mrs Kilby has offended you, she shall leave.'

'Leave! Leave!' screamed his wife; her tone was pitched for the benefit of her unseen adversary. 'I should think she should leave! She shall go before dinner-time to-morrow, and I will turn her out myself, if no one else will do it.'

'You! you!—such a thing as you!' retorted the voice. 'It is more than you dare do. I can show my receipts for rent; and you lay a finger on me, or touch anything of mine, and I will have you before the magistrate—a thing I desay you are used to, madam.'

'Come in, Rose! Do you hear? Come in, I say!' cried Rodbury, seizing his wife's wrist. 'You must not go on like this.'

But if he had not known it before, he was to learn now of how little avail are reasonings and commands with an infuriated woman. It was many minutes ere he could part the disputants, whose language grew hotter, as the 'hits' on either side told; and when at last he got his wife into her own rooms, she was seized, as a matter of course, with a desperate fit of crying hysterics.

It was specially unfortunate that such a display should have occurred on this night. Rodbury

had never before seen his wife at her worst; he always knew she was capable of violent passion, but she had not shown it so openly. Twenty-four hours earlier he would have been offended, angry, no doubt, but he would not have been so utterly disgusted and shocked as now.

Rose was penitent on coming to herself, and begged her husband's pardon for the outbreak. He had not shown many lofty characteristics since his marriage, it is true; but for all that, the girl was fully aware that he had been, once in a very different sphere, and was not likely to tolerate such a display. She was very fond of him too; and this fact shone strongly through her penitence, her tears, and her promises of reformation.

In some strange manner, all this, even her affection, contributed to heighten the loathing with which Rodbury already regarded his home; but as he was a man to whom deceit always came easily, he assumed a forgiving mood much earlier, as his wife naively owned, than she had expected; and she thought him the kindest and best-tempered man in the world. The lodger was forgiven also; Rodbury, actually uttered some jests about the skirmish, and so all was harmony in the household once more.

This was of course gratifying, and his excellent temper, after so irritating an incident, was, or ought to have been, gratifying also; but if Rose had some of the failings of a woman, she had a woman's instinctive quickness and penetration as well, and a vague alarm took possession of her. She knew not what she dreaded; but she felt almost frightened when in her husband's presence, and although she had really been a good wife, had never been so docile and watchful to anticipate his wishes as now.

The time had almost come round for the firm—Sparle and Rodbury—to make another start, and the latter grew gentler and fonder of his children's company than was his wont. He had not been a very attentive father, and even in this change there was the vague something which was now ever present to Rose. She tried to laugh it off, and spoke to her brother about it; but the experiment did more harm than good, for she found that a kindred feeling was in the man's mind.

'There's a change come over him that I can't make out,' was his summing-up; 'he keeps his affairs more to himself than he has any need to do; but he has got something on his mind, I am sure.'

The very next day after this consultation took place, Rodbury announced with some abruptness that he should not be able to commence the journey with Sparle, whom he would join about a week later. To the strong remonstrances of his partner, he only replied that he had some important business to look after, and that if any loss ensued, he, Rodbury, was willing to bear the whole of it.

So perforce the matter was settled, Sparle mentioning in confidence to his sister that 'if this was going to be the game, I shall not stand much of it; not but that I shall be glad to be away from him for a day or two.' If Rodbury had not married his sister, it is probable that Sparle would have preferred a dissolution of partnership, as he had never heartily liked the man.

This course was, however, out of the question, and so Mr Sparle started on his round alone; feeling that there was something in the air which boded no increase of comfort to the circle.

THE POST-OFFICE ON WHEELS.

To the vast majority of people the Travelling Post-office is a mysterious institution, very few having any idea of its working or of the mode in which it is conducted. Perhaps this article will have the effect of dispelling much of the mystery by which it is surrounded, so far as the general public are concerned.

It cannot be said that the Travelling Post-office of this country has in any sense had a languishing career; on the contrary, its history marks a continual growth of extension and expansion, so that now its ramifications stretch into the remotest corners of the kingdom. Changes in its constitution there have been, it is true; but in every case the object in view has been increased efficiency. As the railways have been augmented, so has the Travelling Post-office in an even greater ratio grown in extent and importance, till at the present time there is hardly a line of railway within the confines of the British Islands on which letter-sorting in a properly constructed carriage is not performed. The great acceleration which has taken place in the transmission of letters has been mainly achieved by the Travelling Post-office, and this acceleration has stimulated the trade and commerce of the country.

The particular portion of the 'Post-office on Wheels' which I purpose describing is the Special Mail which leaves London from Euston Station daily at 8.30 p.m. I have selected this mail not only because all the duties appertaining to the Travelling Post-office are performed therein, but also because it is the most important mail in the United Kingdom, probably in the whole world. In the Special Mail there are five post-office vehicles, each forty-two feet in length, and one of thirty-two feet—making a total length of carriage-space for postal purposes alone of two hundred and forty-two feet. There is a gangway communication between all the carriages, so that the officers on duty can pass from one to another throughout the entire length without going outside. All the carriages are lighted with gas.

The time is 8.15 p.m. The pair-horse vans which convey the London bags for provincial towns come dashing into the station in rapid succession, and as there are only fifteen minutes before the train starts, no time is to be lost. The bags are quickly removed from the vans, the name of each being called out in the process, thus enabling an officer who stands near to tick them off on a printed list with which he is provided. They are then stowed away in the respective carriages in appointed places. The hands of the clock now point to half-past eight; everything is on board, and the signal being given to start. The distance from London to Aberdeen is five hundred and forty miles, and this distance is covered in thirteen hours and twenty minutes, showing an average speed of a little over forty miles an hour, including stoppages. This does not appear to be a very high rate of speed for a mail-train of this character; but when it is borne in mind that the train

must stop at the large junctions for the purpose of exchanging the mails, and that these junctions are thirteen in number, it will be seen that the actual running-time is but a little short of eleven hours, so that the average speed whilst the train is in motion is close upon fifty miles an hour.

Having proceeded to the principal sorting carriage, we see that there are some thousands of the letters which have come from the London offices still to be disposed of. They lie on the desks in large bundles; but every minute there is a perceptible diminution of their numbers by means of the vigorous attacks of the men engaged. From end to end of one side of the carriage—that farthest from the platform—rows of sorting-boxes, or, as some people prefer to call them, 'pigeon-holes,' are fixed nearly up to the roof, starting from the sorting-table, which is about three feet from the floor. The boxes into which the ordinary letters are sorted are divided into sets, numbered consecutively from 1 to 43, and one sorter works at each set. The numbers on the boxes are in accordance with a prescribed plan, each number representing the names of certain towns, and into such boxes the letters for those towns are sorted. The plan mentioned is carried out as follows: Suppose we say that No. 10 represents Rugby, of course when the mail-bag for that town is despatched the box is empty. It is then used, say, for Crewe, and when the bag for that place is gone the box again becomes empty. It is then used for some other town farther down the line, and so on to the end of the journey. The set of boxes nearest the fore-end of the carriage is used by the officer who deals with the registered letters. This set can be closed by means of a revolving shutter, which is fitted with a lock and key; so that, should the registered-letter officer have to quit his post for any purpose, he can secure the contents of his boxes, and so feel satisfied that they are in a safe place. This officer also disposes of all the letter-bills on which the addresses of the registered letters are advised.

The set of boxes into which the newspapers and book packets are sorted is about twice the size of an ordinary letter set, and occupies the centre part of the whole box arrangement. This space is assigned to the newspaper boxes for two reasons: the set is exactly opposite the doorway through which the bags are taken in at the stopping station, so that they lie on the floor behind the sorter who opens them; he has therefore simply to turn round and pick them up one by one as he requires them, thereby saving both time and labour. Again, as the bags are opened, the bundles of letters which are labelled No. 1 and No. 2 respectively, in accordance with the list supplied to postmasters for their guidance, have to be distributed to the letter-sorters—No. 1 bundles to the left, No. 2 to the right, and this distribution could not be so conveniently performed were the newspaper or bag-opening table placed in a different position. Most of the newspaper boxes are about twice the size of a letter box; some, however, such as those used for large towns like Liverpool, Manchester, Birmingham, &c., are four times the size; and the necessity for this can be readily understood.

We will now look at the other side of the carriage—or that nearest the platform. Along the whole length of that side, strong iron pegs are fixed about an inch apart, and on these pegs the bags to be made up and despatched on the way are hung. Most of the bags used in the Travelling Post-office are of one size—three feet six inches long, and two feet four inches wide; but for the large towns, bags of greater dimensions are required. Each bag is distinctly marked on both sides with the name of the town to which it is to be forwarded, the letters forming the name being an inch and a quarter in length. The name is also stencilled inside the mouth of the bag, so that the sorter has it immediately before his eyes when putting the letters, &c., away. On reaching its destination the bag is emptied of its contents, is turned inside out, and then the name of the Travelling Post-office from which it was received appears in view. The bag is then folded up and kept ready for the return despatch on the following night. In this way it passes and repasses until it is worn out, when it is withdrawn, and a new one takes its place.

We will now assume the train is fairly on its way, and that we are approaching Harrow, the first station at which the mail-bags are received by means of the apparatus. As the machinery constituting the apparatus is of great importance in the system of working, I will here endeavour to describe it.

I may say that the apparatus in the Special Mail is worked in a separate carriage which runs immediately behind the one to which I have referred in the preceding details. A large and very strong net is firmly fixed on the side of the carriage on the near end, and the woodwork being cut away, an aperture is formed through which the pouches containing the bags are taken into the carriage. The net is raised or lowered by pressing down a lever very similar in structure and appearance to the levers which are seen in a signal-man's cabin. When the net is lowered, a strong rope is seen to stretch across from the fore-part, and this rope, being held in position by a chain attached to the back-part of the net, forms what is called a detaching line in the shape of the letter V placed thus, ∇ ; and as the carriage travels along, the rope at the point forming the angle strikes the suspended pouch, and detaches it from the standard, when it falls into the net, and is removed by the officer attending to the apparatus. The machinery is also arranged so that a bag can be despatched as well as received. A man doing this work should possess keen eyes, steady nerves, and a full average amount of strength. On a dark or foggy night it is difficult to see the objects which serve as guides to the whereabouts of the train, and which are technically known in the office as 'marks.'

The net is now lowered for the receipt at Harrow. In a second or two, a tremendous thud is heard, and a large pouch comes crashing into the carriage through the aperture, the men meanwhile keeping a respectful distance. I should perhaps explain that in the Special Mail a new form of net of recent introduction is used. The bottom of it is flush with the carriage floor, and as the lower portion is constructed with an angle of about forty-five degrees, the pouches roll into the carriage by their own weight. In the old

form of net the bottom is level, and as it is about three feet above the floor, the pouches have to be lifted into the carriage by the apparatus-officer. It is always advisable, whenever practicable, to fix the apparatus so that it should be worked after passing through a station, as the station forms the best 'mark' that the men can possibly have for their guidance.

We will now see what the pouch from Harrow contains. It is quickly unstrapped; the bags are taken out; and it is then laid aside, to be used for despatch at a subsequent station. There are three bags for the Travelling Post-office received in this pouch—two containing correspondence for England and Scotland, and one for Ireland. The bags are immediately opened by the proper officers. The first duty is to find the letter-bill; and if there are any registered letters, to compare them with the entries on the bill, when, if correct, the bill is signed and passed over, together with the registered letters, to the officer who disposes of that class of correspondence, and by whom an acknowledgment of the receipt of the letters is at once given to the bag-opener. It is in this way that a hand-to-hand check is established which ensures the practical safety of such letters.

The bag-opener then proceeds to pick out from amongst the mass of correspondence the bundles of ordinary letters, and to pass them to the right or left according as they are labelled No. 1 or No. 2. These bundles are cut open by the respective sorters who work at the several sets of boxes, the letters being laid in a row on the desk, and the men then proceed to sort them in accordance with the addresses they bear. As the boxes (each of which will hold about one hundred and fifty) become full, the letters are tied up securely in bundles, and the sorters, turning round, drop them into the bags which hang along the other side of the carriage. And so the work goes on in the same way throughout the entire journey.

I will now endeavour to show to how great an extent the Travelling Post-office has contributed to the acceleration of correspondence from place to place. On an examination of the letters received from Harrow, it is found that there are three for Aberdeen; and a similar number for that city will be received from the several towns between London and Rugby, and so on. Of course, the number of letters mentioned would not be sufficient for a direct bag between each of these places and Aberdeen; but the small numbers referred to being brought together in the Travelling Post-office, it is found that when the train arrives at Carlisle a sufficient amount of correspondence for the northern city has been received to fill a large bag. This bag is therefore closed at that point, and a fresh one hung up, to contain the correspondence for that city received northwards of Carlisle. The same may be said of the other large towns in Scotland. Now, if there were no Travelling Post-office, how would the few letters for Aberdeen (I merely mention the case of Aberdeen as being a typical one) emanating from the various towns in England be dealt with? In the first place, they would have to be picked up by a stopping train, and even if this train ran direct to Aberdeen, there would be a difference in the time of arrival of at least eight hours. But the letters could not go direct in such a case, as that would mean the making-up of separate bags at

each place; and I have already shown that the letters are too few in number to justify such an arrangement. They would have to be collected at some central office, say at Birmingham, where they would of necessity be detained some time; so that altogether it is probable they would not arrive at their destination early enough to be delivered on the day following that of posting. What, however, is the case now? Thanks to the Travelling Post-office with its mail-bag apparatus, the letters are whirled along at close upon fifty miles an hour without intermission, thus admitting of the delivery of letters from London at so remote a place as Aberdeen long before noon on the following day.

We will now assume that the train has arrived at Rugby, the distance—eighty-four miles—having been run in one hour and forty-six minutes. At this station, mails for Coventry, Birmingham, &c., are left to be forwarded by a branch train. After a stop of four minutes, the train again speeds on its way, the next stopping-place being Tamworth. Here a large number of mail-bags are despatched, including those for the Midland Travelling Post-office, going north to Newcastle-on-Tyne, which serves Derbyshire, Yorkshire, and the whole country-side bordering on the north-east coast; for the Shrewsbury mail-train, which serves the whole of Mid-Wales; and for the Lincoln mail-train, which serves Nottinghamshire and Lincolnshire.

The next halt is at Crewe, Stafford, where formerly a large exchange of bags took place, having been passed without stopping. Crewe is, for Travelling Post-office purposes, by far the most important junction in the kingdom; indeed, I may venture to say there is nothing like it in this respect in the whole world. Within three hours—that is, between half-past eleven at night and half-past two in the morning—not fewer than fourteen mail-trains, each with sorting-carriages attached, arrive and depart from this station; whilst the weight of mails exchanged here within the time specified is not less than twenty tons. A great amount of labour is involved in receiving and delivering such an immense weight of bags, the work being all done by hand, and the mail-porters have to exercise great care in keeping them in proper course for the respective trains. Nevertheless, these responsible duties are remarkably well performed, mistakes very rarely occurring.

I may here say that the Irish mail which runs from London to Holyhead, and in which correspondence for Ireland is almost exclusively dealt with, branches off at this station, the remainder of the journey being run by way of Chester and North Wales. This mail leaves Euston at 8.20 p.m., and the interval of ten minutes is maintained between it and the special mail down to Crewe, the two trains running on the same line of rails to that point.

The mails for Manchester and the numerous towns round about it are left at Crewe, as are those for the Potteries and for the whole of North Wales. A separate mail, called the Bangor and Crewe Travelling Post-office, runs through the latter district, the sorting duties in which are performed in the same way as in the Special Mail, the names of the towns served from it only being different.

Leaving Warrington, the next stoppage is at Wigan. Here the mails for Liverpool are despatched, and the receipt includes bags which have been brought through a long line of country, stretching from Newcastle-on-Tyne through York, Normanton, and Stalybridge, and thence to Wigan. The mails for Preston and East Lancashire are left at Preston, and running through Lancaster, Carnforth is soon reached. At this station the mails for North-west Lancashire and West Cumberland are despatched, and this is the last stopping-place before arriving at Carlisle, which is the terminal point of the North-western Railway.

I must, however, mention the noteworthy despatch of mails by apparatus at Oxenholme, the junction for Kendal, Windermere, and the Lake District. It is the largest despatch by that method in the kingdom, as many as nine pouches being delivered into two nets. Each pouch at this station weighs on an average fifty pounds, so that altogether four hundred and fifty pounds of mail-matter is despatched at this one station—no inconsiderable feat.

At Carlisle the mails for the Waverley country and for the whole of the south-west of Scotland, including Ayrshire, are left. Resuming the journey over the Caledonian Railway, there is another long run—about seventy-eight miles—without a stop, the apparatus being worked seven times in that distance until Carstairs is reached. Here, one of the sorting-carriages is detached, and proceeds to Edinburgh; and a few miles farther on three more are detached, and proceed to Glasgow from Holytown Junction. From that point, therefore, only two sorting-carriages remain in the train, and these go on to Aberdeen.

The next stop is at Stirling, where the bags for the Western Highlands are left; and we then run on to Perth, where the time of arrival is 7.30—just eleven hours after leaving London.

At Perth, the mails for Dundee and the northern Highlands are despatched, the latter being forwarded by a mail-train which runs on the Highland Railway via Inverness. Again the Special Mail starts on its way, there being only one stop—at Forfar—before arriving at Aberdeen, where the journey ends. Here the last bags are despatched. The carriage is clear. The sorting-boxes are carefully searched, to see that no letters have been left in them; and the carriage is then taken charge of by the railway officials, to be thoroughly cleansed and made ready for the return journey on the following day. The duties on the way to London are performed in a precisely similar manner to those on the journey northwards.

UNINTENTIONAL RUDENESS.

NOVEL-READERS, and readers of reviews of novels who hear a good deal said nowadays of the power shown by the modern American fiction-writers in what is known as analysis of character, cannot avoid having seen it remarked that in this respect English romancers and English people alike are to a great extent deficient. Perhaps it is fortunate that this should be the case, as no one with the smallest approach to the power which it is stated is so peculiar to our American cousins,

can fail to have felt that it is essentially a trait of the average English character to be enviably indifferent in its every-day dealings to the more sensitive feelings of its neighbours. Perhaps in no respect is this trait more clearly shown than in the vast amount of unintentional rudeness which is shown by otherwise very excellent people in the course of general conversation with friends and relatives. That there is a distinct element of satisfaction in the delivery of an intentionally rude remark, seems universally admitted. It has doubtless been long meditated, and there is a feeling of positive relief when the duty is despatched. The objectionable person has been duly notified of your sentiments in respect to his conduct, and you have come off possibly triumphant, the feeling of victory only checked by the hope that you have not gone too far; this sentiment, however, being entirely regulated by the importance of the person to whom we have given what in common parlance is known as 'a piece of one's mind.'

In all this, it is easy to see a large element of that irrepresible human nature which plays so important a part in the dictation of our daily actions. But what satisfaction can be obtained by those persons who constantly offend by chance, ill-considered remarks, ruffling all the finer feelings of those with whom they are conversing, it is difficult to understand. The very unconsciousness with which they act in this respect is only the more irritating; such persons, when accused of their thoughtlessness, will invariably be found to defend their conduct by the time-worn truism, that offence should not be taken where offence is not meant. It is perhaps to the universal acceptance among ordinary people of this argument that can be traced the very failing under discussion—the constant recurrence of remarks which, in nowise intended to be rude, as successfully ruffle the feelings of any person of sensitive organisation as the most studied insult. To choose among a legion of cases: a friend has asked your advice, say, in the matter of a list of a few novels to take to the country; one has replied to this flattering evidence of confidence by supplying a catalogue of the merits of which you feel certain even Sir John Lubbock would not criticise, and you are flatly told, perhaps apropos of nothing, on the return home of your friend: 'I don't think much of the choice of books you recommended.' The remark is a simple one, and delivered, doubtless, with a smile and with no intention of being rude; but it requires a heavy draft on one's store of good-breeding to reply in that tone of politeness which society exacts. Now, could not the same canons by which that necessity is dictated have suggested to one's friend that there might be half-a-dozen other less offensive modes of expressing one's opinions, or at least of palliating the ruffling reflection on your incompetence in matters literary.

And so the catalogue might be continued. One's errors are flaunted openly in one's face. 'I don't think much of your diplomacy,' will be the remark with which a failure in the conduct of some unimportant transaction will be greeted by a grinning relative. 'You put your foot in it there!' will say another; while who can calculate the accumulated stores of irritation caused by those thoughtless persons who seem

never to remember, even after years of acquaintance, one's many little prejudices with regard to eating, drinking, sleeping, cats, dogs, burning-hot fires, open windows, draughts, babies, political opinions, and a hundred other things?

It is doubtless because it is a little troublesome to word a phrase differently from the form in which it crudely presents itself to the mind, that so many persons acquire the unfortunate habit of unintentionally offending their friends. 'Evil is wrought,' as Hood puts it, 'by want of thought, as well as want of heart.' It is not exactly want of heart which is the cause of the many thoughtless remarks that are so wounding, because these flippant rudenesses are often addressed to those who are dearly loved; but it would seem as if those who speak of their affection were not fully aware of the exactions entailed by its expression; the due consideration which such a feeling involves for the sensitiveness of others. A little careful study of the mode in which a disagreeable remark can be made positively palatable will be found to be a most useful accomplishment. Such a study, so far from checking, as might be supposed, that spontaneous expression of feeling which some value so highly, will be found, on the contrary, after a little, to have increased the tone and suppleness of those who practise the art, and to have become as facile a habit as the expression of the more outspoken unvarnished truth. It is the wit and polish of the man or woman of the world which enables so many malicious little remarks to be uttered in a tone of such exquisite breeding as to render it impossible for offence to be taken. In this quality our French neighbours are acknowledged peculiarly to excel, not through any natural ability, be it remembered—for the ill-bred French *bourgeois* could with difficulty be matched for the savage rudeness of his average remarks, opinions, and prejudices—but through careful study, in great part through the schooling of those social influences the standards of which are so much more rigorously laid down and carried out by our continental neighbours than is the case with us.

To those familiar with America and American society—that is, in its more refined strata—it will occur that it is perhaps the fact of the large share of these social influences brought to bear on the rising generation that may in a measure account for the superior sensitiveness of the refined American character as depicted in certain of the transatlantic novelists. It is evident that it is not a little the more homely and purely domestic nature of Anglo-Saxon life that accounts—strange as it may seem to say—for the far too natural tone which exists in the every-day conversation of English people. We are prone to pride ourselves on this downright British quality of genuineness, as it is regarded; but there are two sides to the question. Of course, if by long habit we have grown so callous and unsensitive as to find that the unintentionally rude remarks of our friends and acquaintances—*Punch's* long list of 'things one ought not to have said'—pass over us without ruffling our inner nature, perhaps that is all which is required; but to those unfortunate enough not

to have acquired the enviable indifference of their less sensitive neighbours, association with their more thick-skinned acquaintances is somewhat apt to prove trying.

WATER-MARKS ON PAPER.

AMONGST the curiosities connected with the manufacture of paper none are more interesting than the water-marks on paper. From an early period in the history of the manufacture these marks have been used. It is in 1330 we first find a manufacturer's symbol; it is a ram's face, and this figure seems to suggest that wool might be one of the fibres used in the preparation of the paper. Holland gives evidence of the use of water-marks rather earlier than this—1301: among the memorials preserved at the Hague there is an account-book, the paper of which has a water-mark of a circle or globe surmounted by a cross; while on some paper of a little later date appears a rude representation of a jug or pot. The globe and jug are consequently the most ancient marks as yet discovered. The next specimen is from the paper on which is written the account of one of our own countrymen, Henry Burghersh, Bishop of Lincoln, of the expenses of an embassy in which he was employed in the year 1337. The mark is very like a pear.

By means of these marks we obtain certain fixed points, and they render great assistance in determining the age of manuscripts of great importance. The mark of the manufacturer has often been found of use in the detection of literary forgeries. This most ingenious and admirable invention was introduced into Europe by the Spaniards, but the originators of it are veiled in obscurity. The marks of the fourteenth century were for the most part very rudely executed. The most noteworthy amongst these, besides those already mentioned, were a circle enclosing the letter S lying longitudinally, surmounted by a fleur-de-lis; a circle containing what appears to be the letter h, and a straight line as if suspended by a thread; 'a can and reaping-hook,' which appears on a letter dated 1353, written by Edward van Gelre to the Zutphen magistrates; the 'Two Cans,' 1384; the 'Human Head,' 1386; and the 'Half-lily,' 1390. At the commencement of the sixteenth century the marks begin to present a symmetrical and artistic appearance.

The oldest document or paper as yet discovered with a mark is the account-book of 1301, supposed to be manufactured out of linen rags by the Holbein family at Ravensburg. Except this particular specimen, all paper manufactured by the Holbeins bears the 'Bull's Head,' doubtless taken from the coat-of-arms of that family, whereas, as we have already stated, this account-book is marked with the 'Globe and Cross.' The Globe and Jug are the most ancient marks as yet discovered; and these, together with the Post-horn, which appeared about 1376, became by the end of the fourteenth century the principal marks on paper manufactured in the Low Countries, whence they spread during the ensuing hundred years to Gouda and Delft.

Paper, as a rule, without any characteristic sign is the oldest; since the water-mark signifies a certain progress in the art of paper-

making. Other noteworthy marks are: a sp. g with leaves and a fruit or flower; a drawn bow with an arrow; a perpendicular line with stars at each extremity between two circles; the letter R ensigned by a cross; two crescents through which a perpendicular line passes, terminating at each end; a cross, a bull's face, a demi-griffin, a pair of balances, the unicorn, an anchor, and 'P' and 'Y,' the initials being those of Philip of Burgundy and his wife Isabella, whose name at the time would be usually spelled with a Y. The Duke married Isabella in 1430, and before that date P only is found; after that date, P and Y. Caxton seems to have used paper chiefly obtained from the Low Countries, and in addition to the 'Bull's Head' and the 'P' and 'Y' there will also be found the 'Open Hand' worked on the paper on which the *Golden Legend* was printed in 1483, and also the 'Unicorn.' Other paper employed by this famous printer came from Germany, since in his *Recueil of the Histories of Troy* (1468) there appears the 'Bunch of Grapes,' which was a German mark. In the *Game of Chess* the paper bears evidence of Italian origin, as there is the mark of an 'Anchor enclosed by a Circle.' The 'Dolphin and Anchor' was a very famous mark, and after the 'Bull's Head,' perhaps the best known, the reason for this being because the device was extensively used by Aldo Manuzio, who has thus perpetuated to our day the ancient symbol of the city of Venice.

Many of these water-marks have determined the names of the different-sized papers. For instance, the post-horn was the mark of a paper now called Post paper, the texture and size of which have been little altered. Then there is the *fleur-de-lis* of the Demy, which also retains its primitive device and nearly its proportions. There is little doubt that the Fool's Cap gave name to the paper now distinguished by that singular epithet, although it has resigned its mark and adopted various others, such as Britannia, and the Cap of Liberty on a pole. Many of the water-marks for a considerable period have been emblematic, so to speak, of the subject-matter of the book. One of the early Strasburg Bibles, although it contains the common 'Bull's Head,' yet adopts a 'regal crown' on those pages which were devoted to the printing of the two Books of Kings. In the *Berlingheri Geographia*, the pages will when held to the light be found to be embellished with ships, ladders, arrows, and other figures symbolical of discovery and speed. At the present time, nearly every manufacturer has his own special device, so that any attempt to form a collection would be a task of immense labour. 'Paper-mark' is the more correct term to be used in speaking of these marks, since they are merely ornamental figures in wire or thin brass sewn upon the wires of the mould, and like those wires, they leave an impression, by rendering the paper where it lies on them thinner and more translucent. The manufacture of paper intended to be distinguished by a mark requires three contrivances—the sieve, cross-wires, and the mark or mould; to the second of which are to be ascribed the upright or transverse lines; and to the latter the particular figure or ornament of which it is the counterpart. These contrivances have in recent years been improved upon, so that shaded water-marks of the most artistic forms can now be produced.

As in the human countenance, while a general conformity of design exists, there is nevertheless sufficient distinctness to mark the identity of the individual; so among paper-marks, the various species or families, as they may be termed, while consisting of the same general figure or design, present a variety of minor characteristics by which they may be particularised. We have alluded to the names given to denote various kinds of papers, which are curious and in many instances absurd terms. In ancient times, when comparatively few people could read, pictures of every kind were much in use where writing would now be employed. Every shop, for instance, had its sign as well as every public-house; and those signs were not then, as they are now, only painted upon a board, but were invariably actual models of the thing which the sign expressed. For the same reason, printers employed some device, which they put upon the title-pages and at the end of their books; and paper-makers also introduced marks by way of distinguishing the paper of their manufacture from that of others, which marks becoming common, naturally gave their names to different sorts of paper. And since names often remain long after the origin of them is forgotten and circumstances are changed, it is not surprising to find the old names still in use, though in some cases they are not applied to the same things which they originally denoted. The same change which has so much diminished the number of painted signs in the streets of our towns and cities, has nearly made paper-marks a matter of antiquarian curiosity, the maker's name being now generally used, and the mark, in the few instances where it still remains, serving the purpose of mere ornament rather than that of distinction.

AN AMERICAN INDIAN POTLATCH.

THE word 'Potlatch' is one which to many of our readers may be unknown. We will give an explanation. It is a word in use by the American Indians of the North-west Territory, and means 'to make a present.' The ceremony which goes by this name is the following. When an Indian has accumulated wealth—usually in the form of horses, blankets, and weapons, and wishes to become a great chief—he sends out invitations to the chief men of the surrounding tribes and reservations asking them to come to a certain place at a given date. When the guests arrive, the early part of each day is taken up by the presentation of gifts by the inviter, and speeches and songs on the part of the receivers. The reader must not imagine that the gifts are absolute, as in reality they are merely temporary, and have to be returned with interest whenever the recipient in his turn gives a Potlatch. The Indian nature does not permit of anything being done without a clear prospect of making by the transaction in the long-run. The afternoon of each day is spent in horse-racing and betting, for greater gamblers than Indians it would be hard to find.

More than a year ago, the writer and a friend had the good fortune to find themselves at a rancher's house in the wilds of British Columbia

at the time when a very large Potlatch was going on in the neighbourhood; so, in company of the worthy rancher and one or two cowboys, early one forenoon we mounted our half-broken horses and began to make our way towards the Indian camp, which lay about four miles off in the same valley. All were in good spirits, and the day as fine as could be desired. The trail led us over stony bluffs, with here and there a fine smooth stretch of sage-brush and bunch-grass. On these the speed of our horses was tested as we raced along.

Soon we reached the last bluff, and there below us lay the camp. All around wandered the horses and mules, and here and there one saw an Indian boy, lasso in hand, on a barebacked horse, driving in some straggler. The scene was very picturesque: the flat bottom covered with fine grass; along the banks of the creek the fringe of cotton-wood and sumach trees with their bright yellow and crimson foliage; on either side the steep mountain-slope, covered with giant pines, with here and there a rocky crag standing out bare and hard, lay before us. These, combined with the animated scene and the gay dress of the Indians, formed a picture never to be forgotten.

After a moment's pause to take in the view, we made our way to the camp, where we dismounted, leaving our horses standing with the bridles hanging loose, which secures a native horse from straying. The number of Indians present was very large—some hundreds of men, with their wives or *klutshmen* and *puposes*. The men mostly wore a blanket as their main covering, and the brightest and gaudiest colours were evidently the most popular. A small proportion had their faces painted with red and white; but this custom seems to be dying out under the influence of rapidly advancing civilisation.

When we arrived, the giving of presents was in full swing. Under a large booth made of pine branches sat the giver of the Potlatch, surrounded by his squaws. When one of the young *stowashes* or 'braves' lifted up a present, the giver stood up and in a loud voice addressed the man for whom the gift was destined. This speech we were informed by our guide was a short history of the feats and exploits of the recipient. Whenever this was ended, all the *klutshmen* joined in a chorus, singing the praises of the great chief. Then the gift was carefully examined, and replies and thanks were given. In the short time we watched the proceedings, a large variety of goods, consisting chiefly of blankets, horses, and flour, changed hands.

In the other parts of the camp gambling with cards was almost universal, and the large sums of money staked were not at all in keeping with European ideas of Indian poverty.

Among other objects of interest was the native way of breaking a wild horse. Not far from where we had left our horses stood a small pine-tree, fastened to which by a lasso was a young horse. The lasso was tied round the animal's neck, and sufficient length of rope given, so that the horse when lying down had his head kept off the ground. In this way the animal was left. After standing quietly for a few minutes, the struggle was begun. Finding himself restrained by the rope, the colt tried by every means in his power to break the band, striking with his forefeet and throwing him-

self down, squealing and screaming in perfect fury. Hour after hour came and went, and at length the spirit was so far broken as to allow a man to approach without a renewal of the struggle. The hind-legs were then lassoed, and the head-rope loosened, a saddle slipped on, and before long an Indian was firmly seated, and the horse's first experience of the supremacy of man begun.

The afternoon of the day we spent watching and taking part with the Indians in horse-racing. The course was short, about six hundred yards; but the pace was good, and the riding of the Indians even better—far too good for fourteen stone of European flesh to have a chance against. The riders used no saddles, having merely a girth passed over the knees and drawn tight, as a support. The sole object of these races is betting, as no prizes are given.

As evening came on we turned our horses homewards, and soon reached the ranche, where a pleasant evening was spent. It does not often chance that a traveller happens to strike one of these gatherings, but should any of our readers have such luck, let him take the advice of one who has been present, and turn aside and visit what ere long will be a thing of the past.

A SUMMER MEMORY.

THE leaves that danced in the summer glory,
In crisp brown clusters around us lie;
No more they whisper the sweet old story,
That thrilled our hearts in the days gone by.
I was a king when we stood together
Beneath their shadow of tender green;
My sceptre, dear, was a sprig of heather,
The hills my kingdom, and you my queen!

You softly laughed on your throne of daisies;
Young Love kept watch through the rosy hours;
The fragrant wind seemed to sing your praises
Amid your vassals, the blushing flowers.
The sunlight flashed on the earth's green flooring;
The fairy clouds seemed to smile above;
And, ah! the lark o'er the cornfield soaring,
Your dear name trilled in his strain of love.

The dawn of love in your fond eyes shining,
One wild red rose in your bosom fair,
You shyly blushed while you watched me twining
A floral crown for your nut-brown hair.
My love, you were but a village maiden,
Your only dowry your rustic grace,
Your simple heart with truth's treasures laden,
Your winning smile, and your modest face.

Where first we plighted our vows, we linger;
But love lies bleeding, and hope is dead;
The ring of another gleams on your finger:
Your pallid cheek and your drooping head
Alone betrayeth the tearless sorrow,
That well accords with the autumn's gloom;
And we must mourn on the cheerless morrow
The Love that laughed 'mid the summer's bloom.
FANNY FORRESTER.

A FEW WORDS ON DRY-FLY FISHING.

DRY-FLY fishing is a branch of the angler's art which has been developed only within the last few years. Neither Izaak Walton nor Cotton, as far as we know, ever dreamt of such a thing in their philosophy. Indeed, it is only on the chalk streams of Hampshire, Berkshire, and a few other of the home counties that the dry and floating fly is used to any extent. On these rivers, however, it is now acknowledged to be the most killing method of catching big trout in the day-time and in clear slow-flowing water. Sometimes, perhaps, with a stiff breeze blowing on the stream, the ordinary way may be adopted—namely, fishing with several flies on the line, which are cast down stream and allowed to sink. But when an angler has once taken to the more scientific method of using the single dry-fly, he will probably scorn to go back to his former tactics.

The best trouting in Great Britain is to be obtained within an hour or two's railway journey of the metropolis. The Test, Itchen, Kennet, and portions of the Lea all produce trout of great weight and beauty. The Kennet fish are remarkable for their brilliant colour when first caught, and for their beauty of form. We have seen a big Lea trout, five pounds in weight, 'cut' like a salmon. Nor are fish of this size by any means rare on some of the preserved portions of the river. But there are numbers of other less known streams with their tributaries which produce fine trout—amongst them the Colne, the Ver, and the beautiful Pang.

It seems to be an acknowledged fact amongst anglers that there is no sensation so pleasurable, no excitement so intense, as that imparted to the fisherman by the first wild rush of a big salmon: the hissing or screeching of the winch as the line flies off is no less melodious to his ear than the baying of the foxhound to that of the huntsman. And yet, as a sustained and never-lessening pleasure, it is hard to beat fishing with the dry-fly over a big rising trout. He has to be warily stalked; the gut must be like gossamer, and the cast finely

judged and executed; and then, even if the fish rises and is hooked, what a great chance he has of escape by snapping the gut, or by darting into a bunch of weeds and freeing himself from the cruel barb! With such fine tackle there is no certainty of success till the landing-net has actually enclosed his shining sides. Dry-fly fishers as a rule only cast over a rising or feeding trout. The fly after each cast is dried in the air by a backward and forward motion of the rod, and is presented to the fish up stream and floating. The artificial fly corresponds as nearly as possible with the real insect which is on the water and on which the fish are feeding. Pondering over these things, over fishing ways and fishing days, there comes back the memory of a pleasant day spent last spring on a beautiful trout stream within forty miles of town—an unpretentious little brook, and a tributary of Father Thames.

A beautiful May morning, just before the time when the tender verdure of spring is lost in the lavish vegetation, in the unbounded wealth of summer. From the little village inn we crossed the road and passed into some green water-meadows, through which the bright water glides so quietly. Thrushes were singing their loudest, and blackbirds fluted mellow notes from every topmost branch of oak and elm; the nightingale's song rang out clear from copse and hedgerow; butterflies, brimstone and orange tipped, came out in the sunshine, and tortoise-shells after their long winter sleep. All living creatures were full of movement, full of a great joy in the *reveille* of spring. Following the windings of the stream, we came to a little rustic wooden bridge, and leaning over, noted a good trout sucking in some of the 'olive-dun' flies which were sailing downstream. Getting behind the fish and creeping on hands and knees within casting distance, I put a fine imitation of the natural fly over him. He rose instantly, but missed it; and after this nothing would induce him to rise again. A great splashing and shouting close behind us announced the fact that an otter hunt was at hand. All hope of sport on the main stream, where the otter

hounds had been, was dispelled; so we walked up to some little tributaries about a mile's distance. It was an easy jump across the widest of these streams, yet all were well stocked with beautiful fish up to a pound and a half and two pounds in weight. Mid-day still found me with an almost empty creel, for the 'rise' was slight. Espying a farmhouse across the meadows, we went up and begged a glass of milk, as the sun was hot. The farmer's daughter, a rosy-cheeked girl, willingly complied with our request, and showed us into the best parlour.

After quenching our thirst with the delicious milk, we turned towards the stream again. A little rivulet flowed right through the farmyard, forming a pond, which was clear and shallow. Imagine trout-fishing in a farmyard! We took a nice fish here, and several more just beyond the house, where the water was overhung with brambles and rather rapid in parts. The 'rise' of fly was soon over, so we gave up fishing for a while and explored the course of the little brook. It is quite an idyllic trout stream, such as the Laureate describes so exquisitely:

I murmur under moon and stars,
In brambly wildernesses;
I linger by my slinging bars,
I loiter round my cresses.

Even though fish cannot be caught just now while we are waiting for a fresh batch of fly to come on, surely all around there is that which should fill the mind with sweet content. True, it is too early for the June wild-roses, with their white petals, which 'go straight to the heart'; nor is the fragrant meadow-sweet in bloom yet awhile; but cowslips and marsh marigold are gorgeous in the meadows, and the tender wheat never looks more beautiful than in this its young verdure.

In the copse hard by is a dell painted azure with bluebells: wood-anemones are there too, and slender cuckoo-flowers. A kingfisher flashes by in the sunlight, and at our approach a moorhen dives out of sight with a great spluttering. Wag-tails are running about, never very far from the cattle, and the breasts of some of these birds are yellow as the marigold itself. At the thin, feathery edge of the copse, and within a few paces of the water, there is a wild-duck's nest. In some rank herbage overhanging the water a dabchick is sitting on two stained eggs; seeing us, she slipped into the stream; and when we returned, half an hour later, the eggs appeared to have been taken away; but the bird had merely covered them over with a few dead leaves. You have only to sit quite still for a while and the dabchick and wild-duck will both return to their nests. The water-rat fearlessly swims about within a few yards of you, while a rustling in the copse announces the approach of a timorous leveret. As for the sedge-warbler, he will come into the bush under which you are reclining and pour those sweet stolen notes into your very ears. But make the slightest movement and he instantly leaves off singing, the leveret rushes off in wild terror, and the dabchick slips into the water again. As for the fish, a shadow will alarm them; indeed, you must stalk your trout just as you stalk a rabbit feeding in the woodland path or a deer on the hillside. Practice and care alone will tell the angler how near he can approach a fish without

alarming it. And herein, as much as in anything else, lies the difference between a good and bad fly-fisherman: the former creeps patiently towards his fish inch by inch, and often on hands and knees; he takes one or two casts in the air, to judge the distance to a nicety, and keeps the point of his rod well down, to avoid flinging a shadow on the water. The latter strides forward with his rod held straight up, and instantly makes a bungling cast. The trout sees the rod or the angler himself, and is gone like a flash of lightning.

Fly-fishing, then, in our southern counties is somewhat of an art in itself. It takes us through no wild mountainous scenery like that of the North, but through peaceful fields and woodlands, and by clear limpid streams, where there is the fragrance of the flowers, the brimful joy of the summer fields, and the ever murmurous refrain of the brook.

JOHN VALE'S GUARDIAN.

CHAPTER XVII.

THE sun was setting in a great skyey field of ruby and topaz when Robert Snelling, scrupulously attired for out-of-doors, stood at his own gate an hour or so after his interview with Mr Orme. He was not a man who at any time made much outward show of his inward sensations, but just at this moment there was an air of solid purpose about him which might almost have been called portentous. The dark-blue cutaway coat, buttoned tightly over his massive chest, revealed a mere segment of sprigged white waistcoat, not as yet too portly, but giving such promise of girth and weight as a typical British yeoman of Snelling's inches might reasonably desire to show among other signs of comfort and prosperity. His dogged chin settled itself with its own air of bullying resolution in the cleft of a faultlessly starched high collar, over a bird's-eye necktie secured by a small gold pin. As to his nether man, he was equipped in brand-new cords and boots. His hat, a shade broader in the brim and lower in the crown than common, gave a proper finish to his figure. From head to foot he was solid, prosperous John Bull, a thought too pompous and too dictatorial, even in repose, but looking rectitude and competence all over.

He was not thus splendidly bedizened for any common occasion, and the solemn bucolic dandyism of his attire was indeed in itself enough to proclaim to all the thoughtful and experienced of the neighbourhood the intent of the wearer. It was known, and had been known for a month or two past, that Snelling 'hung his hat up'—that is the local phrase—at the abode of Ephraim Shorthouse, whose daughter Cecilia was grown to a marriageable age, and was known to have coming to her, one of these days, a very pretty penny. Not a word had been spoken on either side, but in such a case the most elaborate statement could have made things no clearer than they were. A pretty girl, a handsome jointure, a widower yeoman of middle age turned seriously dressy on a sudden, and riding over with the regularity of Time himself to the house of the lady's father for six months on end as surely as the Saturday night came round—who needed to

ask an explanation of these things? One would as lieve have asked for an explanation of the pretty girl herself as to the change in Robert Snelling's aspect or the purpose of his weekly visit.

He wore no spurs, but he carried in his ungloved right hand a heavy and supple riding-whip with which, now and again, he slapped his trimly booted calf resoundingly.

'D'ye mean to be all night bringing that mare round?' he shouted at length, without turning.

'Coming, gaffer, coming,' a voice responded from the region of the stables; and shortly after, the nondescript groom and man-of-all-work led the mare delicately clicking over the bricked pavement of the yard.

'How comes it you keep me waiting?' this fashion?' Snelling demanded.

'She put her off-hind into the stable bucket, gaffer. That white stocking takes a deal o' polishing to look nice.'

The man stood at the bridle; and Snelling, putting his foot into the stirrup, mounted solidly, and settled into the saddle with an air of being twice as strong and twice as ponderous as he really was.

'Where's Isaiah?' he asked with surly majesty.

'I haven't sin him since this morning, gaffer,' the man replied.

'Tell him,' said Snelling, 'to be indoors when I come back again; I have a word to say to him.'

The fellow touched his forelock, and the master rode away, a personable and commanding figure.

He had been accustomed all his life to set his purposes ahead of him and to go straight towards them, and having once resolved, had very rarely troubled himself to look behind or to examine anew the motives which had started him. But the news of the afternoon had stirred and shaken him more than he cared to confess, and in the very midst of the assurance and resolve which he told himself he felt, there were all sorts of earthquake tremors, and now and then a fear which might have been inspired by conscience. But the one thing which most animated his spirit was a settled glow of wrath against young John. It was no part of Snelling's character to desire to understand his own emotions, and he did not pause for a second to inquire why he was angry with his ward. If he had made such an inquiry, the answer would have been simple and easy to find. Young John stood between him and his desire. He had a right to stand there, and Snelling had no right to the desire, but that made no difference worth speaking of, unless some underlying latent sense of it lent fuel to the flame. What right had the young brute to have a right at all? What right had anything or anybody to stand between that grasping Ego and his wish?

He had kept strict account between the estate and himself of every farthing, partly because of a rooted business instinct, but partly as a guard against a possible accusation. No neighbour should be able to tell him, at such or such an hour you began to think this property your own; and if ever claim or investigation should arise, he was safe and clear. But almost from the moment of John's disappearance the houses and the land and the incomes therefrom had

taken that sort of root in him which a man's own property is apt to take, and by this time it had grown to be a part of him, so that he felt it was no more easily separable than a living member of his body. Of the two, if the choice had been given him, he would rather have sacrificed a limb. It is imaginable that there are many people in the world who would do as much as that to retain their own, or even to become possessed of other people's property; but there was an unusual grip in Snelling's character, and wealth was a passion with him.

And now, on the top of security and ease, this abominable news of John's health and mental prosperity came with a sort of shock which seemed to justify any intensity of hate and anger. To get the boy back into his own hands was the first prime necessity, and beyond that he pretended to see nothing, though in the hidden recesses of his mind he kept one fixed and wicked purpose. He might as well have given it the whole daylight field of fancy to roam about in. If he had acknowledged to himself this villainous offspring of his greed, he might have encountered it less often, and have been less troubled by it; but forcing it to lurk and hide, he had to force himself to keep an eye upon it; and it was the very centre of himself, and occupied him altogether with a torturing insinuation. 'I am here,' said the black phantom—'here, ready and waiting for your bidding, and you know the purpose you mean to put me to.' Not to listen, not to see, not to admit to himself that the thing was there, was a constant grinding preoccupation to him.

The clean-shaven calm face, with its healthy red and white and resolute shallow eyes, told nothing. He rode at serious jog-trot through the scented summer dusk, and presented to all whom he met or overtook the same image of portly rectitude and prosperous honesty. There are many sorts of men who in rural districts would have fallen under suspicion if they had been situated as he was. To be in trust of valuable estates for a boy reputed to be of weakish mind, and to have that boy mysteriously disappear within a few months of his natural protector's death, would have looked too lucky to be natural; but Snelling's probity was beyond doubt or cavil. There is nobody so suspicious as a rustic, nobody so fond of evil surmise and scandal; but his neighbours left him tranquilly alone, and nobody saw so much as a movement of Robert Snelling's little finger in the fortune which had befallen him. Isaiah and his wife, for their own sakes, had kept their own counsel, and nobody else had a gleam of light about the matter.

Snelling had some four miles to ride, and at the end of his journey the cosy lights of curtained windows peered at him through a network of darkened foliage. The click of the mare's shoes had hardly come to a standstill when a door was thrown open, and a fat man appeared in the doorway, standing like a comic silhouette against the glow of the lamplight.

'Who's there?' said a voice.

'It's me, Shorthouse,' Snelling answered.

'I had a notion as it might ha' been.—I'll send somebody round for the hoss in a minute.' With that the fat man disappeared for a moment, and by-and-by his voice was heard uplifted in the

back premises. A farm-servant came shambling out and led the mare towards the stables. The host reappeared in the doorway, and stood there to welcome his visitor.

'You're a bit late to-night, Robert.—Come in.'

'Yes,' said Snelling; 'I'm a bit late. I've been delayed by business.'

'Here, Cecilia!' cried the host; 'come and tek Mr Snelling's hat from him.'

'No, no,' said Snelling, with ponderous politeness; 'I can hang my hat up without a lady's help.'

'You're cleverer than I be, if you can,' returned Shorthouse chuckling. 'In my day, a young fellow had to get the gell to help him.'

Thus, in the fashion of the country, was quite a delicate hint as to the position of affairs; but Snelling kept silence in a stately resentment of it. Cecilia was there already, waiting with outstretched hand. She was standing with her back to the light, and Snelling from his superior height saw her head directly against the lamp, which made a dazzling halo round it, and kindled certain wavy locks into live gold.

'If you will give me your hat, Mr Snelling,'—she said.

'I take it as an honour, Miss Shorthouse, of which I am unworthy.' He surrendered the hat with a rustic bow, and she slid away with it. Snelling stood in the middle of the roomy floor with his feet planted somewhat apart, and his shoulders squared with a sufficient air of self-importance, pulling off his left-hand glove, and bending first one knee and then the other to ease the tight embraces of his riding cords.

'Yes,' said Shorthouse, as if translating the solid swagger of his visitor's demeanour, 'there's no mistake about it, Robert; you're a fine figure of a man—a very fine figure.'

'That's well to know,' returned Snelling stolidly; and placing his gloves and riding-whip upon the table, he drew up a chair and stood with both hands resting upon it until Cecilia returned and took a seat beside her father. Then, with another rustic bow, he sat down.

'Fine ripening weather, Shortus.'

'Pretty middlin',' Shorthouse answered, and pushed a leaden tobacco-box across the table towards him. There was a solemn filling of pipes. The girl handed a lighted spill to each, and then there was a solemn silence. After a lapse of five minutes, the lover renewed his courtship.

'Got the Hilly Piece drained yet, Shortus?'

'Very nigh.'

'Toughish bit o' work it's been, I reckon?'

'Ay!' Shorthouse responded; 'toughish.' Three minutes later he added: 'You may call it toughish, and say none too much about it.'

'Yes,' said the courtier, 'I suppose so.'

After this outburst, the impassioned affair went on as before. The two men smoked as if that were the sole business of their lives, and the girl folded her little muslin apron into aimless plaits. She was a pretty little creature, and looked as if she could have taken part in a livelier entertainment. Once or twice she lifted her eyes to look from her father to the stalwart gentleman who came courting. A momentary gleam of mirth lit her face, but she dropped back instantly to an expression of the demurest primness, and her

fingers went on mechanically with their idle business.

'Just call for supper, Cecilia,' said her father, when the courtship had gone on upon these lines for perhaps an hour.

The girl obeyed; and a substantial joint of cold roast beef was set upon the table, together with a home-made loaf and a great jug of foaming ale. When the meal was over and the table cleared, Cecilia kissed her father, shook hands with Snelling, and retired. Then there was more smoking and another silence, until the courtier dropped one hand heavily on the table and turned towards his companion. 'Shortus,' he said, 'a word with you.'

'At your service, Robert.'

'You've took notice, I daresay, as I've been calling here pretty regular of a Saturday evening for some time past?'

'Why, yes,' said Shorthouse, with the tone and aspect of a man who is not willing to commit himself too far; 'I won't say as I've let that go by altogether onregarded.'

'I've had a purpose in it,' Snelling pursued, 'as you may or may not have lighted upon.'

'Percisely,' said the other. 'I may or I may not have lighted upon it, as you say, Robert.'

'I don't suppose,' said Snelling, 'as you'd have any particular objections to regard me in the light of a son-in-law?'

'No,' answered Shorthouse, with drawling deliberation; 'there's nothing particular agen you, Robert, so far as I know.'

'Very well, then,' said the ardent lover, 'we may look on that as settled; and I'm willin' to talk business whenever you've a mind to.'

'Hold on a bit,' rejoined Shorthouse. 'Fair and softly rides far. As for looking on it as settled, that's more than I can say. There's the little gell to be considered, and it's more her affair than mine.'

'Cecilia,' said Snelling, with more than common solemnity and slowness, 'can hardly have mistook my meaning. A well-conducted young woman would naturally take steps to put a finish to a courtship if it was distasteful to her.'

'There's something in that,' returned the elder. 'Cecilia's a sensible gell. Her knows very well as you haven't come and took your victuals and smoked your pipe every Saturday hevenin' for the last six months for nothin'.'

'Just so,' said Snelling. 'I suppose I may leave the matter i' your hands?'

'Her'll hardly ha' got her frock off yet,' said papa. 'I'll go up and fetch her down.'

'No, no,' responded the lover. 'There's no such hurry as that comes to. You can speak about it i' the morning.'

'Very well, then,' returned the father, who was anxious to show at least as business-like a composure as the other displayed. 'I'll give you a word about it i' the hevenin', if you'll ride over.'

'I'm not quite sure about to-morrow,' answered Snelling; 'I've something in hand as won't bear waiting, and I've got a bit of a journey to take to-morrow.'

'Very well, then,' returned papa; 'make it Monday. I'll have it out with Cecilia in the morning, and you can come for your answer when you please.'

Snelling had not meant to be so precipitate in his declaration ; but he had a reason for accelerating the pace of love's impetuous chariot. If he proposed whilst it was still an understood thing amongst his neighbours that the property he held in trust was virtually his own, he thought that he stood a better chance of acceptance. He was solidly well to do without the farm, the mill, and the malthouse, and was quite conscious that he was no bad match for any girl of his own rank in the whole country-side. But he was persuaded that John Vale's acres would have their due weight in Shorthouse's mind, and in his daughter's also, and the events of the next day or two might seem to take them from him. He had vowed already that nothing should take them finally away, and his whole mind was fiercely dedicated to that vow.

THE COUNTRY OF A THOUSAND LAKES.

FINLAND.

On the eastern shores of the Baltic, the last resting-place left to a race whose original seat was in the Ural Mountains, and who have been pressed back east and west from this centre, live more than two millions of people. Finland—that is, 'Fen Land' (Finnish, *Suomenmaa*, the Swampy Region)—with its deep bays and inlets, its innumerable lakes and islands, its moraines and its roaring cataracts, is a country which undoubtedly has a brighter future. The people, who call themselves *Suomilainen* (Dwellers in the Fens), and who are known to us as Finns, are the most advanced of their whole family, the Magyars being the only other Finnic race that has become civilised, and these the Finns have far outstripped in intellectual capacity.

A moment's glance at the physical aspect of the country will show that after the retreat of the glaciers, the land must have gradually subsided, giving access to the sea, which slowly penetrated eastward and westward, and thus formed the Gulf of Finland. This subsidence was evidently followed by an upheaval, which is still slowly but surely going on, and of which proofs are not wanting both on the coast and in the interior. Nowhere in Europe are erratic blocks more numerous. Stones of all sizes are scattered about or heaped together grotesquely, especially at the outlets of the valleys, and they are yearly stranded in more or less quantity on the islands. There are also very many *harju* or moraines to be found in Finland, and, like those in Sweden, these cross the lakes here and there, looking like broken ramparts of ancestral castles. The high-ways, connected where it is necessary by bridges and ferries, follow throughout their length. The most remarkable of these, and the one most frequently visited by travellers, the Punga-harju, is one hundred feet high, and connects the two sides of one of the northern basins of Lake Saima, south of Nyslott. Its entire length is seven miles, but it is strengthened towards the centre by an island formed of blocks of gneiss. Aided by such natural formations as this, the inhabitants gradually acquire land, which becomes year by year,

owing to the felling of timber and the process of cultivation, more and more fertile.

The Finn has by long experience become proficient in the science of draining swamps and skilfully directing the course of streams, and he is constantly altering the face of the country. Sometimes, however, the engineers are deceived in their calculations when constructing a dike, as in the case of Lake Häytäinen, north of Joensuu, in East Finland. For the purpose of gradually lowering the waters of this basin, the level of which was seventy feet higher than that of the neighbouring Lake Pyhäselkä, a ditch ten feet broad was begun in 1854, and soon changed to a widening stream by the rains and melting snows. But on August 3, 1859, the dikes intended to carry away the overflow suddenly gave way, followed by a rush and roar heard at Joensuu, six miles off. The inundations lasted three days, during which time Lake Saima, which received the overflow, was so agitated that the vessels navigating its waters could scarcely resist the violence of the waves. The mass of solid earth carried down formed a large delta in Lake Pyhäselkä, and greatly reduced its upper area. These inundations are of frequent occurrence, the upper lakes tending constantly to drain into the lower.

Finland, however, of all European countries has least succeeded in getting rid of the surface-waters representing the lacustrine period which followed the glacial epoch. It is completely intersected with lakes, pools, rivers, and swamps, and of its southern portion nearly half the surface is under water. The rocks and boulders are of hard granite, gneiss, and porphyry. Although, owing to the slight elevation of the interior, the falls and rapids are not so numerous, yet in their rugged surroundings and wild leaping waters, they may compare favourably with Scandinavia. The well-known fall of Imatra, which some have even ventured to call the Niagara of Europe, and which no visitor in Finland fails to see, is the most beautiful of these. The river suddenly descends through a rocky gorge, having a fall of seventy feet in a distance of ten hundred and seventy feet ; below this, it again spreads out into a wide still basin. The hotel, which is situated near the Falls, is a favourite resort of both natives and foreigners, and the fishing in the stream and lake is undoubtedly good.

The northern part of Finland lies within the arctic circle, and the climate in these high latitudes is necessarily severe. The long dull night of winter gives way at length to a brief ardent spell of summer, during which the sun never sets, but just drops into the wide waste of waters, and poised there to dye the whole stretch of lake and forest and the midnight sky with its rich passionate floods of colour, rising again to shed its warmth upon the quick-ripening grain and suddenly-maturing summer vegetation. The evening and the morning twilight are, says a popular and well-known Finnish legend, two lovers, betrothed, but parted by the stern decree of darkness. In weariness and waiting, but still with patient endurance, they pass the long nights and weeks and months of winter, and are for a fleeting moment united in the kiss of the midnight sun, soon to be once more parted, and to resume their separate existence. This myth betrays the tendency to poetic

fancy and figure which is such a strong characteristic of the Finn. He believes as no one else does in the power of words, and words in song have with him a magic influence. The belief in magic itself has also always had a strong hold upon him, and still has in the country districts, where incantations and charms are yet practised, in spite of enlightened Christianity and the penalties of the law.

The Finns have an ancient and peculiar mythology, which has no close resemblance to that of any other people, but which has, of course, the same general ideas as run through all mythologies developed from poetical versions of natural phenomena. The popular poetry of this people bears witness to a high intellectual development, and their epic songs, recorded by oral tradition alone, still live among the poorest of the people, and preserve all the features of a perfect metre and a more ancient language. Jumala, the heaven, is the name of the great divinity, the ruler of all things. He rules over the clouds and sends the rain; the winds are his breath, the thunder his voice, the lightning his sword, and the rainbow his bow. His consort is the earth-mother who produces all, and takes all back into her bosom. Their children are Wäinämöinen and Ilmarinen, the heroes. The former is the lord of wisdom, of song, and of music; the latter is king of the winds, of water, of fire, and of the forge. One represents the intellectual, the other the physical powers of man. Tuoni is the god of death, Kauna reigns over the tombs.

Songs telling these stories and of the great deeds of their gods were long known to exist among the Finnish peasants, before any effort had been made to reduce them to writing or to collect them in any systematic manner. In 1822, Dr Zacharius Topelius made a collection of poems, which he published in five parts; and in 1831 a number of young men in the university of Helsingfors formed a Literary Society mainly for the purpose of perpetuating and improving their national literature. Among them was Elias Lönnrot, the son of a peasant, who in the intervals of his labours as a physician had already made some progress towards the desired result by a profound study of the Finnish tongue, Swedish being at that time the language universally spoken. The Society contributed a sum of money to Lönnrot for the prosecution of his labours, and for many years he wandered from hut to hut, along the remote and winding shores of the lonely lakes, and through the forest-crowned heights and rocky valleys, sitting by the fireside of peasants and fishermen, learning from old man and child, gleaned here and there a broken fragment or a connecting link, and at last weaving the whole chain of scattered song and fantastic legend into a grand epic poem, which Professor Max Müller says 'will claim its place as the fifth national epic of the world, side by side with the Ionian songs, with the Mahābhārata, the Shāh Nāmeh, and the Nibelungen.'

The poem was called the *Kalevala*, from Kava, the mighty one, and the importance of it was at once, on its being printed by the Society in 1835, recognised throughout the country. It is written in eight-syllabled trochaic verse, which is the peculiar and characteristic metre of the Finns. Poetry is their natural speech. The mother as she hushes her babe, the old man telling stories to

the child, the children playing around the open door, all insensibly fall into verse. Ordinary speech is occasionally metrical. There is no rhyme in the *Kalevala* except by accident, but much alliteration, and the language is strongly trochaic both in accent and quantity. The metre may be slightly compared to *Iliuwatha*, both in its simple form, and because also of its constantly repeated echo. There is in the *Kalevala* a certain unity of plot, although it is rather a cycle of songs than one poem, and it is evident they are the work of different minds at different ages. It is singular to notice the occasional introduction of Christian ideas, which have no doubt become incorporated with it during the process of being handed down by word of mouth. There appear now and again glimpses of a Trinity, and the poem has almost a Christian ending. The Virgin Maryatta bears a son, whom Wäinämöinen, in consideration of his miraculous birth, orders to be killed without being baptised. But the magic child speaks, and convinces him of error and injustice; whereupon Wäinämöinen grows sad and puzzled. The child, who is none other than the Christ, grows up, and becomes king of Kaléva; then Wäinämöinen, unable to endure the new dispensation, sails away to the west in a wonderful brazen bark, leaving his *kantele* or sacred harp and his songs as a legacy to Finland.

The leading idea throughout the *Kalevala* is the old one of the strife between the powers of darkness and of light, between good and evil. The poem consisted originally of thirty-two runes, which have in the later editions grown to fifty. In these the story is told of Wäinämöinen's birth, offspring as he was of the daughter of the air, the winds, and the waters. Many winters and summers he spends floating on the bosom of the ocean. Wherever he lifts his head, an island is formed; when he stretches out his arm, he creates a promontory. At last the eagle, king of birds, flying westward, and seeking for a place of habitation, beholds the god in mid-ocean. She builds her nest upon the knees of Wäinämöinen, and lays seven eggs; six of these are golden, and the seventh of iron, to which Finnish mythology attaches always a peculiar superstition. From this insecure resting-place the eggs fall and are broken; out of their fragments are formed the earth, the sky, the sun, stars, and clouds. Thus Wäinämöinen, or Ukko (the venerable, the old), is the creator of everything; he brings down to mortals the celestial fire, he invents the *kantele*, and, like Orpheus, he enchains every creature upon earth by his music. All turn to him for succour and help. The sweat that drops from his body is a balm that heals all sicknesses; he is the god of peace, of order, and of harmony.

The language of the Finns is peculiarly adapted to poetic form. The flexibility of its construction, the variety and picturesqueness of its expressions, the abundance and originality of its figures, all tend to make it the fit vehicle of that poetic inspiration which the Finn receives from his environment—the long dark stretches of birch and pine forest, wreathed with garlands and fringes of lichens, which in this northern climate are particularly beautiful, and whose sombre shadows form a telling background for the leaping cascades and waterfalls, clad in their white mantle of foam.

Although there are but nineteen letters in the language, the dictionary published by Lönnrot contains over two hundred thousand words. The constant repetition of the same letter may be seen in the following short extract from the *Kalevala* :

Vaka vanha Väinämöinen :
Sen varsin valheteltki,
Ei sinua silloin nähty,
Kun on merta kynnettiin,
Meren kolkot kuokittiin,
Kala-haavat kaivettiin,
Kuuhutta kulettaissi
Aurinkoa auttettaissa
Otavaa ojennettaissa
Taivoa tähtitettäissä,
Miekkojasi, mieliasi,
Tuuriasi, tumiasi,
Waan kuitenkin, kaikitenki
Lähe en miekan mittelöhön
Sinun kanssasi katala
Kerallasi kehno raukka.

The *Kalevala* has been translated into Swedish, German, Hungarian, and into French prose by M. Léouzon le Duc. A more recent translation into Swedish has been just completed by Mr Karl Collán, librarian of the Public Library of Helsingfors; and the third and fourth runes, with slight portions of the first and second, were translated into English by the late Professor Porter of Yale College, whose knowledge of the people and their language eminently fitted him for the task, which, however, was only undertaken during the last few declining years of his life. It is in the metre of *Hiawatha*, and was published in New York in 1868. A quotation from it, descriptive of the birth of the brief, fruitful summer which near Uleåborg suffices to sow, ripen, and reap wheat within the space of forty-two days, follows :

Rise, O earth ! from out thy slumbers ;
Bid the soil unlock her treasures ;
Bid the blade arise in beauty ;
Bid the stalk grow strong and stately ;
On a thousand stems uplifted,
Let the yellow harvest ripen ;
Let it cover all my cornfields
Hundredfold for seed I planted.
Ukko mighty ! God above us,
Gracious Ukko ! Father in heaven,
Thou who all the sky commandest,
For the fleecy clouds appointing
Every morn their course and pathway,
In thine airy realm consulting,
In thy kingdom taking counsel,
Send us clouds from east and north-east,
From the south and from the sunset ;
Let them scatter drops refreshing ;
Bid them all their sweetness sprinkle,
That the ear may lift its treasure,
And the corn make haste to ripen.

Soon from out the earth and darkness,
Lo ! the tender blade uplifted,
And anon the ears unfolded,
Through the care of Wainamöinen.

A more recent translation of the *Kalevala* is that by Mr J. Martin Crawford (London and New York, 1889).

There are two distinct types of Finns—the Tavastian and the Karelian, each taking its name from the province it inhabits. They are a fine, tall, well-built people, their hair becoming much darker as they grow up, although as children it is almost white, and has given rise to the proverb, 'As fair as a Finn.' In religion they are Lutheran, and their translation of the Bible and Psalter dates

back to soon after the Reformation. The physical aspect of Finland is unfavourable to its ever being largely populated ; and the whole area, which is larger than Great Britain and Ireland, has at present scarcely half the population of London, the proportion being at the rate of about five to the square mile. As in most other countries of Europe, the female sex is largely in excess of the male, and this is accounted for partly by the drinking habits of the men, but chiefly by the risks of the seafaring life, in which so many are engaged ; over five hundred, it is computed, being annually drowned. The tide of emigration sets mainly to Russia and the northern parts of Norway, but a large colony of Finns have long been established at Hancock, in Michigan, where they publish journals in their own language.

The history of Finland is simple. Its union in the thirteenth century with Sweden was productive of lasting benefits ; thence it obtained Christianity, western civilisation, and a constitution of liberal laws, but with this disadvantage, that Swedish became the language of the cultivated classes and of the schools. Finland remained united to Sweden for nearly six hundred years, and was on the whole a faithful ally. It was to the Finnish courage and endurance that Sweden owed many of her brilliant victories under Gustavus Adolphus. But from the time that Peter the Great founded, on territory conquered from Scandinavia, the capital of the present powerful empire of Russia, the acquisition of Finland was only a question of time. Piece after piece was taken ; till, in 1809, Sweden yielded the whole to the Emperor Alexander I., who convoked the States at Borgo, and assured them that he would preserve intact their constitution, their laws, and liberties ; after which they did him homage as the Grand-duchy of Finland.

The old town of Åbo was formerly the seat of the university, which was founded there in 1640, but removed to Helsingfors in 1820. The latter city is also the seat of government, and boasts the most northerly Botanic Garden in the world, it being several degrees nearer the Pole than St Petersburg, Upsala, or Christiania. Helsingfors is also noted as the birthplace of Professor Nordenskiöld, the celebrated Arctic explorer, who was educated and received his degrees from this university, although he afterwards became naturalised as a Swedish subject and took up his abode at Stockholm.

Various lines of railway intersect the southern part of Finland ; but the chief communication is by steamboat, of which, during the summer, there is a frequent service between the towns upon the many lakes. There are no diligences ; but in the country districts, a small two-wheeled conveyance, drawn by native horses of a rather under-sized but remarkably strong and enduring breed, is much used.

The cultivation of the soil forms the occupation of a large portion of the Finlanders, and this industry receives great encouragement from the government, who have established Farming Schools in many centres for the training of women in the theory of agriculture, as also in that practical part of it which they have invariably undertaken. At the same time the government assists small farmers by advancing, under certain conditions, sums of money without interest.

The manufactures of Finland are chiefly woollen, cotton (the town of Hammerfors is called the Manchester of the country), leather, and a curious and elegant kind of pottery. In the country-places, many people are occupied in making articles such as baskets, cradles, pouches, boots and shoes, from birch-rind, which they strip off the trees in large pieces, and then cut and prepare for use, rolling it up in balls.

Within the limits of this paper, we have only been able to touch on a few of the more salient points in the characteristics whether of this unique country or of its inhabitants; and there have been, up to the present time, few accounts of travel in Northern Europe written in the English language which do more than devote a stray chapter or two to Finland. It is probable, however, in these days of universal travel that it will not be long before we become better informed concerning the natural history, geology, constitution, laws, literature, industries, and future possibilities of this Land of Lakes; and until this is accomplished, the inquirer may turn to the admirable works of Retzius, Ignatius, and Buch, from which all statistical information can be obtained; or the charming romances of Topelius, several of which have been translated from the original Swedish.

AN ALTERED PURPOSE.

IN FOUR CHAPTERS.—CHAP. III.

DURING the next few days Rodbury was from home a great deal. To his wife's inquiries he repeated his statement that he had some important affairs to attend to; and in this he was in a sense telling the truth. Among other things he visited a shipping office in the city; he saw his solicitor more than once; he arranged with the executors of his grandfather's will, and he was with his friend Ashwell every day, sometimes, twice in the day.

He was with him one night just before the time he had agreed upon to join Sparle, only one clear day being left.

'You do not look well, Cyrus,' said his friend; 'you are letting these matters excite you to a dangerous extent.'

'Perhaps I am,' returned Rodbury, passing his hand over his brow. He had indeed a fagged, haggard look, which justified his friend's remark. 'It is very well to advise me not to allow these things to worry me; but just consider for a moment what "these things" are. No one but a scoundrel could do them at all. I have had such a hardening career, that I must own I am really surprised at having enough vitality in my conscience to disturb me.'

'I am sorry to hear you speak like this,' replied Ashwell, who was palpably hurt by his friend's words. 'You know you are releasing the girl from a union which will soon be, if it is not already, hateful to her, while to you it must be simply maddening. You provide handsomely—'

'Oh, yes, yes!—that is all right,' interrupted the other; 'and you must not think I intended any reflection upon you—far from it. I know

that your advice has been for what you felt was the best; but then, you see, you have not to carry it out. I shall be out of the way of her ravings and frenzy, I know; but I can picture them, and shall hear them as plainly as though she was by my side. Then the children too—they are helpless innocent things, who have done me no harm.'

'They will certainly not be more helpless by your action,' said Ashwell; 'you provide for their education and their future. Do think, if only for a moment, of what they would grow up to be, with such a mother and such friends! However respectable according to their own standard, to you they would be a constant source of misery and mortification.'

'That is enough, Herbert,' again interrupted the visitor. 'I am going to do it; that is settled. But I am not well to-night; I shiver one moment, and feel all on fire the next. I shall not be better until the next two days are past. Everything is ready, and to-morrow night I start from Euston Square. I will tell you how I have arranged.'

He went on to detail certain plans, connected, as the reader must long since have perceived, with the abandonment of his wife and children. He was going abroad for at least a year, perhaps two years—it might even be for ever; and a solicitor—not the launceston family solicitor, we may be sure—would explain to his wife that the marriage being illegal, she was at liberty to marry again; that Mr Rodbury was gone, never to return, but that she was left independent, as were the children. This handsome mode of dealing with her would effectually allay all anger at the desertion; and long ere Cyrus returned from his tour, her wealth would have gained her an alliance in her own sphere, and all inquiry for him would have ceased.

Of course there were an infinity of details springing out of such a scheme as this; a mean dishonourable scheme, in which, but for the facility with which the best of us find arguments to justify our wrongdoing, it would have been wonderful to see such a man as Ashwell allowing himself to take an active part.

After a long interview, which was far from tending to compose his nerves, Rodbury went home, conscious that he was indeed 'out of sorts,' as he phrased it, and conscious too, once or twice, that he had forgotten where he was, and even where he was going. He rallied from this immediately; but these were ugly symptoms, and each moment he felt that he required a greater effort to throw them off. 'I shall be glad when it is done,' he muttered, as he turned into his own secluded street. 'I shall not, I hope, then feel quite so much of the hangdog and the sneak as I do now. I can hardly bear to see the light in the window where I know Rose is waiting for me, listening for my step; and listening, too, for the slightest noise from the room where the children are sleeping. They have never done me any harm, and poor Rose has striven to the best of her power to make me happy. Egad! I am a model husband and father!'

Then, he started to find himself wandering into a wholly different train of thought, and although his feet had mechanically, as it were, carried him to his own gate, he had for the last minute been

in fancy walking over the well-remembered downs and hollows among which his youth had been passed. 'Another week of this would kill me,' he muttered as he opened the door; 'I almost wish I had not come home.'

As he had divined, Rose was awaiting his return, and had prepared some delicacy—it passed for a delicacy with her friends—for his supper. When she found he would not touch the little repast, and complained of his head, her wifely anxiety took alarm; she noted how flushed and strange he looked, and insisted upon his lying down at once, then busied herself in applying cooling lotion to his brow, and made him a cup of tea, midnight though it was.

She was a good nurse, and a loving tender wife, despite her faults and vulgarities, for which, indeed, she was in nowise responsible. She had been taught no better; and that her character was such as Rodbury well knew it to be, proved the goodness of the heart, which could not be materially affected even by such a training as hers had been.

'If you are not better in the morning, Frank,' she said, as she sat by the head of the bed and looked anxiously into his flushed face, 'we must send for Dr Berge, the first thing.'

'I shall be all right in the morning,' said Rodbury; but his words were hardly distinct; 'only I feel so chilly now.'

She knew he could not be suffering from great cold, yet laid more clothes on him, and then in a few minutes he complained of the heat, and reproached her with smothering him under so many blankets.

All his utterances wandered away into broken incomprehensible speech; and thus it continued all night, Rose never slackening in her attention, or murmuring at the irritable, often unkind remarks he made. It was a long night, yet morning came at last; but no cure on the part of Rose, no change from night to day, could benefit Rodbury, and Dr Berge had to be sent for.

By this time the invalid had ceased to speak, or, at anyrate, to speak distinctly, although he almost constantly uttered unintelligible phrases. His wife asked the doctor if there was any danger of some kind of fever coming on; there had been a deal of it in the neighbourhood, and she had been very frightened on account of the children.

The doctor said she was right. Her husband was down with a fever, but not of the kind which, as he knew, better than most persons, had been so rife in the vicinity. Her husband was suffering from smallpox. So, for the present, Frank Rodbury's scheme ended in the disease which seems to inspire more terror than any other of the malignant scourges which afflict humanity.

The house was speedily cleared of all inmates save the sick man, his devoted wife, and a trained nurse; for the Rodburys were for that neighbourhood wealthy people, and could afford all which might lighten or soothe such an illness. Yet such an illness was never yet passed lightly through, although in the end Rodbury recovered, and was as well as before—he used in after-years to say he was better—and although it happened with him, as it does now and then with such

patients, that he was scarcely marked by the terrible 'pitting' of the disease.

Dr Berge congratulated him, and told him that he owed his escape chiefly to his wife, 'who,' said the portly, genial old doctor, 'is the best nurse I ever saw. Mrs Garminger, whom I recommended, you know, is a first-rate nurse, as professional nurses go; but it is no disrespect to her to say that Mrs Rodbury is worth half-a-dozen of her or any other paid attendant.'

Rodbury agreed in this opinion. He knew, and had marked all through, without prompting, what his wife had done; and now he was out of danger and could think collectedly, he did so think of Rose, and was not satisfied with his solution of the old problem, let him study it as he might.

With regained strength he felt, and despised himself for so feeling, his previous horror of his position; and with the morbid sensitiveness of an invalid noted, even watched for, the faults and shortcomings in the woman who had risked her own life to save his, and whose pale thin features so brightened up when she saw him smile, and who was so happy when he showed symptoms of reviving strength.

He had long since written to Ashwell, at an agreed address, and directed to a feigned name—such an arrangement would be sure to suggest itself to Frank Rodbury. This was, in a sense, to Ashwell's relief, for he fully thought that his friend had gone abroad without seeing him again, or, which was as strange, without taking full possession of his inheritance. He, Rodbury, had said that he would call on his friend as soon as it was safe for him to go out, and consult him as to what should now be done.

Never before had Rodbury known such a conflict on his mind as to what he should do and what he ought to do. What he should and what he ought to do was, it was true, chiefly considered as regarded his own welfare and comfort; but yet some minor amount of thought for others mingled with this and greatly aided to trouble him. All through his life he had been accustomed to consult only the gratification of his own desires, and to act as seemed most agreeable to himself, so that even so much wavering as this was a sign of improvement.

But he was heir to a large fortune; there was a fine home in one of the most beautiful of English counties awaiting him, or scenes of, guile and brilliancy in foreign lands might be his, should he prefer to seek them; and despite his better but feebler self, the loathing of his present home—and horror at the idea of taking from it such a woman as Rose to show as his wife—rolled back upon him like a tide, and he determined to carry out his old resolve.

'It will be better for her as well as myself,' was the ready sophistry which rose in his mind. 'She will be a good deal happier in her own sphere, where she shall never want; and the children—well, she would not like to lose them.' So by the time he was fairly convalescent, his plans were in much the same position as before his illness.

He had been out several times. On the first occasion Rose went with him for a ride. This was in a carriage hired from the nearest livery-stable. They traversed the West End of

London—Hyde Park, Buckingham Palace, Regent Street, Oxford Street, and the like being included in the tour—thus affording a treat of the highest kind to Rose, who, although a Londoner born and bred, had not seen this fashionable, this aristocratic, this fairyland district in short, half-a-dozen times in her life.

She was delighted with the excursion, and so pleased to know that her husband was able to be out again and could sit by her side, looking as handsome as ever—his beauty must be taken, on Rose's estimate—that her poor eyes, weakened, it might be, by the fatigues of nursing, or perhaps by some hidden cause, filled ever and anon with tears. Yet she would not go for a second drive, and was indeed more languid and weak than even her recent fatigues would account for, or than suited her brisk, energetic temperament.

Rodbury saw this, but decided it would pass off; women were always nervous, or defiant, or excited. These, or one of these, accounted for all her symptoms to one so easily disposed to be satisfied.

Again the eve of his intended departure arrived; again he had an interview with Ashwell, when he boastfully contrasted his renovated health with the wretched state in which he was when he paid his previous farewell visit, as it was intended to be. Ashwell was less enthusiastic; he had been touched by what he heard of Rose's conduct, and had once or twice ventured upon a suggestion, or an approach to one, by which he hinted at Rodbury's taking his wife abroad with him, where nobody would know her, or be likely to find fault with her; but this was not well received, and so was not pressed.

Going home from this final interview—home for the last time! after that night he would be free from all these sordid surroundings—he was startled by coming suddenly upon Mr Sparle, his partner, who was sauntering slowly up and down a neighbouring street, and evidently waiting for him. He was dressed respectably after his fashion; but this was a fashion which almost proclaimed his trade, and he was smoking a short clay pipe.

'I thought you were a hundred miles off, Jack,' said Rodbury, overcoming a strong impulse to shudder in disgust; 'I did not dream of seeing you here.'

'No, I daresay you did not,' replied Sparle; 'but somehow, I did not feel easy about Rose, and—and there were two or three other things weighing a good deal on my mind, so I have run up, you see.—No; I am not going in yet, nor you neither,' he continued, as Rodbury was about to turn into the street in which he lived; 'I want a little talk first.'

'Talk away then!' exclaimed his companion, assuming a lightness and indifference he was really far from feeling.

'I came up to see how Rose was getting on,' resumed Sparle. 'I was up two or three times while you were ill, as I suppose you know. But I heard from a party who lived about here some things I didn't like; and, in fact, he says he believes you are going to make a bolt of it.'

This speech was enough to stagger most men. To find his secret intention so accurately divined, and by a stranger of whose very existence he had been ignorant! It required his utmost nerve to repeat his careless laugh, and to inquire: 'What

next? Am I going to take the stock with me, or do I mean to make you a present of it?'

'I had thought of that,' said Sparle, after a pause; 'and I am glad to hear you speak so easy about it. We have never been exactly chums, you know; but I did not believe you were the man for such conduct. But here is another point: why don't you come out candid and say who you are, and what your friends are? You never told us why you named your boy Cyrus; you never even told us what his right name was. I found out, however, that he was registered Launceston as well'—

'You did, did you?' interrupted Rodbury.

'Yes, I tell you straight I did,' returned his companion; 'and more than that, I found there was a place of that name down below Plymouth; and I sent a man as had been in the police, all the way down there to inquire after any Cyruses and Rodburys what he might find. It cost me ten pounds, if it cost me a penny, and all to no good.'

'That was a pity indeed,' said Rodbury, as the speaker paused. He was far quicker than Sparle, and had run swiftly over the probable consequences of this activity on the part of his brother-in-law.

'Now, don't sneer at a fellow's anxiety,' resumed Sparle. 'I have no relations in the world but my sisters, and I would do anything for them; yes, and for your two children, Frank. You may not think it, but I am very fond of them as well, and I want them as well as Rose to be put straight, especially now.'

For a little while Rodbury said nothing; his companion had unconsciously supplied him with additional reasons for carrying out his plans without delay. Sparle's quest had luckily failed, in one instance; but some unfortunate accident might betray him—Rodbury. The knowledge of his son's second name, given when he never dreamt of the inheritance which had since become his, and the bestowal of which he now bitterly regretted, showed how dangerous such inquiries might become.

'Well, we will go in now,' he began at last, 'if you have quite finished all you have to say.'

'All right; I understand you,' retorted Sparle. 'I have pretty nigh finished, so we will go in. You have not been home all day, I believe?'

'No, I have not. You are correct in that belief, as in so many other things,' replied Rodbury. 'Have you anything to say about that?'

'Well,' Sparle began slowly, after a brief pause, 'not a great deal, only you heard me say "especially now," when I wanted things put straight, did you not?'

'I did; and wondered why it was "especially now," as you seem to have been meddling in my affairs for a good while past,' was the gracious answer of Rodbury.

'What I meant was just this,' continued the other: 'you have not been home since breakfast, so do not know everything. If I was anxious about Rose before, I am more anxious now, for while you were out, she got worse. I went for Dr Berge, and he says she is very ill. In fact, Frank Rodbury, your wife is took with the worst kind of smallpox, and I don't think even you will sneer at that.'

'Rose attacked by smallpox!' echoed Rodbury,

who was almost stunned for the moment at hearing this, while a host of images instantly flashed through his mind.

'Yes, sir,' replied Sparle gravely; 'your wife is took with the smallpox, and Dr Berge says it will go hard with her.'

MILITARY GYMNASIUM SCHOOLS.

GYMNASIUMS, as an item of military education, are of comparatively recent introduction into the British service. Only about a quarter of a century has elapsed since the establishment of the parent schools at Aldershot and one or two of the lesser standing camps in the south of England; and even now, though to be found in the more important stations, the gymnasium has not yet become a universal institution in connection with military centres. As applied to the training of soldiers in modern times, gymnastics were first introduced in the Prussian army about 1806, at a period when the famous teacher, Guts Muths, had made such exercises exceedingly popular among the young men of the civil population. In the course of time the Prussian troops displayed obvious signs of the advantages of this species of training; and in 1844, Louis-Philippe established a similar but considerably extended and improved course of instruction in the French army. Subsequently, gymnasia were introduced into almost all European armies, though, as already hinted, our own military authorities were somewhat tardy in taking steps for their adoption.

The buildings constructed as gymnastic schools for our soldiers are very similar in plan. The walls are lofty, and the roofs high-pitched, chiefly to offer facilities for what may be termed aerial exercises, which will be noticed a little farther on. Most of the older schools are wholly built of wood, and at a distance present very much the appearance of Aldershot huts of exaggerated dimensions. The newer buildings, again, have walls of stone or brick, and are altogether of a more substantial nature than their precursors.

As the outward aspect of the gymnasia usually shows little variety, so the internal fittings are in most cases very much alike. There is invariably a small office for the superintendent, who is a non-commissioned officer in possession of a certificate as a thoroughly qualified instructor, which qualification he has obtained at Aldershot, the headquarters of this department of army education. The superintendent or sergeant-major has assistants, varying in number according to the attendance at the school. They are ordinary soldiers who have displayed proficiency as gymnasts, and have gained certificates of a less ambitious sort than that of the sergeant-major, who is practically in supreme command of the school. An officer, however, who is also certificated, occasionally looks in to see that everything is in 'good order' and the work being carried on according to regulation. The officer sometimes essays to instruct in person, and he is not unfre-

quently found competent to do so in a masterly manner, having himself had to pass through an exhaustive course in order to obtain his certificate.

The office, above referred to, of the superintendent contains among other things a weighing-machine; for every man, on beginning a course of instruction, is weighed, or, in technical phrase, 'weighed-on.' Likewise, on the conclusion of his curriculum he is 'weighed-off.' He is also measured so as to ascertain the dimensions of his chest, arm, and forearm; and when 'weighed-off,' is expected to show, not so much an increase of weight as an improved muscular development of the parts alluded to. These particulars are carefully entered in a book, which receives the sedulous attention of the sergeant-major, and is kept with the neatness and accuracy of a ledger. This book, then, and the weighing-machine and measuring tape, are the most noteworthy objects in the office.

On entering the gymnasium itself, one observes at a glance that it is furnished with an ample supply of the paraphernalia necessary for its function. A pole, technically known as the 'mast,' reaches from the middle of the floor to the highest central portion of the roof. Around this at a little interval are suspended ropes for climbing. These are what are called 'slack' ropes—that is, they are not attached to the floor, but swing freely from the ceiling, to which they are securely fastened. Along one side of the building are pegs, on which are placed the belts and shoes used by the men when at gymnastic drill. There are also 'horses' for vaulting, parallel bars, horizontal bars, 'back'-boards, and a variety of other appliances, including a large assortment of dumb-bells and bar-bells, single-sticks, foils, and 'dummy' rifles with bayonets.

Courses of army gymnastic instruction are of two kinds. The first is the recruit's course; the other the course for the 'trained soldier.' The recruit's course is of longer duration than that of the trained soldier by some weeks; and may be stated to continue for one hour daily for a period of sixteen weeks. It is on the whole the more arduous of the two courses, partly, no doubt, in consequence of the comparative awkwardness of the men, and also in some degree owing to the more rigid attention bestowed upon it by the instructors—the exercises being found to be important auxiliaries to the efforts of the drill-sergeant in 'setting up' the recruit. And the recruit has to perform some hours of drill daily while attending the gymnasium: the trained soldier is 'struck off' for gymnastics, and does very little of his customary duty at other times. In most essential points, however, the courses are not dissimilar; and in the case of the soldier who develops an aptitude for 'applied' gymnastics, every facility is given him both in the way of instruction, and in allowing private practice apart from the regular hour of 'school.' Most non-commissioned officers pass through the course along with their companies; but in addition to the usual routine, they meet at a separate hour for instruction in fencing, sword *versus* bayonet, and the like.

When a detachment, whether of recruits or of trained men, is 'struck off' to undergo a course of gymnastics, the first thing to be accom-

plished is to pass a medical examination. This, however, is not of a very searching character; for the officers or pay-sergeants of companies are usually careful not to present any man who appears to be weakly or has a record showing much 'hospital service.' As a consequence of this system of 'weeding,' the word 'fit' is inscribed by the doctor after nearly every name on the roll. Then follows the work of 'weighing-on.' The men are weighed and carefully measured in the nude state, a proceeding which is not inappropriate, considering that the word gymnastics is derived from a Greek adjective signifying 'naked.' On each successive day the exercises commence with running drill, which, weather permitting, is conducted in the open air—the 'runs' increasing both in distance and speed as the course progresses. Then comes a period of dumb-bell and bar-bell exercise, under the supervision of the sergeant-major. As discipline is maintained as though the men were engaged in ordinary movements of parade, this is gone through in no perfunctory fashion, and everything is done to word of command. Dumb-bell exercise over, the soldiers are divided into sections, each under an instructor, who marches his little band off to the ropes, the 'horses,' or the 'wall,' as the case may be. To one who had never previously entered such a 'school,' perhaps the 'wall' would offer a curious subject for observation. To the height of thirty feet or so it presents the appearance of a vast dovecot, being perforated by innumerable pigeon-holes. This wall has to be scaled with the aid of these holes, hands and feet being inserted in them in the ascent. The climbing, moreover, is not done in an independent or haphazard manner: the instructor draws up his squad at the foot of the wall, calls the men to 'attention,' and gives the word of command, 'Climb!' Hands and feet are then placed in the pigeon-holes according to the regulation method, which it would require too much space to describe adequately, until the top is reached, when the curious spectacle of some twenty men hanging midway between floor and ceiling is presented.

From the point where these pigeon-holes cease to diversify the surface of the wall of the gymnasium, a plank some eighteen inches wide stretches away in the direction of the 'mast' already mentioned; and it will be understood that this plank is at a very considerable elevation above the floor. The man nearest the plank with a certain amount of difficulty gets upon it, and warily walks along it towards the mast. This elevated walk is attended with at least some degree of danger, and there are always one or two men in a squad who can never be prevailed upon to venture along the plank. While about a yard and a half distant from the mast, it terminates. By this time the plank in rear of the man we are following is occupied by the rest of the squad, who have in succession scrambled upon it; and supposing our man to be a little nervous, his retreat is cut off. In front of him yawns a great chasm reaching down to the floor, and he cannot get hold of the mast from his somewhat unpleasant position on the extremity of the plank. But two ropes, each about an inch in diameter, hanging a yard apart, are suspended from the roof in the chasm, as we have

termed it; and the instructor, from below, calls to the nervous man how to proceed. He now seizes one of the ropes in each hand, and swings himself across the gulf to the mast, which he contrives to encircle with his legs. Then our gymnast leaves his hold of one of the ropes and gets his arm round the mast. To get the other arm round it is a comparatively easy matter, and he slides swiftly down the mast to the floor. It is right to say that the latter is covered with pretty thick mattresses, in case of accident. Mishaps, however, are almost unknown, though some difficulty is occasionally experienced in assisting the descent of men who have 'stuck' on the plank.

Another squad will meanwhile be engaged at the 'back-board.' This is a board fixed so as to form a very steep inclined plane, with handles along each margin. Leaning against the board with his back, the man, by an alternate action of his hands and feet on the handles, drags himself to the summit; and then, by a reversal of the process employed in ascending, returns again to the floor. The chief benefit to be derived from this exercise is the promotion of that squareness of shoulders so pleasing in the eyes of the drill-sergeant.

There are two 'horses' furnished with spring-boards to assist the act of vaulting. One of the horses is of no great height; the other is of somewhat imposing stature. The lower horse is used for elementary vaulting, which is at first done in two motions—the man springing upon it, and remaining there in either a standing or sitting posture for a moment, before leaping off on the other side; while the high one is for more advanced pupils, and indeed some practice is necessary ere it can be got over in anything like creditable style. Another variety of what may be popularly termed jumping is included in the curriculum of the gymnasium. A shelf some four feet square projects from the wall at a considerable distance from the floor. From this the men are required to leap, a mattress being placed on the floor to modify the concussion. The use of the 'shelf' is probably to give soldiers confidence in jumping from any unusual height.

A good deal of attention is bestowed on rope-climbing. The ropes, as already noted, are in the vicinity of the mast, and are four in number. To climb such a rope, when once the peculiar method of doing so has been mastered, is not a very difficult feat, and many men become expert in climbing who make but a poor show in other exercises.

The above examples may serve to give some idea of the exercises carried out in a military gymnasium. As the course proceeds, the men become much more dexterous, and are consequently able to overtake a far greater amount of work in the hour of drill. While at first almost the whole of the time may be consumed in getting a squad along the plank or over the 'horses,' towards the close of the course of instruction the same squad will make nearly a complete tour of the gymnastic appliances within the hour. But when this stage of proficiency has been reached, the date for 'weighing-off' is not far distant. And when the last man of the detachment has been weighed and measured,

the particulars being entered in the book, the sergeant-major turns over a new page and awaits the arrival of a fresh party to be 'weighed-on.'

THE DIAMOND THIEF.

FROM time to time the general public reads of some wonderful jewel robbery, and marvels at the sagacity of those thieves who prefer to turn their talents, often of the highest order, to a dishonest account, when they might make an honourable and profitable livelihood. But there have been one or two audacious robberies which have never found their way into the newspapers, from some cause or another best known to the losers. Some days ago we had the pleasure of meeting one of the partners in a wholesale jewelry business, dealing principally with the better class of West End shops, though they are always ready to accept a private customer. In course of time the conversation turned upon jewel robberies; and for something over two hours my new acquaintance kept us interested while he detailed more than one audacious plot by which the firm had suffered loss. After the silence which followed a tale of more than usual interest, one of the circle asked the narrator if ever private customers were tempted to rob them. The answer was the following story:

Of course we do occasionally have cases of that kind, said the narrator; though usually they are quickly detected. Occasionally an aristocratic customer—some one with plenty of money—is tempted to purloin a valuable ornament. You see kleptomania is a luxury which only the rich can afford to indulge in. I remember once waiting upon a lady in Park Lane with a rare lot of ornaments, out of which she selected some hundreds of pounds' worth. A diamond and Limoges enamel star, which she had particularly admired, was missing when I came to re-pack my cases. A younger man would have lost his head, and there would have been a scene, ending, perhaps, in a prosecution, which, let me tell you, under such circumstances would have done us incredible harm. But, as the Yankees say, 'I had been there before.' All I had to do was to make out a list of the things purchased and those kept for approval; the diamond star figuring prominently at the foot of the list. My customer looked at me a moment, half afraid, till I reminded her, as suavely as possible, that she had slipped it in her pocket in a moment of temporary abstraction. Of course she saw what I meant, and acknowledged her blunder very prettily.

But perhaps the greatest loss we ever had was in a measure due to one of the best customers of the firm, a member of the Upper House, with a town residence in Arlington Street, and no one knows how many seats and estates in

different parts of the country. Probably you all remember his daughter being married some four years ago—at St Peter's, Eaton Square, or the Savoy Chapel, I forget which, with a royal personage to sign the register, and wedding presents from Her Majesty downwards. His lordship is a very rich man, and his presents were worth a small fortune. But they cost him more than he anticipated.

I was in the counting-house one morning some two months before this marriage came off, discussing it with my partner, both wondering if we should have an order from the earl, when a slim-looking gentleman came in and laid a note upon the table. It was an order from the earl to repair at once to Arlington Street with a *parure* of diamonds, of which we make a specialty. I arranged to call a little later in the day, a fact of which I informed the slim gentleman. But towards the afternoon I received another note by the same hand advising me that his lordship had left town suddenly for M—— Castle, his seat in Leamshire, and that I was to come down there for instructions in the course of the following day. I remember being somewhat annoyed at the time, for I had an important family engagement on the morrow; but I had to swallow my impatience and inform the messenger that I would do myself the honour of obeying his lordship's commands. My partner was in the inner office, and it was my duty to show him the letter. Judge of my surprise when I could find neither of the earl's notes, though I distinctly remembered placing the second one upon the desk before me whilst I was giving the messenger my reply. I thought little of it at the time, though how their loss affected us afterwards you shall hear.

I went down to M—— the following day with more valuables than I have ever carried before or since. I must have had at least thirty thousand pounds' worth about me altogether. But I am not a nervous man, though men in my line have been robbed in a railway carriage before now.

I knew the earl very well by sight, though I had never had a personal interview with him before. I had occasionally seen him in the counting-house, and had listened to his peculiarly grating voice—a deep stern voice, with a rough rasp in it like the noise of a saw—a voice I could pick out amongst a thousand. I had no occasion to find fault with my reception: an elegant luncheon awaited me in the dining-room, and his lordship's own man—the slim gentleman aforesaid—was told off to administer to my creature comforts. He was extremely chatty and agreeable, without being the least forward, as 'gentlemen's gentlemen' too often are; and asked a variety of questions about my business, commiserating me upon the anxiety I must suffer in travelling the country with so vast and tempting treasures in my possession.

I will not detain you with the result of my interview with the earl and his daughter. I was fortunate enough to have in my possession the precise ornaments they required; and as I returned to town that night, well pleased with my journey, and the big cheque in my pocket, I congratulated myself that my treasures were so considerably lightened since the morning. It

was more than twelve months before I heard from the earl again.

It was one dull November morning, with a fog beginning to settle over the city, so dense that we had lighted the gas, though it was not long past eleven, when a visitor was ushered into the counting-house—no one else than the slim gentleman, who gave me a smiling recognition and held out a note for my perusal. I was somewhat astonished and not a little pleased when I saw that it was an order from his lordship for a *parure* of diamonds; in fact, almost the same order as I had received nearly eighteen months ago. In a jocular way I pointed out this resemblance to the slim gentleman. To my surprise, his face became grave, and he looked around cautiously, as if afraid of eavesdroppers, and coming a little closer, began in a significant tone: 'Of course you understand, sir, that confidential servants are often obliged to know things that it is as well other people should be ignorant of. Every noble family has its skeleton, and our family has theirs. Now, in the first place have you another suite of diamonds the counterpart of the others my lord purchased?'

I intimated that we had such another suite, as the earl must remember; but my visitor waived the question aside impatiently.

'You might possibly have sold it,' he said; 'and there is no time to make another. The fact is, Lady R——, who is staying with us now, must wear those jewels at a dance we are giving to-morrow night. And this is where the difficulty comes in, for they have been stolen!'

'Good gracious, you don't say so!—But why make a mystery of the matter?'

'Because we happen to know who the thief is!' said the valet, dropping his voice still lower. 'To a great extent I was instrumental in detecting the delinquent myself. It is a deplorable affair, a shocking affair—such a promising young gentleman too!—But I am saying too much, perhaps.—Mr ——, we must have those jewels at any price. If not, one of the highest families in the land will be terribly compromised. Do not be at Arlington Street later than half-past two.'

I always had a weakness for a mystery, and here was one ready to my hand. I could understand, from my visitor's little indiscretion, that some terrible scandal had happened, though I admired the fellow's cautiousness in checking himself before he had said too much. Under the circumstances, I need not tell you that my cab reached Arlington Street on the stroke of half-past two.

The drawing-room blinds were down; the shutters, too, all over the house, with the exception of the dining-room. In the clearer atmosphere it was fairly light, light enough to do without gas. In the dining-room a young man was standing before the fire, who pleasantly introduced himself to me as the Honourable Claude Y——, a name I knew well enough, though I had never seen the young gentleman before. In spite of his naturally amiable manner, I thought he seemed anxious and ill at ease, frequently breaking off in the middle of some observation to listen to the sound of voices, which came plainly enough from behind the thin ornamental partition dividing the two rooms,

and whence the earl's peculiar grating tones could be heard every now and then raised in something like anger. I could catch from time to time allusions to diamonds, and occasionally the word 'thief' was used in tones of immeasurable contempt. In the midst of this the door opened and the gentlemanly valet walked in. Even he seemed somewhat restless and uneasy, a circumstance I should scarcely have expected from a person of his unusually even temperament. He held in his hand an open telegram, and a letter for me, the ink still wet upon the envelope. I tore it open, and read that his lordship had suddenly been summoned to M—— Castle, the valet at the same time showing me the telegram, signed 'Mary.'

'You will have to go down to M—— to-morrow, sir,' he said to me; 'unless perhaps you have no objection to allowing the earl to take the jewels with him. However, for the present that matters but little.'

I immediately expressed my willingness to comply with this arrangement. With seeming reluctance, the valet took my bag, and presently I heard the sound of conversation resumed in the adjoining apartment.

'Thank goodness, there is a way out of it,' I heard the earl say.—'No, I will not look at anything else now. Take the bag back to Mr —— at once.—And, Evans, I must have a cab immediately.'

'You are usually cautious in your profession,' remarked the Honourable Claude to me, as I made a hurried inventory of various costly nick-nacks I had brought with me on the chance of a sale, for even confidential servants are not always to be trusted.—'Nothing missing, I trust?'

There was nothing missing, as I smilingly hastened to reply, though my answer was drowned by the rattle of a cab on the pavement outside. I heard the earl's voice in the hall admonishing the faithful Evans, and caught a glimpse of his well-known figure as he climbed into the cab. As the horse sped rapidly away, my companion heaved a voluntary sigh of relief.

'Of course you have guessed there is something wrong, Mr ——,' he said gravely. 'I am not at liberty to favour you with any details; but you will be doing us all a favour by observing a discreet silence concerning everything that you may have heard the last half-hour.'

Needless to say that I promised, also that I fully intended to adhere to that resolution. I stayed chatting with my aristocratic acquaintance for some time, considerably taken by his pleasant chatter and keen observation on men and things. Judge of my surprise when, on looking at my watch, I found it to be past four. I had already missed one appointment by my carelessness, and I excused myself hurriedly; and half an hour later I was back again at our counting-house in Hatton Garden. As I drove up, another cab stopped at the door, and out of it descended a figure which filled me with astonishment. It was the Earl of —— himself! He seized me hurriedly by the arm, contrary to his usual dignified manner and bearing, and almost forced me into the office. Once there, he lost no time in telling me the occasion for his errand, a narrative which, as it proceeded, more than confirmed my worst fears.

'I thought it best not to telegraph you,' he commenced; 'electric messages get into suspicious hands occasionally, so I came up from M—— straight here.'

'You have only just arrived in town, my lord?' I asked feebly. 'Do I understand that?'

'I reached Paddington scarcely half an hour ago. The fact is the jewels I had from you for my daughter have been stolen.'

'So I have been informed,' I replied mechanically, 'only half an hour ago.'

'So you have been told! Where on earth did you get your information?'

As coherently as I could, I told my tale; and fortunately was able to produce the two notes in evidence of my sanity, which up to this time had been open to argument.

The earl put on his gold-rimmed spectacles and read them with a judicial air. 'I am afraid, very much afraid, you have been the victim of a cleverly planned robbery. Yesterday morning Evans came to me and asked for two days' holiday, a favour which I need not tell you was readily granted. It was only last night that my daughter, who is staying at M—— with her husband, discovered by the merest accident that she had been robbed. Of course none of us suspected Evans. I should not have suspected it now, if I had not seen you; and my object in coming here was to get a technical description of the missing gems for the use of the Scotland Yard people. What a pity I did not come earlier!'

By this time I was in a frame of mind suspicious enough to make me suspect any one, including the earl himself. I pointed out to him, none too courteously, the fact of the letters, and my conversation with the Honourable Claude.

'I have a good memory, Mr ——,' said my visitor kindly, 'and I recognise these letters as the two I wrote to you prior to my daughter's marriage.—Evans, I understand, delivered both of them, and must have purloined them whilst your back was turned, with a view to this very robbery. It is true that I have a son Claude, only, unfortunately for your theory, he is at present with his regiment in the West Indies.'

'But I could have sworn to your lordship's figure as I saw you getting into the cab; and, pardon me, I could make oath to your voice amongst a million.'

'You recall a little circumstance I had quite forgotten,' the earl replied in amused retrospection. 'Evans, I regret to say, was uncommonly clever at mimicry; indeed, on one occasion I am informed that he presumed to counterfeit my dress and general style, even my voice, for the amusement of a select circle of friends, in a manner which filled them with astonishment. They say, like master like man, Mr ——; but it is very sad to see so clever a man so great a rascal.—And now, as I am in a measure the author of your loss, and as we are, moreover, comrades in misfortune, pray, consider my advice, need I say my purse likewise, at your convenience.'

We drove to Scotland Yard together and laid our complaint before the authorities. They were very wise and confident; but, as I imagined, the real culprit was never captured. The 'Honourable Claude' was picked up some few months later, but he turned out to be only a cat's-paw in the

hands of the older and abler scoundrel. But the astute Evans, the successful mimic, was never found; and those two splendid parures remain lost to the world to this day. But in consequence of the daring robbery being committed under his own roof, the Earl of —— insisted upon making good our loss, as a kind of penalty, he said, for placing a premium upon temptation.

'How did they get into the earl's town-house in his absence?' asked a listener when the narrative had concluded.

'That was the easiest part of all. Of course, the town-house was only used for a month or two in the year, and then left in charge of an aged caretaker, all the valuables being removed. If a confidential servant wished the use of a room for an hour or two, the rest is easily managed.'

'Were you not suspicious when you were asked to part with your valuables?'

'In a general way I should not have parted with them, not even to a relation of my customer; but the romance of the thing deceived me, the half-vested air of mystery, and above all, hearing the earl's voice* so close to me, and every stray word I could catch bearing upon the servant's cunningly told tale. Usually I am caution itself, but I was fairly "had" there.'

'I suppose the old chloroform business is quite exploded now?'

'Pretty well; for it is rather dangerous, you see. A man may be a bad subject for the drug, and again he may be armed. That kind of thing used to pay best in a railway carriage, like loaded cigars, and narcotics in a glass of wine. My railway-carriage experience was, however, of a different description. Another evening you may perhaps like to hear it.'

GUARDED LANGUAGE.

'I TOLD her she was the most ignorant person I ever met,' said the late rector of Lincoln of a young lady who had asked his advice about writing a book; 'but of course without hurting her feelings.' This, surely, is the acme of guarded language, and a great many of us would be willing to sacrifice much if we could only attain to such a superlative degree of perfection in the art of saying unpleasant things without being unpleasant. Few persons, however, can do this; and they have, therefore, either to avoid matters likely to give offence, or to use rather ambiguous language.

Everybody knows that religion is a dangerous topic. Sir John Macdonald, the Canadian Premier, once astonished his friends by defending the orthodox side of certain points of theology. Finally, one of them asked: 'Sir John, what are you—heterodox or orthodox?' to which the statesman replied: 'Put me down paradox!'—a reply at once clever and witty. The answer to a somewhat similar question, that 'All wise men are of the same religion,' is attributed to several eminent men. Mr Froude, in his *Short Studies*, gives the following version of the anecdote, without, however, quoting his authority. 'Of what religion are you, Mr Rogers?' said a

lady once.—'What religion, madam? I am of the religion of all sensible men.'—'What is that?' she asked.—'All sensible men, madam, keep that to themselves.' Somewhat similar is an anecdote told in a note by Speaker Onslow to Burnet's notice of the Earl of Shaftesbury in the *History of his Own Time*. A lady called upon the Earl one day, and at last the conversation turned into a dispute upon subjects of religion. 'After a good deal of that sort of talk,' the note proceeds, 'the Earl said at last: "People differ in their discourse and profession about these matters, but men of sense are really but of one religion." Upon which the lady says of a sudden: "Pray, my lord, what religion is that which men of sense agree in?"—"Madam," says the Earl, "men of sense never tell it!"'

Literary criticism upon books privately presented with the compliments of the author, and with the request for an opinion upon the book, is proverbially a difficult task. Sometimes, however, the matter cannot be altogether shirked, and if the book under criticism be really bad, it requires some tact to avoid saying so outright. Max O'Rell gives an instance of how one gentleman overcame the difficulty. An English author had sent his latest production to several men of letters, requesting them to give him their opinions of his book. A Scotchman replied: 'Many thanks for the book which you did me the honour to send me. I will lose no time in reading it.' This reply acknowledged the letter and the book, without expressing any opinion as to the merits of the latter. The habit of authors importuning literary men for advice has been the means of originating many famous guarded answers, the most important of which was that given by Sir Thomas More. An author having asked his opinion of a book, Sir Thomas told him to turn it into rhyme. He did so, and submitted it again to the Lord Chancellor. 'Ay, ay!' said the great satirist, 'that will do, that will do. 'Tis rhyme now; but before, it was neither rhyme nor reason.' Johnson's answer on a like occasion was deliciously vague. When the great talking philosopher had done reading a translation of some work, the author, says Boswell, 'asked him bluntly, "if, upon the whole, it was a good translation." Johnson, whose regard for truth was uncommonly strict, seemed to be puzzled for a moment what answer to make. As he certainly could not honestly commend the performance, with exquisite address he evaded the question thus: "Sir, I do not say that it may not be made a very good translation."'

During the last half-century there has been a great increase in the use of guarded language. The present generation deals largely in euphemism and periphrasis. In the House of Commons the members are allowed to use any euphemism they like for liar, but they must not, as *Punch* said, use the good old Saxon word. In literature, too, there has been a great toning down of phrases. We have no 'slashing' reviews nowadays. 'Drivelling nonsense,' 'murderous attacks on his own literary reputation,' 'than the volumes now before us we never saw anything better calculated to excite disgust and anger in a lover of poetry,' 'insufferable stuff,' 'inanities'—these are a few literary gems culled at random from reviews

directed against Scott, Byron, and Wordsworth. What language was employed with regard to the productions of the smaller fry it is difficult to imagine. All this kind of criticism is, however, now dispensed with; and the present mild system of reviewing is much more satisfactory, and, in the case of a bad book, accomplishes just as much as the abusive language of a past generation. 'Who,' asks Thackeray, 'was the blundering idiot who said that "fine words butter no parsnips?" Half the parsnips of society are served and rendered palatable with no other sauce.' And as these fine words are calculated, and this two-edged language is allowed for, there is no harm done, and not the slightest misunderstanding.

Even the beggars, according to a well-known author, are becoming adepts in the use of delicate language. A man asked the narrator of the incident for alms. 'You have a violin there,' he said, 'but you do not play it.'—'O sir,' was the reply, 'give me a penny, and don't make me play. I assure you, you won't regret it!' Clearly, it was impossible to resist an appeal of this sort.

It has frequently been noted that the New Englander is very cautious in his language, and that he rarely gives a direct answer to a question. A gentleman said to a friend whose family were not noted for very active habits: 'Was not your father's death very sudden?' Slowly drawing one hand from his pocket and pulling down his beard, the interrogated cautiously replied: 'Waal, rather sudden for him.'

LOVE AND THE WORLD.

SWEET is the evening breeze
That whispers through the trees
Low lullabies;
Sweet is the rosy light,
Lingering o'er cloudlets white
As the day dies.

Each old familiar sight
Brings me new joy to-night,
And strange surprise;
Fair is each half-closed flower
At this calm evening hour,
As the day dies.

Because Love came to me,
And granted power to see
With clearer eyes;
Because, no more alone,
I am with thee, my own,
As the day dies.

My life's last sun must set,
Dearest, ere I forget
Such memories;
How shall I wish to live,
What can the future give,
When *this* day dies?

RAILWAYS AND FAST TRAVELLING.

THE conditions of speed and safety which characterise railways at the present time have not been obtained without much thought and most expensive experiments, until the nearly perfect system of working them has grown almost to a science. In the early days of railways the method of signalling for stopping a train at a station was a flag or movable board by day, and a candle placed in the window at night; but in the course of years an elaborate arrangement has been devised. On entering a signal-box, the spectator is bewildered by the number of bells, needles, instruments, and long rows of bright levers, all conspicuously numbered and named. The latter have been aptly compared to the keyboard of an organ; but with this difference, that the organist can produce discord at will, while with the railway signallist, discord or a mistake is barely conceivable; for he cannot open the points to a line, and at the same time show a safety signal to another line crossing it. Every line is in a manner under lock and key, for when one is opened, it secures by the same movement of the lever all those from which danger can come. This result is effected by mechanism of great simplicity; while the separate levers, with their signals, are so arranged that a mistake is practically impossible. Even when signals are out of view from the signal station, if at night a lamp is broken and the light extinguished, a very simple but effective electrical apparatus rings a bell and operates a signal in the office giving immediate notice.

Still further to ensure safety for trains in motion, continuous and automatic brakes have been brought to great perfection. The Board of Trade has enforced their use, and Railway Companies have expended large sums of money in bringing them to their present state of excellence. It is not many years since, that a train, running at forty-seven and a half miles an hour, could not be brought to a stop within twelve hundred yards' distance and eighty-six seconds of time, and this with the best appliances then in use.

In the competition at Newark-on-Trent a few years ago, a train of the same weight and speed, but fitted with Smith's Vacuum Brake, was pulled up in four hundred yards and in twenty-six seconds—a saving of nearly half a mile in distance, and sixty seconds in time. A single second in railway practice means a great deal, for at sixty miles an hour it may mean eighty-eight feet from fearful disaster. Trains have been known from the failure of a coupling screw to get divided, some of the carriages being left behind; and in this case, the automatic brake, if in operation, comes into action on both portions, giving the conductor and driver instant notice.

Ninety per cent. of the railways in England are now worked by the interlocking and block system. Without this safeguard, it would be impossible to work lines where a great many trains pass in rapid succession, as on the Metropolitan, which has a train passing every two minutes. Here the signal stations are necessarily very close to one another. When a train arrives at a station, the signallist controls the section behind by giving notice of arrival, and again of its departure, and forward in the same way. Signals thus precede and follow every train throughout its course; and in this way no two trains can ever be on the same section at the same time. The telegraph and signals are so connected in working the trains, that they may be compared to the nervous system of the human frame controlling the movements of the body.

In view of all these precautions to make railway travelling perfectly safe, and that, too, while extensions are continually going on—with a greater and ever increasing number of trains of all kinds running with accelerated speed—it is gratifying that railway accidents have diminished in number about sixty per cent. In 1882, the chairman of the London and North-western stated that there had not been a single passenger killed on their line within the previous three years. Sir John Hawkshaw, speaking of safety on railways generally, said 'that only one passenger was injured for every four million of miles travelled;

and on an average a person may travel one hundred thousand miles each year for forty years, and the chances are of not receiving the slightest injury.' Again, Sir E. Watkin 'maintained that railway travelling was safer than eating, because it is a fact that more people choke themselves in England than are killed on all the railways of the United Kingdom.' Further, it is quite clear that with appliances so perfect, it would now be possible to start a fast train on the most crowded railway, worked on the block system, without any previous warning along the line; and yet it would pass through with safety and without causing any derangement of traffic. It is a wonderful consideration connected with the fast express service of this country that all the railways are so nearly equal in speed, although the general opinion is that the Great Northern, with a running average of fifty-one and a half miles an hour, steadily maintains the fastest time; while the regular equality of running and punctuality shown by the London and North-western Railway cannot be surpassed. It is on two of the three routes between London and Edinburgh, called the East and West Coast routes, that the Companies which compose them seem to put forth their greatest efforts. The East Coast is the shortest route, and is generally more favourable for speed; while the West Coast line, besides being eight miles longer, has several hills to climb; and it is evident that the motive power of the engines employed is nearly taxed to its utmost limit, more especially if we read aright the lesson of last year's famous race from London to Edinburgh.

The race referred to has marked an epoch in railway travelling, and a brief résumé of its most noticeable features may be interesting here. There are three routes between London and Edinburgh, as stated: (1) The East Coast route, which runs over the Great Northern, North-eastern, and North British lines; (2) the West Coast route, composed of the London and North-western and Caledonian lines; and (3) the Midland, including the Waverley Route, which, being a longer line and more difficult to run over, took no prominent part in the race. For some years, a train familiarly known as the 'Flying Scotsman,' had been running between London and Edinburgh over the East Coast route, and doing the distance, 392½ miles,* formerly in ten, and latterly in nine hours. The express-trains on the West Coast route started from London at the same time (10 A.M.), and took ten hours on the journey, 400½ miles, being one hour more than its rival.

This was the condition of things until the approach of the tourist season last year, when the West Coast line gave notice that after June 1st trains would run from Edinburgh to London, and *vice versa*, in nine hours, that being the same time

as on the East Coast line. The East Coast replied by giving notice that from 1st July the time would be reduced to eight and a half hours; and the West Coast made a similar reduction of half an hour, arriving in Edinburgh at 6.30 P.M. The East Coast Companies were now so eager to retain the supremacy for speed, that they still further reduced the time, and on August 1st, the Flying Scotsman was in Edinburgh at six P.M. Five days later, August 6th, the West Coast train ran the 400½ miles in eight hours, including stoppages. Another four days passed, and the Flying Scotsman reached Edinburgh at 5.45 P.M., or seven and three-quarter hours. Three days later, August 13th, the West Coast train was in Edinburgh at 5.38 P.M.—400½ miles in 458 minutes, including stoppages, actual running time 427 minutes. The day following, the East Coast train reached Edinburgh at 5.31 P.M.—392½ miles in 418 minutes actual running time. On the 28th of the same month the East Coast train reached Edinburgh at 5.28 P.M.; and on the 31st at 5.27 P.M., or in 414 minutes of actual running time. This may be said to have ended a contest giving results such as the world had never before seen. Both lines have since covered the journey in eight and a half hours.

Some of these runs were unprecedented. We have seen short runs at as great if not higher speed; but these were long runs, made day after day, with little or no variation, and free from mishap or accident of any kind. On the West Coast line the run from Euston to Crewe, one hundred and fifty-eight and one-eighth miles, was done in one hundred and seventy-eight minutes, a continuous speed of nearly fifty-four miles an hour, and said to be the longest fast run ever made in the world without a stop. The West Coast Companies ran the four hundred and one-half miles in nineteen minutes less than the advertised time; during which the Caledonian train ran from Carlisle to Edinburgh, one hundred and three-quarter miles, in one hundred and two and a half minutes; and when we consider that this included a flight over one mountain ten hundred and fifteen feet, and another eight hundred and seventy feet high, we are safe in saying nothing like it in railway work was ever done before. It was followed next day on the same route by an equally remarkable performance. The London and North-western portion of the route from Preston to Carlisle, ninety miles, was run in eighty-nine minutes, including a thirty miles' run over the Cumbrian hills, nine hundred and twenty feet high. On the East Coast route, even keeping in view that it is a much easier line to run over, some remarkable results were also obtained. The run was made from Newcastle-on-Tyne to Edinburgh—with two engines—one hundred and twenty-four miles in one hundred and twenty-three minutes. Taking the length of the runs into consideration, these results are altogether unparalleled. Competition of this kind will certainly add to our experience in many ways, and teach us possibilities that could be obtained in no other manner.

No special preparation for accelerated speed had been made. The engines were those in daily use; and except that the number of carriages was reduced, the trains were in all respects the same as those which had been running the ordinary

* The actual distance is 392½ miles; but the railway mileage is calculated at 393½—the extra mile being given by the Railway Company by statute, to compensate them for the extra expense of the high-level bridge at Newcastle-on-Tyne.

express. There is no doubt that much more powerful engines could be built to run at a greater speed with heavier trains; and it has been matter for surprise to many that Mr F. W. Webb, engineer of the London and North-western Railway, did not run his compound locomotives; for if steam is to hold its place as the motive-power of the future, then the compound locomotive will be the engine of the future on railways. It is said to be, when running at high speed, comparatively free from that oscillation which is so destructive to the permanent way, while it gives greater power with much less consumption of fuel. But the engines which have been made at Crewe of this type are as yet designed only for heavy trains, and their great tractive power would have been wasted, while their wheels are too small for great speed.

On merely local lines, where haste is not so great a consideration with passengers, the mere rate of speed does not become so pressing a question; but in the case of great through lines—those lines that are, as it were, the main arteries of the railway system, and which carry passengers long distances—the rate of speed is a matter of great importance. And the public appear to encourage this haste. As a mere question of Speed *versus* Safety, it has been remarked that if two lines were laid alongside, one to run at forty miles, the other at thirty miles an hour, with the advantages of greater safety and punctuality which the slower speed would give, the great majority of passengers in the United Kingdom would choose the faster train, and run any risk to save a few minutes on a journey, even although the time saved may have no special value on arrival.

The comparison of our special trains with those on the Continent shows greatly in our favour both for speed and punctuality. In fact, the only really fast express trains run in France, Belgium, and Italy are those which are in 'correspondence' with ours; and in general, they are from five to ten miles an hour slower than ours; or a running average of thirty-five to forty miles an hour. In the United States some of the fast trains are not much behind ours in speed; at the same time, whether from the long distances or from the generally inferior condition of their lines, they have no trains which will at all compare with those of this country in punctuality and regular speed, with freedom from accident. There are many things connected with high speeds on railways which tax the ingenuity of locomotive engineers to the utmost. The lines have to be made strong enough to withstand the heavy blows of the locomotive, for the other portions of the running plant are light in comparison. A railway train at sixty miles an hour may be compared to a huge projectile, and subject to the same laws. The momentum is the product of the weight of the train multiplied by the square of the velocity in feet per second; and if we allow a train of one hundred and twenty tons, travelling at a speed of sixty miles an hour, then the work required to bring it to a standstill would be fourteen thousand four hundred foot tons exerted through one minute, or nearly a thousand horse-power, which gives some idea of its destructive force if, unhappily, it should come into action; and yet this terrific power is so

entirely under command, that the strength of a child turning the small handle of the vacuum brake can bring the train to a stand in a few seconds.

There is no doubt railways and locomotive experience have revolutionised many of our established theories and ideas of what was suitable and possible in mechanical motions and structures; and in this way one of the most important of the sciences, dynamics, has been better understood and established. In fact, every improvement in railways, while adding to the comfort and safety of passengers, seems to open out new avenues to still further improvements and to create new requirements. There is much left that might have been referred to here, such as the electric light and signals, communication between passengers and conductors of trains, &c.; but perhaps enough has been mentioned to show that every week Railway Companies are honestly and successfully trying to make railway travelling safer and more attractive; while, as the late John Bright said, 'railways have rendered more services and have received less gratitude than any other institution in the land.'

JOHN VALE'S GUARDIAN.

CHAPTER XVIII.

SNELLING rode home, revolving these and other matters in his mind. He was filled with a stolid wrath against Isaiah. 'He was always an impudent feller,' mused Mr Snelling; 'but I never thought as he would turn agen me and take up with a parcel of foreign strangers. I shall have to be rid of him. I'll have no teller round me as work agen me behind my back.'

He was not a clever man, or shrewd at reading other people's motives; but even whilst he pretended to be struck with wonder at Isaiah's treason, he understood his motives perfectly.

'They keep the lad away from me,' he growled inwardly, 'as if I'd meant him a mischief. What harm, I should like to know, should I ever ha' done the boy? He's my own flesh and blood; and his father's last words was to say as he expected me to take good care on him. Me hurt the lad? What had I got to hurt the lad for?'

His clumsy mind put on airs of virtuous indignation, and he told himself whatever seemed likely to influence the judgment of other people. In a while it all began to seem reasonable, and even impregnable.

'Here's that Isaiah, as my father bred from a boy, been spreading evil reports and thinking evil things about his gaffer.' He felt dimly a mingling of scorn and pity for Isaiah stir within him. 'I should ha' thought better of him; I should ha' thought Isaiah would have acted square; I should ha' fancied as Isaiah would have come to me plain and straightforward.' He shook his head mournfully over his servitor's moral shortcomings, and jogged on, nine-tenths persuaded of his own rectitude. 'For two pins I'd warm his jacket for him.'

Here came reflection, and the current of his righteous wrath grew cool, and began to roll sluggishly. If he parted with Isaiah suddenly, it

would take him a month or two to seize and gather up all the business threads which would be left loose. He began to cast about in his mind for excuses for delaying the faithless servant's discharge, and finding none, saw more clearly than ever how ill-used he had been. It was awkward to part with a trusted servant in such a way that he could force from him nothing but a formal surrender of his trust. In his business habits, Isaiah was kindred with the mole—he liked to work underground. He would make slow, tentative approaches towards a bargain, and Snelling knew from old experience that he might have half a score of profitable little business enterprises almost ready, about which, if he were abruptly dismissed, he would naturally say nothing. These reflections, of course, made Isaiah's treason only the more obvious, and his own attitude of righteous anger the more tenable.

Isaiah was not at home; and his injured, wrongfully suspected employer sat down in wrathful patience to await him. He dismissed to bed the servant who admitted him, and sat over his sober glass of grog and his pipe in a severity which grew momentarily more and more magisterial. To vindicate his own outraged honour, he would have to suffer pecuniary loss; but he was prepared to bear it. Slowly there grew up in his mind the image of Robert Snelling, British yeoman to the core, generous, well-meaning, the holder of a solemn trust, who meant at any cost honestly to discharge it, and who had been traduced by a vile suspicion. Curious as it may seem, he grew actually to believe in this personage, and the only note in all his thoughts which jarred with that belief rose in a murmur so faint as hardly to be audible to his inward ears: 'There's nobody in the world as has got a grain of evidence agen me.'

He sat late into the night, and there still being no sign of Isaiah, he locked and chained the front door. Then returning to the room in which he had been sitting, he scrawled the words, 'Half-past seven' upon a sheet of paper; and leaving this in the centre of the table, went up-stairs to bed. That sterling figure of the British yeoman looked altogether credible to his mind. The monster who would have attempted to injure his own kith and kin grew altogether improbable, unbelievable, and he fell asleep in the consciousness of his own unblemished reputation.

He was awakened at the hour he had indicated, and having breakfasted, attired himself with as scrupulous a care as he had displayed the night before.

Mrs Winter appealed to him for news of Isaiah.

'I don't know where your man is, my good woman,' Snelling answered; 'but I can go so far as to tell you that I do not care. If he was only aware of it, he's not the best o' reasons for keeping out o' my way. If he comes back doorn' my habesence, you can tell him as I've found him out. I fancy he guesses as much already.'

'I'm sure, Mr Snelling,' said Isaiah's wife feebly, 'as Isaiah's done nething as he knows to be wrong.'

Mr Snelling's only answer was a scornful grunt. His good woman was too much afraid of him to enter her inquiries further, and he left her in a mood of mind. He rode into Castle-

Barfield; and having seen the mare comfortably stabled at an inn, made his way to the railway station, and in due time took train for Warwick. Isaiah's all-night absence seemed strange to him; but he did not as yet connect it with Orme's appearance, and was fully persuaded that he was about to take by surprise the foreigners who had harboured his ward. He found with very little difficulty the street they lived in, and identified the house at once. He sounded an important summons at the door, and Madame Vigne answered it. The two looked at each other for quite a considerable little time without speaking. The colour in Madame's plump cheeks had all drawn into two hectic-looking spots. Her lips were tight set, and her eyes sparkled dangerously. Snelling was prosperous rustic dignity all over, and having no nerves to betray him, he was by far the more self-possessed of the two.

'Well?' said Madame brusquely, when she had inspected the stranger so long that her own silence had made her feel awkward and embarrassed.

'I want a word or two with you, ma'am, if you please,' said Snelling, mounting the first step of the snow-white little flight of three which led to the doorway.

'Will you be so good as to enter?' said Madame, standing on one side to make way for him. She was as ready to fight for the children as a hen for her chickens. She would have fled from a mouse in abject terror, but for a mere man she had no fear.

Snelling marched in solidly; and Madame, closing the door behind him, led him to the sitting-room. The apartment was furnished sparsely, rather after the continental fashion than the English, and gave the untraveller man a false estimate of the people with whom he had to deal. A little foreign-looking man, spare and dark, with jet black hair and eyes, and teeth that flashed like ivory under his moustache, rose as he entered the room and bowed. The little man held a small-sized sketch-book in one hand and a pencil in the other, and when he resumed his chair, as he did immediately after his salutation, he sat toying with these whilst Madame placed a seat for the visitor. Snelling waved it away, and Madame gravely took it for herself.

'Your name, sir?' she asked.

'Robert Snelling is my name.'

'Pardon,' said the little man from his corner.

'You do forget, sir. Your hat.'

Snelling took off his hat and laid it on the table; and Madame followed up her first question.

'Your business?'

'My business, ma'am,' said Snelling, 'is very easily stated. I am the guardian of a youth—a young youth,' he added, so that there might not be any mistake on that point, 'by the name of John Vale. He was so misguided as to run away from home a twelvemonth back, and I'm given to understand as he's been living here. I want to see him.'

The long drawl of his speech, with its decisive and authoritative snap here and there, had the same kind of deliberate weight here which it always carried. The ponderous figure, the respectable dress, the clean-shaven face, the very bunch of old-fashioned seals he played with as he spoke, all helped. He stood there like a picture

of British respectability. Jousseran and Madame Vigne had vaguely expected to encounter somebody quite different—something meaner, smaller, more cunning.

'The boy is not here,' Madame answered.

'That is as may be,' replied Snelling; 'but here or no, I have reason to believe that here he has been, and I want him delivered over to my care.'

'Yes,' said Madame, 'I suppose so.'

The little dark man in the corner laughed; and Snelling's attention being drawn to him by the sound, he grew aware of the fact that the coal-black eyes were fixed upon him with an unusual wary intenceness which he could not fathom. As a matter of fact, Achille was sketching the visitor, and was studying his lineaments for that purpose; but Snelling felt the gaze to be at once penetrating and insolent, and repaid it with a scowl of dogged anger.

'I suppose you are aware, m'ain,' he said, turning to Madame Vigne, 'that by the law of this country you have no right to take a boy away from his natural and proper guardians?'

'From his natural guardians, yes; from his proper guardians, yes,' said Madame; and Jousseran gave an approving grunt at the close of each brief sentence.

'The futher of this youth,' said Snelling, 'was my first-cousin. He trusted the lad to me on his deathbed, and he trusted him to me by his last dying will and testament. I am his lawful guardian; and, moreover, the lad has his rights as well as I have. It doesn't take much to understand what you mean. The lad will be well-to-do one of these days, and you have some hopes of keeping hold upon him.'

'That,' said Madame Vigne, 'is a wicked lie.'

'I am not here to bandy words with you, m'ain,' said Snelling, with his best air of dignity; 'I am here to claim my rights. I have the law behind me, and if you resist, you'll suffer.'

'We know,' said Madame Vigne, 'why you want the boy again. You want him to ill-use, to frighten, to make him so that his poor little brains will work not; to make him so that you can say, "He is an idiot; he cannot use his money. I will take care of it for him for good and for always."—Oh yes, we know why you want the boy; and we know why you will not have him. You speak of the law? I speak of the law. The law is good and sensible; the law is generous and wise. You cannot frighten us with your law.—What! You say I shall be punished for taking a poor heart-broken little child and helping him. I feed him, clothe him, love him, make myself in all things his mother, and I am to be punished? Oh! a likely story. And you, you take him from his father's hands, you break your promise to the dead, you try to crush the poor little brain and the frightened heart, and you—you shall punish me!'

Madame was up, and in the whirl of her excited progress to and fro about the room had overturned a spindle-legged table and a chair or two. She took no heed of these things, but wound up her oration face to face with Snelling, seeming so to threaten him with the vehement French gestures of her hands that he fell back a pace or two.

'Are you mad, woman?' he asked when she

paused from mere want of breath. 'I hurt the lad? What cock-and-bull tale is this? I never laid a finger on him in my life.'

'You made others do it,' she flashed back at him.

'You're a knowing kind o' person, you are,' he answered slowly; 'you know more about my affairs than I do. I tell you again there's law in this country, m'ain. You shall prove your words before you're done with me. It's come to this, has it? A blameless man's character's to be took away by a pack o' foreign trappers coming from no man knows where, and going no man knows whither.—Find the man that says these things about me, and I'll flog him within an inch of his life.'

'Oh! you are big,' said Madame; 'but we are not afraid of you.—Achille, tell Mr Vintaro to come here.'

Isaiah's entry at this moment was so strikingly appropriate that it seemed more than probable that he had been listening at the door.

'You're here, are you?' said Snelling.

'Yes, gaffer, I'm here,' Isaiah responded.

'It's you,' said Snelling, 'that's been setting flying these reports about me.'

'I've set no reports a-flying,' Isaiah answered; 'I've believed 'em maybe.'

'Believed 'em, have you?' said his employer.—

'Look me in the face, Isaiah Winter. How long have you been i' my service, man and boy, and in my father's service afore mine?'

'A matter of thirty year,' returned Isaiah.

'Did you ever in all that time know me to do a man a wrong?'

'Nothing onlegal,' responded Isaiah guardedly.

'Did you ever know me want a penny as belonged to another?'

'The law's always been o' your side.'

Snelling, finding his witness thus refractory, tried another tack. 'You lived i' the same house with John and me from the time of his father's death forward, till he was that misguided as to run away.'

'I say nothing about misguided, gaffer.'

'You lived there all that time?' Snelling demanded.

'I lived there—yes.'

'Did you ever know me raise a hand agen the lad?'

'I've seen you mek him cry five hundred times.'

'How, and what for?'

'The what for's best known to yourself, gaffer.'

'Very well,' said Snelling. 'It's pretty plain where all these stories come from. I shall see my lawyer i' the morning, and I shall make you prove your words.—You as well, m'ain.—Mean-time, you'll do what you like about the lad. You own as he's been here, and as good as own that you know where he is. You'll have to hand him over, and I'll see you punished as far as the law can go, if I spend a thousand pound.'

'All right,' returned Isaiah. 'If I'm to be hanged, I'll have my money's worth; and I tell you to your face I misliked Farmer Vale's will from the very hearing of it. I never thought you the man to be trusted with a soft-headed lad as had got such a heap o' money.'

Snelling looked down at him sternly. 'You

mean to tell me, Isaiah Winter, that believing me to be a man of that sort, you stopped in my employment? Why, you ought to be ashamed of yourself.'

'Well, now you come to remind me of it, gaffer, so I am.' Isaiah thought so highly of this retort that he nudged Jousseau to call his special attention to it.

'Very well,' said Snelling. 'I can trust my neighbours; I can trust my record. I've done the square thing from the time as I can first remember, and no man's got the right to wag a finger at me.—You've got the sack, you have; and we'll see whether a discharged servant's word is good agen my own. You've got yourself into mischief, my lad, and I'll give you cause to remember this day as long as your life lasts. Why, you silly fool, who do you think's going to believe your story? Who's going to back it for you?'

'All the lads in Macfarlane's school is going to back it,' said Isaiah.—'D'ye think folks'll believe Macfarlane 'ud ha' leathered the lad as he did, in his father's lifetime?—D'ye think as he'd ha' dared to do it agen a man like you without he'd had the word to do it?'

That shot went home, and for a mere instant Snelling stood confounded. 'Good!' he said, recovering himself. 'I shall see my lawyer before I make a move; he'll teach you a thing or two.—Good-morning to you.'

He could not convince himself that he had made any great impression upon his auditors. The figure of perfect rectitude which he saw so clearly seemed invisible to them. But for himself the interview had done something. He had formulated his figure, had given it bulk and outline. He was permanently certain of himself. He had meant well from the beginning. The actual dark knowledge that he meant evil now did nothing to flutter his peaceful fancies.

(To be continued.)

THE HIGHEST WATERFALL IN THE WORLD.

NEW ZEALAND can still boast of one natural celebrity, which will compensate in a measure for the loss of those unique marvels of nature, the Pink and White Terraces, which were so suddenly destroyed by the disastrous earthquake of 1886. The credit of the discovery of the stupendous waterfall, which is still unknown to the world at large, but which is now found to be the highest of any hitherto brought to light in any other portion of the globe, rests with a Mr Sutherland, a well-known explorer of the west coast sounds, who has taken up his mode for many years amid these surroundings of solitary grandeur, far from any inhabited portion of the country, in a part of New Zealand still inaccessible except from the coast. Here he lives alone with Nature in all her primitive splendour, receiving news only from an occasional passing ship, unless, perchance, another wandering spirit come across him in his wanderings in this picturesque region of magnificent scenery.

A few months ago, a small party of gentlemen of scientific tastes started on an expedition, not free from danger, with the object of reaching and, if possible, measuring and fixing the position of the Sutherland Waterfall, so called after its discoverer, who up till then was the only human being known to have accomplished the feat. The first step on their journey, Milford Sound, was reached on the 27th of September, and here were landed all the necessary *swags* (the colonial term for a knapsack), and provisions, together with material for a canvas boat for use inland in crossing Lake Ada. The following account of their adventure is taken from notes by one of the party, Mr Mackenzie, M.H.R., and published in the *Otago Daily Times*.

In passing, we must mention that the grandeur of this spot can hardly be realised by those who are not acquainted with the New Zealand bays. Lovely as is the peculiar beauty of the Swiss Alps, and reminded as one constantly is in this country of the unspeakable charm of its picturesque valleys and snow-laden mountains, yet there is an immeasurably awe-inspiring grandeur in this unknown region, where the footfall of man is unheard, and the only sounds are the songs of strange and beautiful birds, and the rippling or roar of waterfalls and courses. There is, too, a beautiful fall of water in Milford Sound, of which till now we have felt proud (Bowen Fall, now measured by Mr Adams as five hundred and thirty feet). 'My first glance at this, after misty rain, which still hung in clouds obscuring the tops of the mountains, was truly magnificent, the water appearing to pour down from the shadowy clouds which encompassed it. It was in verity an artist's dream.'

From Milford Sound our party proceeded to Lake Ada, to which stores, *swags*, boat, &c., had to be carried bodily through the bush; no easy undertaking, through its unyielding and prickly tangle. However, the lake was reached; and next day saw the frail canvas craft put together which was to carry the adventurers across it. This trip, says Mr Mackenzie, proved a very dangerous one, the whole surface of the lake being a mass of snags. Accounting for this, he says that at some early period a heavy avalanche is supposed to have come down and formed a moraine across the mouth of the Arthur River, 'thus transforming a comparatively level flat of high birch-trees into a lake of from ten to forty feet deep. The trees have decayed between the air and the water-line, the water preserving the timber, so that now the lake simply bristles with the sharp-edged tops of huge trees, some a foot above water, others six inches; some just tipping the surface, and others at all depths. The wind was blowing a little fresh, just causing a ripple sufficient to prevent our seeing the submerged points. As a consequence, we were continually getting on to them; but fortunately none came through, although the sixteenth of an inch of cotton canvas was all that was between us and them. The lake is about four and a half miles long by a mile to a mile and a half wide. On either hand, huge mountains rise almost perpendicularly from the water's edge, covered with snow and ice, and waterfalls come tumbling down on all sides. On the right, Terror Peaks and Giants' Gates (seven thousand feet) are the most remarkable features. Ducks of every

variety skim upon the surface of the lake, such as paradise, blue mountain, gray, and teal. These abound, and pay little heed to strangers. Several gigantic mountains—among them the Castle, the Danger, Mount Hall, and Mount Daniel—surround us, rising from six to seven thousand feet high; and we saw some fine avalanches coming down the Barron slopes with a thundering roar. Several rivers fall into the head of the lake. We selected the centre one, which turned out to be the Poseidon; and after rowing about two miles up, night coming on, we camped.

Our narrator goes on to say that next day he and another of the party, Mr Pillans, pushed on to their destination, following the course of the Poseidon river, and came across the 'Hermit of the Sounds,' Mr Sutherland, who accompanied them to the foot of the falls, about eight miles from where they left their boat, telling them that, with the exception of himself, who had known it as far back as ten years ago, they were the first persons who had reached that spot. 'I must leave to some able writer,' Mr Mackenzie says, 'the work of picturing to the world in suitable language the grandeur of what will soon be known as the highest waterfall in the world. It consists of three leaps in an almost direct line; but when standing about a quarter of a mile away, it has the appearance of a straight leap with two breaks. The two upper leaps are equidistant, and the lower one shorter.'

From a more detailed account in the *Otago Daily Times* we take the following: 'The water issues from a narrow defile in the rock at the top of the precipice; it then makes one grand leap of eight hundred and fifteen feet into a rocky basin on the face of the cliff; issuing forth once more, it makes another fine leap of seven hundred and fifty-one feet; and then goes tumbling headlong in one wild dash of three hundred and thirty-eight feet into the pool right at the foot of the precipice. It will thus be seen that the total height of the fall is nineteen hundred and four feet, thus making it the highest waterfall that has yet been discovered in the world. Proceeding right on to the pool at the foot'—hewn out, we are told, by the heavy fall of water from the mound of stones and debris projected over in times of flood—'at the expense, however, of getting drenched with the spray, a splendid view of the whole is obtained; and when the sun is shining, the effect is enhanced by a beautiful rainbow of colours of the most brilliant kind conceivable. This bow is nearly a full circle; and the closer you get to it, the smaller it grows, till it is right in front of your face—a brilliant-hued ring a yard in diameter.'

Mr Adams—organiser of the party, and chief surveyor, who got through a great deal of surveying-work during the expedition—greatly admired this beautiful phenomenon, and said if one approached it nearer so as to encircle the head, one could imagine one's self a halo-crowned saint entering paradise. Unlike most falls of great height, this one does not fall in spray, on account of the great volume of its waters, and consequently it comes down with a tremendous roar. Just beside the fall is a shower-bath, which Mr Adams thinks is about three hundred feet high, and must be the highest ever discovered.

Many uncommon ferns and plants as well as

rare birds were met with in this solitary region; amongst the latter was a lovely bird, the scarlet wattletree, also the New Zealand thrush and the saddleback. Kiwis, rowas (the wingless birds), and kakapo (the ground parrot), were fairly plentiful, we are told.

The adventurous company, together with a Mr Mackinnon and a Mr Mitchell, who had themselves just succeeded, after great hardships, in 'blazing' a track right through, returned overland from Sutherland Falls to Lake Te Anau, which is a feat that has now been accomplished for the first time. The scenery, they tell us, all the way is simply magnificent. Thus, a new field is being opened up for those searchers after Nature's glories, which will probably rival in beauty and splendour any other known part of the habitable globe. The promise of a substantial boat to convey tourists across Lake Ada has already been made to the government by the U. S. S. Company, and arrangements have also been made to form a track from the lake to the Falls, and to erect a hut there for the convenience of travellers.

AN ALTERED PURPOSE.

IN FOUR CHAPTERS.—CHAP. IV.

SPARLE's information was only too correct. Rose was ill, was suffering from a virulent type of smallpox, and was even in this short time seriously altered for the worse. Again was the house cleared; again was the trained nurse sent for; and it was plain that each person who saw Rose took an unfavourable view of her case.

She was beginning to wander in her mind; but she never failed to know Rodbury, smiling, after a sad, formal fashion, when he came to her side, and kissing his hand, while she strove to say in broken words how sorry she was to find herself giving so much trouble—rather an incoherent speech, it may be; but she wished him to know it was upon his account, not her own, she was regretful.

Now, this was a terrible fix for Rodbury, to quote his own reflection. He was for the second time ready to start upon his journey, was actually on the eve of departure, and again, as on the previous occasion, a serious hindrance cropped up. He—and the nurse had said as much—'did not like the look' of Rose, and, in fact, had at once made up his mind that she would die; and so, although he had resolved to leave her—had persuaded himself that he was entirely tired of her and her associations—yet how could he desert the girl, his own wife, just as she was dying? When she was gone, there would be no one to see to the poor children; and, besides, there came with an awful force and suddenness upon him the memory of all the devotion she had displayed during his illness. While thinking thus, it also flashed upon him that it might have been his illness which caused hers, another reason for showing a little more consideration for her.

A twinge of something like remorse pained him when he thought of this, and of the train of selfish, unfeeling plotting by which he had parted her. Perhaps from that moment he was conscious of a tenderer feeling for his wife than he had hitherto believed to be possible. Once that

might, he resolved he would not leave London just at once; he would stay to see that his children were properly disposed of; he would see the end of Rose; and—yes, he ought to do that—he would be kind and considerate to her while he was with her. It is possible, we repeat, that from that time Rodbury was less entirely wrapped up in selfishness, and his thoughts held more of tenderness for his wife than they had ever held before.

So day after day he postponed his departure, and day after day he was in the sick-room, full of contagion to all but those who, like himself, were hardened by having passed through the terrible ordeal. He was surprised, after a week or so had elapsed, to find how attentive he had grown; how it seemed no trouble to him to hold the cooling drink to poor Rose's feverish lips, to moisten her burning brow, or to shift her painful position; and it was wonderful how the girl preferred his help to all other, and how, when at the worst, she brightened at the sound of his voice; yet more wonderful than this was the happiness it gave him to be able to render these services.

But it gave more pain than pleasure to hear her, in her scarcely audible accents, thanking him, and saying how she should never, never be able to repay her dear husband for all his kindness—the best and most devoted husband in the world. It was impossible for any one who had nourished and matured such designs as had so lately been Rodbury's, to feel otherwise than guilty—a base guiliness—on hearing language which was more touching than the keenest reproaches.

When she was quiet, too weak to speak, but not too weak to smile as she held his hand while he sat by her side in the darkened room, he would recall the time when she was a bright, healthy girl, and afterwards a happy mother, devoted to her children and to her husband: all her faults and foibles sank to insignificance then, and he began to doubt whether among the fresh scenes he was to seek he would ever be happier. He doubted, too, whether he should ever find another so entirely earnest in her love for him, one who, to use a homely phrase, would go through fire and water for him; and following up this train of thought, he doubted if she would live when she found herself deserted by him. The shock might kill her; but beyond that there was a chance that so fiery a spirit as was hers, with all her love, would lead her to put an end to her own life, if nothing still worse followed.

Sparle had gone back to his district, being unable to spare any more time, so he was not to be feared. To do Rodbury justice, he was hardly likely to hold Sparle or any one else in personal fear.

At last, after much deliberation, more painful than he had expected, and the task of decision to prove, he resolved to wait a day or two longer, as to see her through the crisis, and then he would leave her. He was angry with himself for showing such hesitation, which, indeed, surprised as well as angered him. He did not dream that it was one of the best symptoms his careless, selfish nature had ever shown; nor did he properly estimate the pains which the prospect of leaving his wife and children gave him.

The proposed time elapsed; his wife seemed duly passing through the necessary stages to convalescence; she certainly was growing stronger. Her eyes, it was true, were covered by a bandage; but this, Rodbury knew, or thought he knew, was a very common incident in this terrible disease. Thus the days went on, until once again, for the third time, the eve of his departure had come. 'And I wonder,' he muttered as, after a short saunter in the fresh open air, he came in sight of his house, 'what will happen to upset my plans to-night? There has been the worst of luck about them at present.'

He was conscious, while persuading himself that he was anxious for a final success, that his heart was not so much in the scheme as it had been, and that its completion would cause in him but a moderate exaltation.

He went into the house and into his wife's room. It was now the early twilight of an August evening. Everything, even in that crowded neighbourhood, happened, as he remembered many and many a day afterwards, to be hushed. No vehicles were passing; the vendors of street goods had not come out for the night, while those who plied during the day had ceased their calling; even the children on the street were quiet. How well Rodbury afterwards recalled the unaccustomed peace and hush of that moment!

The room had hitherto been kept darkened, but the blind was now drawn up, and it was light enough; yet Rose still wore a shade over her eyes. The window was open, and the soft balmy air of summer's last days made pleasant even the confined apartment.

Rose turned to her husband as she heard his step, with a smile. He had grown used to see in her smile something very sad; but as the light fell upon her face this evening, there was then an expression which it pained him to see, and the same light showed how terribly she was disfigured by the disease. Hitherto, this unsightliness—such a dreadful calamity for Rose, and her bright pretty face—had been used by her husband in his attempts to steel himself for his task; but now, he could not understand why, although he had never seen the disfigurement so plainly, and though her features had never appeared so seamed and unattractive, he yet felt nothing of the repulsion such a change might have been expected to produce.

He sat down by his wife and spoke to her. She smiled again, but this time her lips quivered strangely; then, as had been her habit of late, she felt for his hand, pressed it in her own, clasped it to her for an instant, then kissed it passionately, and burst into a rain of hysterical tears, striving through her wild sobbing to say something which she could not render intelligible.

Rodbury threw his arm round her, and drawing her head down upon his shoulder, spoke soothingly to her, and asked with a solicitude he had no need to feign, the cause of this outburst—rallying her, too, on the folly of thus giving way, now that she was getting well so fast, and had passed all the dangers of her fearful illness.

'O Frank! my own, my dear husband!' at last exclaimed the girl, 'do not speak like that, or you will kill me! I have never been fit to be your wife, I know, and have always known it; you have borne with me because you were

kind, and I had, perhaps, some common prettiness.—No! do not interrupt me,' she said, as Rodbury began to speak; 'all that is true; but do not argue upon it, for you do not know what is coming. My face, even such as it was, is utterly disfigured—I can feel it is; my mere touch tells me how I must look. I shall only know it thus, for I am now less fit than ever to be your wife. I am blind, Frank! completely and hopelessly blind! I shall never see the light of day again; and worse than that, far, far worse! I shall never more look on the kind face of my dear husband, or see my darling children.—Ah! you draw from me! I knew you would. Why should a sightless, disfigured'—

'Draw from you, Rose!—shrink from my dearest wife!' exclaimed Rodbury. He had involuntarily pushed back his chair at the first shock; but now he clasped the girl in his arms and spoke with an earnestness which had the ring of truth in it. 'I will hope for better than you tell me. With time'—

Poor Rose's tears burst into a fresh flood at this, and she gasped: 'No, no!—never! Dr Berge told me so to-day.'

'Then I will always stay with you, Rose!' cried her husband. His words had a deeper meaning than was dreamt of by their hearer; 'and you shall not miss even your eyes while using mine. I have news also; but I will say only this at present: we shall always be above any need for toil, above all fear of want. You shall have no care for our living or the comfort and well-being of our children, and I need never again go out with John. My circumstances are greatly changed.—Now, dry your tears, and tell me where you should like to live, with the children, and what they shall have to please them.'

He said a great deal more, certainly in a strain which he had not intended to fall into when he entered the house; but without thoroughly knowing it, Frank Rodbury, so to call him still, had been undergoing an improving discipline for some time. He had, until that hour, persuaded himself that he was as determined to carry out his plans of emancipation as ever; that is, he thought he was as selfish as ever, but his churlishness had been greatly undermined, and he was an altered man. Now, the terrible announcement made by his wife; the sight of her seamed and pitted face, which the poor girl knew was disfigured, but which she would never see; the picture which arose constantly in his mind of the children, his children, soothing and clinging to their blind, unsightly, and deserted mother, was too much for him.

He was sincere in what he said; and despite the shocking circumstances which surrounded them, he passed an hour or two by his wife's side more happily than he had passed any interval for months. After a day or two, all fear of contagion being gone, Rose was moved to a healthy northern suburb of London, and her children were brought to see her. These were in robust health. The girl could toddle about freely and talk with a very pretty tongue; while a finer little fellow than the boy never greeted a father's eyes.

Rodbury groaned when he reflected that the poor mother would never again look upon their blooming features or see their pretty curls; and

then, with a still keener pang, he thought: 'What could I have been dreaming of, to plan the leaving such beautiful little creatures as these? children that many a lord would give half his lands to own.'

This was a great change from his previous lines of reflection; but Rodbury was not conscious of any inconsistency; he only knew that his heart now seemed bound to his wife and children, and felt that he could not be happy apart from them.

It need merely be said here that the subsequent report of the doctor and the condition of the patient herself only too strongly confirmed the painful announcement Rose had made. She was blind, hopelessly and wholly blind. Yet, as it so often happens with us in our worst afflictions, there was even with this some alleviating power, for in the increased attention of her husband—the softened tone and tenderness which she so soon recognised—Rose had an under-current of happiness despite of her blindness; and the sad smile which was once familiar to her lips was changed for a brighter if still a subdued one.

As soon as it was safe to do so, Rodbury went to his friend Ashwell and consulted him as to the best plan to be pursued under his altered views. These views considerably astonished Mr Ashwell, who was greatly affected by poor Rose's story, and honestly reproached himself for having given counsel to her husband which involved so much pain to her. He had no doubt now as to the counsel he should give, and this exactly chiming with his friend's own views, it was immediately adopted.

A great deal might be said about the important changes which took place; but as the result must be plainly foreseen, it will not be worth while to postpone the close of our story. Rodbury—he never changed his assumed name—decided upon going to the Far West, to California, indeed; and revealing to some extent his altered position, he asked Mr Sparle to go with him, seeing many ways in which the sound practical sense and business habits of his brother-in-law would be valuable; but Sparle's reply was a decided negative, and—as his last utterance in our chronicle—shall be recorded.

'No, Mr Rodbury,' he said. 'I am much obliged to you, but it won't do. I am not half so surprised about your money as you may expect, for I have always seen you was of a different stamp from ourselves; and if I could have stopped her, Rose should not have married you—that's straight. I can see why you are taking her and the young ones to America; you will not meet any of your friends in California; and I dessay you will manage very well there, and bring up the girl and boy like a lady and gentleman. But you could not make a gentleman of me; and after a time I should be in the way, and be always reminding you, if it was only by my being there, of these times. We should quarrel, and Rose would be miserable. No; we are best apart, and we both feel it.' In his heart, Rodbury was probably pleased at this decision.

Within a fortnight from this interview, he sailed for New York, Rose and the children travelling in such state—with four servants or nurses, these not so much for the journey as for help in their new life—as almost frightened her.

This, of course, she soon got over; and her unfortunate blindness shielded her in her intercourse with the other passengers, who might otherwise have marvelled at the manners of their fellow-voyager.

California was duly reached, and a farm, which they soon learned to call a 'ranche,' purchased. If Sparle's prediction about bringing up the children as ladies and gentlemen was not literally fulfilled, yet all five, of which number his family eventually consisted, were brought up by Rodbury in a befitting manner, and he was as happy as a man can well be.

We close this history by telling how a friend of Mr Ashwell, having been on a sporting tour out West, called upon that gentleman on his return, and in the course of his narrative said: 'While in California, whom do you suppose I came across? Why, Cy Launceston! You remember him? A fellow down in Leicestershire, whom everybody expected would drop into penal servitude some day, even if he escaped the gallows. Well, there he is, quite an influential settler, and a most successful one. He has a great estate, and calls himself Rodbury. I understand his name is now legally this in the States. Anyhow, there he lives with his wife. Poor creature, she is blind; from the smallpox, I believe, and certainly I never saw any one more marked with it. However, in spite of this, she is a bright cheerful little woman, and seems to worship the very ground her husband walks on; at least, so I heard from the neighbours. He has five of the finest children I ever saw—three sons and two daughters. You should see them ride their ponies! It took away my breath—and I am a pretty fair hand across country, I flatter myself—to see some of the ground they went over! There he is, as I tell you, a regular Yankee citizen; and some day, for all I know, he will be in Congress, so high does his character stand. Only think! Cyrus Launceston, of all persons in the world, being presented as an embodiment of the moral, social, and in fact general virtues!'

It was strange, no doubt, to one who, like the speaker, knew some of the antecedents of the person in question; but it is never too late to mend.

HENRY TINSON.

THE MONTH:

SCIENCE AND ARTS.

EVER since the invention of the telephone, there has been a difficulty in using it on wires which are hung near other wires employed for telegraphic purposes, for the reason that the sounds of the working of the instruments in the telegraphic circuit are distinctly audible on the telephone circuit, and make a most distressing rattling. This phenomenon is known as induction; and many electricians have striven to obviate its effects. Among these, some time ago, was Mr Langdon Davies, who, after giving much study to this matter, was led to recognise the so-called induction as a distinct variety of electrical energy, which, instead of being avoided, might be utilized beneficially. After a number of experi-

ments, he constructed an instrument which takes advantage of this force, and which is so closely connected with the phenomena of sound that he calls it the Phonopore. We had recently in London an opportunity of seeing the apparatus in action, and were much impressed with its wonderful capabilities. Attached to an ordinary telegraph line, and by the aid of ordinary transmitting and receiving instruments, phonoporic messages can be sent from both ends of the one wire at the same time, while another message is being sent without any interruption by the telegraph operators. The Phonopore thus becomes a most useful auxiliary to a line which may through some local circumstance be called upon to do more work than it is calculated for. The instrument is readily attached, and will at once triple the capabilities of the circuit.

It has been reported in the *Times* that two large Russian guns have recently been constructed for the ironclad *Sinope*. These weapons have a twelve-inch bore, weigh each fifty tons, and will throw a projectile which weighs nearly half a ton. With a charge of two hundred and seventy pounds of powder, the guns will have a range of thirteen miles; and as the object fired at will at that distance be quite out of sight, the guns must be directed by the aid of a map. We confess that we cannot exactly see how this can be done from the deck of a ship.

A correspondent of the *Scientific American* describes a well of six-inch bore and two hundred feet deep at a town in Colorado which exhibits phenomena that liken it to a barometer. This well is driven through limestone, clay, and gravel, until water is reached in quicksand. Before the occurrence of a storm, this boring emits a blast of pure cool air with a roaring noise, which is loud enough to be heard some distance away; but as the storm passes, the air-current is reversed, and is sucked downwards with an equal force. There are other wells in the vicinity which exhibit the same peculiarity.

A writer in one of the leading New York papers complains bitterly of the amount of destruction which is wrought upon fruit-trees and crops by the English sparrow. These busy little birds have increased to an enormous extent since their importation into the country. The United States Agricultural Department became fully alive to this evil of over-population among the sparrows some time ago, and in one of their Reports recommended the employment of poisoned grain as a means for their destruction, and full directions for preparing it are given. It is believed that the only animal pest which is capable of doing more mischief than the sparrow is the rabbit, which is causing such havoc in Australia. Both depredators were imported from England most probably for mere sentimental reasons.

At the recent International Photographic Exhibition at the Crystal Palace, Sydenham, a number of novelties in the shape of apparatus were exhibited. But the most striking feature of the display was the daily exhibition of lantern photo-

graphs upon an enormous scale, and which helped to demonstrate the wonderful perfection of the photographic image. These lantern pictures measure less than three inches in diameter, and cover, say, eight square inches of surface. They were enlarged at the Exhibition to thirty feet in diameter, representing one hundred square yards of surface. A good photograph submitted to this searching test is actually improved by the magnification, and many unsuspected objects in the picture are brought into view.

We have heard from time to time so many anticipations with regard to the results which will accrue from a cheaper mode of producing the metal aluminium, that we were glad to see that the manufacture of this metal formed the subject of a paper read recently before the Society of Arts by Mr W. Anderson. The particular method of working described in this paper is known as the Deville-Castner process, which has for some time been carried on at Oldbury, near Birmingham. The price of the metal is at present forty shillings per pound; but we must remember that it is so light that a pound of it is the bulk of four pounds of iron. It is brilliantly white, non-corrosive, sonorous, and will retain a high polish. But its chief use is believed to be as an alloy with other metals, upon which it confers new and valuable properties. It gives a marvellous tensile strength to copper, for instance, and thus renders that metal available for purposes for which without its aid it could not possibly be employed.

A very interesting paper was lately read at a meeting of the Society of Chemical Industry by Mr Kingzett, who took for his subject the comparative values of various chemical substances as antiseptics. The experiments described were of such a simple character that they can be easily understood by all. A meat extract was prepared, and after having been divided into various measured portions, each portion was treated with a five per cent solution of the particular chemical the virtue of which it was desired to test. The various solutions employed were too many in number to be mentioned here in detail, but it will be sufficient to say that they consisted of various metallic chlorides, nitrates, and sulphates. The results bear out what has been before indicated by previous experiments—namely, that the chloride of mercury (that is, ordinary corrosive sublimate) is by far the most powerful of any antiseptic known. Unfortunately, it happens to be also one of the most virulent poisons with which the chemist is acquainted, and therefore it may be said to be inapplicable to general use; but at the same time, in the hands of a doctor or other expert it must prove more valuable than any other substance used for antiseptic purposes.

The question of exhaustion of our coal-fields, which assumed such prominence a few years back, has again been raised in a paper on the coal question, which was read at a recent meeting of the Royal Statistical Society by Mr Price Williams. This engineer believes, from calculations which he has made, that the coal of the country will be exhausted in about one hundred years, and dividing the coal-producing counties into districts, he states that the eastern division of South Wales will be coalless in less than fifty years. The coal

of Warwickshire must give way in fifty-three years; in South Wales in seventy-nine years; in Yorkshire in ninety years; Scotland, ninety-two years; Northumberland and Durham, ninety-four; while at the present rate of output, Denbighshire and Flintshire have enough coal to last for two centuries and a half. Mr Price Williams points out that if the various trades dependent upon coal continue their present prosperity the production of that mineral is bound to keep pace with them; and he advises that great efforts should be made to husband our resources in every way, and to put a stop to waste both in working mines and in coal consumption generally. Let us hope that before a coal famine seriously threatens us, other means of raising steam and supplying fuel may come to the front.

A short time ago an account was published of a German apparatus for teaching slaughterers how to strike with the poleaxe so as to obviate the cruel necessity of trying their 'prentice hands on living cattle. A correspondent of the *Times* points out that such an apparatus is unnecessary, if slaughtering were carried on in the humane manner practised at Chicago, and possibly at other places in the States. He tells us that the bullocks to be killed are driven into narrow pens from the stockyard, and that above these pens there stands a man with a repeating rifle; and that as each animal passes below him, he fires a bullet into its brain. Death is instantaneous; and by simple machinery, the carcase is at once lifted out of the way and prepared for market.

Some experiments have lately been made in order to test a new gunpowder which is prepared by chemical means from straw. Its advantages are said to be that it is smokeless, gives no flame, will not heat or foul the barrel of the gun, and that the recoil and report are diminished. The experiments took place at Harrow, and were comparative with similar experiments with ordinary gunpowder. The advantages claimed for this new powder do not seem to be quite realised by these experiments; but there is no doubt that it is a very powerful explosive and that it is flameless and smokeless. Weight for weight it would seem, too, that it is one hundred and fifty per cent. stronger than black gunpowder, and it is conclusively proved that it cannot be exploded by mere concussion. The experiments are full of promise, and there is no doubt that the new powder will be valuable in several applications.

According to the Report by the United States Consul at Patras, an immense quantity of currants find their way from Greece to France, where they are used for making wine. Currants have been imported into France for the use of distillers for the past twelve years, and at first the fruit was simply used to produce alcohol. It was found that the spirit from this source was of very fine quality and nearly as good as that distilled from wine. But the price of the fruit soon became too great to tempt the distillers, and the currants have since been used for wine production, and more especially for the making of cheap wines used by the labouring classes. The process of manufacture appears to be very simple. The fruit is put into large wooden vats holding many tons, with a measured quantity of water, so

a certain temperature, fermentation ensues, the liquid is strained, and after a few days it is ready for use—a ruby-coloured wine of good quality. Currants are also used in the French vineyards to add to the fresh grapes, and the whole are allowed to ferment together. The wine obtained is of fine quality, and, curiously enough, is far better than if the currant wine is added to the grape wine after separate manufacture.

Another Report from the United States consul at Marseilles points out that the olive-oil trade of Southern France is being terribly injured by the wholesale adulteration of that article of commerce. For this purpose the oils of various seeds are used, especially cotton-seed oil, which is cheap, and which, moreover, has a palatable flavour. The admixture of this oil with true olive oil has been up to this time very difficult of detection. A way, however, has been discovered of detecting the adulterator in his nefarious work. This method depends upon the principle that oils when mixed with certain acids assume different shades of colour. Pure olive oil will when so located assume a certain tint of yellow, which can always be compared with a standard colour; and it becomes very much darker if it be adulterated, the colour deepening according to the amount of adulteration. To show the extent to which olive oil is now adulterated it is stated that more than two million gallons of cotton-seed oil come from the United States to Marseilles annually, and it is estimated that half of it is used for sophisticating olive oil. It is curious to find that a very large proportion of the oil so made finds its way back to the United States, notwithstanding a duty of thirty per cent. upon its importation.

It is pretty well known that many of our Railway Companies, in order to obviate any chance of competition by means of the canals which intercept the country, and which before the establishment of iron roads did such a thriving trade, have bought up those water-ways, so as to render them idle. In order to again throw these canals open, a Bill has been introduced into parliament which proposes to confer upon the local authorities power to acquire any canal when it is desirable in the public interest that a Railway Company should cease to have interest in it. The Company in such a case would be compelled to part with the canal at its actual value without any increase for compulsory sale.

A new method of studying the structure of timber has been brought before one of the American Scientific Societies. The system recommended is to employ frames of cardboard, each holding three samples of the wood to be studied or examined. This wood being in the form of a section as thin as it can possibly be cut, the three sections would exhibit the wood under three different aspects, one being transverse across the grain, and the other two cut in the direction best adapted to a study of the structure of the material. The system seems to us to be merely a variation of the common method of examining woods in section with the more powerful eye provided by the microscope.

A novel form of canal has been designed and patented by Mr Arthur Pickard of Leeds, and a working model of it has lately been exhibited in London. The object of the inventor is to do away with locks or any form of baulage by the rather

round-about process of putting the water in motion itself. This is brought about by dividing the canal into two by a central partition, and putting a screw propeller, worked by steam-power, at one end of the water-way. This screw will force the current in one direction, and cause it to return by the separated half of the canal. We fear this is one of those schemes which work very well on a small scale and in a model, but which are hardly practicable when applied to real work.

The recent salutary alterations in our patent laws have had the effect of encouraging inventors; and many useful articles and contrivances are now brought forward which in former days would perhaps never have been invented, or at any rate not made public. Among recent small things of this character we may note a Patent Drying Rack for household purposes, which has been invented by Mr T. G. Daw of Cheapside. This is essentially a domestic contrivance, and its homely duty is to dry plates, dishes, and glasses, and other utensils without wiping them. The rack consists of an upright ladder-like arrangement, fitted with shelves, having between them various-sized spaces. The top shelves have pegs upon which tumblers and other glasses, jugs, &c., can be placed in an inverted position after having been rinsed. The lower shelves are designed for plates and dishes. The contrivance occupies very small space, for over one hundred pieces of crockery and glass can be dried on a rack which takes up only one square foot of ground and is about five feet high. The drainage from these various articles is caught and carried to a reservoir, so that one article cannot drip into another below it.

Another appliance, also of a domestic character, is of more importance, because it aims not only in fulfilling an ordinary domestic want, but in obviating loss of life by fire. This is an improved Fire-guard, patented by G. W. Page of King's Lynn. It consists of a curtain of flexible wire-netting which rolls like a blind in front of the fireplace, and which when not in use rolls up in a space provided for it underneath the mantelpiece and is quite out of sight. The utility of this invention for protecting ladies and children from those lamentable accidents which have so often occurred is obvious, and the invention is likely to meet with very wide adoption by those who are careful to take advantage of such precautions against accidents.

We have recently had an opportunity of seeing in action a new electrical tramway, the first of its kind which has been established in Europe. This interesting installation is at Northfleet, near London, and it promises to be the pioneer of a system which will replace the use of horses for tramway-work. The line is about a mile in length. The cars go at good speed and up somewhat steep gradients with the greatest ease. The method employed is that known as the Electrical Series System, and will admit of several cars running together on one line at the same time without any chance of collision. The current is generated by a dynamo-machine at one end of the line, and is carried beneath the road to certain contact-pieces which lie in a conduit below one of the rails. Rubbing against these contacts is a kind of conducting bar, which projects from the vehicle through a communicating slot by the side

of the rail. By this means the current is conveyed to a dynamo carried beneath the car, which is geared to the wheels. The inauguration of the new system has attracted much attention.

GOOD AND BAD LUCK.

COINCIDENCES.

NOTHING is commoner than to hear talk of good luck and bad; lucky people and unlucky; lucky days and unlucky, with special reference to Friday, which seems to have got a terribly bad name indeed. Ninety-nine sailors out of a hundred count it unlucky to set sail on that day; and some, even captains who have weathered many a storm, refuse to do so. I was talking the other day to an old 'salt' at Brighton about this very question, and I did my best to get out of him what his views were, and what reason there could be for so strong and widespread a belief, or, as some call it, superstition.

'You,' said I, 'have been afloat pretty often; to my knowledge'—

'Forty years, next March, in all weathers,' interrupted the captain.

'Well, then, what's your own real opinion about Friday?'

'I can't say I like it at all myself,' he answered. 'I never knowed things turn out right that were launched on a Friday; though I've had to face them in my time; for it isn't every skipper or owner that will listen when the men growl about going to sea on the day after Thursday. "It's all a confounded pack o' nonsense," they say. All the same, it holds good among sailors, and will hold, too.—Ask any of 'em alongshore here what they think. They will tell you that the worst gale last November began on a Friday, when the life-boat was all but capsized—that the end of the new pier was washed away on a Friday—that Friday's catch of fish is always about the worst of the lot; and if the nets break away of a night with mackerel, it's sure to be coming home on a Friday.'

'Well,' said I, 'as for mere luck at sea, do you know that a year or two ago one of our great shipbuilders determined to show that you sailors were all in the wrong about this terrible day? He built a brig and named her *Friday*, laid down her lines on a Friday, finished her that day seven weeks, launched her a week later; her captain's name was "Friday," with thirteen hands aboard—the worst of all unlucky numbers—and on a Friday she set sail for her first trip!—That's a pretty good proof of what Friday's luck is!—Did you ever hear of that brig?'

'Well, to tell you the truth, sir, I have heard of that yarn before; but you've left out one thing, now. Did you ever hear what become of that there brig?'

'No,' said I; 'I don't know that; but of course'—

'No, no, sir; you don't know, and nobody else don't know. They said she would come home on a Friday; but she didn't come; and Jack Rogers, the old coastguard at Hove—as I heard tell the story—he swears she was never heard of again, captain or crew. And as for thirteen hands aboard, why, that one lubber over the baker's dozen would have been a regular Jonah; and a

Jonah's time he would have had of it, too, till the fishes got hold of him.—No offence, sir, I hope, at my speaking out so strong; but there's no mistake about Friday.—Good-night, sir.'

Yet, in spite of my old sailor's belief, some great and notable and good things have taken place on a Friday, which would have amazed him not a little if I had then seized the chance of telling them. For example: On Friday, 3d August 1492, Christopher Columbus set sail on his great voyage of discovery. On Friday, 12th October 1492, he first discovered land. On Friday, 4th January 1493, he sailed on his return voyage for Spain; and on Friday, 15th March 1493, he arrived in safety at Palos. Many other historic events of significance and of good-luck have occurred on Friday.

Yet Friday is regarded by many as a day of ill-luck; but for making it specially unlucky you must upset the salt. 'The falling of salt,' says my Lord Bacon, 'is an authentic presagement of ill-fortune, nor can every temper contain it. Yet is it only an omen.' Nor is the origin of this belief far to seek. From the earliest times, salt, itself incorruptible, has always been regarded as more or less sacred; hence sprang its having a place in all rites of sacrifice and oblation. Thus it became a symbol of friendship, and, before any other service, was offered to the guest, in token of good-will on the part of the host. If, during this offering, it was accidentally upset, and, still worse, if intentionally on either side, evil in some shape was deemed a certain issue.

To turn now to such minor matters as mere luck in every-day life is to make a mighty step down to trifles. If a coin be spun into the air, it is obvious that the chances whether it come down head or tail uppermost must be equal. Yet, in spite of this, one special woman in a village shall be said to have great luck in the 'making' of butter, or one particular gardener to be most lucky in the grafting of roses or melons; that is to say, that Lucky Betty or Lucky Tom succeeds where scores of others would fail. Whereas, the truth is that success in either case is simply owing to greater skill or greater care in handling the churn or the pruning-knife, which the other bumpkins fail to exert. If not so, all comes back to the doctrine of chances; and any one given Hodge or Dolly may be as lucky as Tom or Betty.

Oh! say some village wiseacres, 'but fortune favours fools!' Yes, now and then it would seem so; perhaps because a fool trusts all to fortune, and sometimes succeeds where wiser men fail—mainly through ignorance of danger or obstacle—and so goes to work coolly in hazardous things; just as a blind man, having once learned the road, will walk calmly along the very edge of a cliff, where the owner of a pair of sharp eyes would be apt to grow dizzy and stumble. If a fool who leaves his doors unlocked escapes robbery, he is often called fortunate or lucky; whereas the prudent man who prevents the burglar's visit by wise precautions, enjoys no such credit, but has to be content with being more frequently lucky than the fool, because he puts himself more in the way of good fortune. Now and then, one meets with some poor forlorn wretch with whom every thing seems to go wrong, and who, always in trouble, soon gets the nickname of 'Unlucky' Dick.

But, of far more curious and true interest than any matters of mere luck and chance, good fortune, and bad, are what, for want of a better name, we call Coincidences, into which there would seem to enter a new factor, not so easily defined. By way of illustration, I give a few instances which have fallen under my own personal observation. Thus: I meet with a stray word, say 'Toboggan,' just now in common use among us, and, as a matter of mere curiosity, wish to know its derivation. I consult every dictionary I can lay hands on, but in not one of them does the word appear. I ask right and left among the gay young people who are just now gone mad about the delights of Tobogganing; but not a soul can help me. I question two charming girl graduates fresh from the Honour list at Cambridge, one of them specially great in etymology, whom I beg to visit the British Museum in search of that odd Canadian word. I might as well have asked the man in the moon; and I give up 'Toboggan' as a hopeless mystery; and in a month's time have forgotten the whole affair. But one day I walk into the Free Library at the neighbouring county town, and take up a number of a local magazine, open it at random, and as the motto to an article on 'Acme Skates,' I see these words: 'Toboggan, from *odabagan*, an Indian word for sled.'

Again, I have a brother whom I very seldom see, and who seldom leaves his headquarters, some three hundred miles away. I walk four miles through the woods to a small roadside station, on my way to Waterloo. The train is at the platform, but waits for the arrival of an excursion train from Bristol. In five minutes it comes rattling down the branch line: out pour a crowd of passengers to change carriages for London; and the first person I see hurrying along is an old friend whom I believed to be at Cannes. We journeyed up together to Waterloo, and almost the first thing she said to me was: 'How is your brother Jack? Do you ever see him?'

'Never,' I replied. 'He may be dead and buried, for all I know. I rarely go to London, and he still more rarely visits the great city; so that there is no chance of catching him during one of his flying visits.'

'I am sorry for that,' said Miranda. 'It's two years since I last saw him at your house, when you lived in town.'

When we got to Waterloo, there was some debate as to whether we should travel any farther together; but the end of it was that, as Miranda was bound for Regent Street, and I for Holborn, we would walk to Charing Cross by the suspension bridge. As we went down the steps at the other end of the bridge, a man with a carpet bag came rushing up to meet us, two steps at a time, and that man was my brother Jack!—amazed, and glad to see us, and we to see him. Five minutes later, we should have missed him.

'It's like a regular "House that Jack built,"' said I. 'If I hadn't walked to that special train at Woodend, I should not have met Miranda. Not meeting her, I should have taken a "bus" at Waterloo, and never gone over Hungerford Bridge.'

'If it had rained,' said she, 'we should not have wanted to walk together.'

'And if,' added Jack, 'I had not lost my way in coming from Euston, I should have been at my

lawyer's long before this.—And that reminds me, old fellow, it's exactly two years since I saw you. I came up on this very 15th of November in 1864, and slept at your house; and now we meet again on the 15th in this odd fashion.'

So, after a good talk, for I had completely forgotten the date of our last meeting, we parted.

Some ten or twelve years ago, I was in the habit of writing occasional articles for an old-fashioned newspaper called the *Daily Tearer*. While on my way to the office one fine summer morning, I chanced to pass the well-known book-stall of my old acquaintance, Larkins, and strolled into the shop for a chat. Mr Larkins was busy revising a catalogue; and on a table in front of him, half covered with books, lay a newspaper.

'Good-morning, sir,' said the bookseller; 'I'll be with you in two minutes.'

'No hurry,' replied I. 'You take in the *Tearer*, I see; I will have a look at it.'

Before I had read half a column, he joined me. 'If,' said he, 'you had come in three minutes earlier, you would have seen the man who wrote that curious article about rats.'

'Which curious article?' I inquired.

'Why, that very one now in your hand.'

'That is very odd,' said I. 'Who is the man, and how do you know that he wrote the paper on rats?'

'Well, sir,' replied Larkins, 'the gentleman is a stranger to me. But he came into the shop, bought a French grammar, and was just going out again, when he saw the *Tearer* lying open there. "Ah," says he, "do you take in that old gossip of a paper?"—"Yes; and a very good old paper it is too."—"Did you notice that little article on Rats?"—"I have just read it," I replied; "and a very good article it is."—"Well," says the stranger, "I am much obliged to you for the compliment; I don't often get praised; but, as the author of 'Rats,' I am bound to offer you my best thanks, and wish you a very good-morning." And with that, away he went. I never set eyes on him before, and I don't suppose that I ever shall do so again.'

'If you should ever chance to do so, Mr Larkins, tell him, with my compliments, that he went away with a lie in his mouth. He had no more to do with the "Rat" paper than Adam. I corrected the proof of it only two days ago, and the manuscript is now on my study table.'

After that, we had a long chat about coincidences in general, which I held to be common enough, though the one which had just occurred was singularly strange.

'I don't know much about their being common,' said Mr Larkins; 'but I can tell you of a far more curious instance. One day, a stranger came in and asked for a copy of Blair's *Sermons*, a well-known book, but quite out of fashion now. He looked at the only copy I had, bought it, and paid for it; and was about to go, when he suddenly stopped and said: "If you have no objection, I will leave the book with you until I happen to be in town again."—"By all means," said I; "as long as you please."

'Well, I kept that old Blair stowed away; but months passed, and I saw nothing of him. Then, as you know, it so fell out that I gave up my old premises at No. 190, and took these, and then

three months more passed. But not a sign of my friend the purchaser of Blair, whom, indeed, I had almost forgotten. At last, one evening, in came an old lady and asked for a copy of Blair's *Sermons*. "I have only one copy," said I, "and I fear that I cannot part with that one, for it was bought and paid for six months ago, though the owner has never called for it." But the old lady was very urgent with me; and so at last I gave way. The price was one shilling. My new customer handed me half a sovereign to pay for it, and I turned round to get change, when some one else suddenly entered, and I heard a sharp voice say: "A pretty dance you have led me, Mr Larkins. Here have I been hunting up and down the street for half an hour in search of my old friend Blair. I could have sworn that I bought it at No. 190.—I hope that the book is all safe."—"You are quite right about 190; and there is your copy of Blair tied up in paper as you left it six months ago.—This lady had just persuaded me to let her have it, and I was just turning to give her change, when in you walked and claimed your property."—"And I mean to have it too," said the old man in rather a peppery tone.—Of course, he *did* have it; and the lady had to wait for another copy.

'Well, Mr Larkins,' said I, 'that is even more curious than the adventure of the paper on rats.—Did you ever see either of your customers again?'

'Never, to this day.—But I haven't done with *Sermons* yet, if you care to hear another coincidence. A country schoolmaster somewhere down in Devonshire wrote to me for a volume of *Sermons to Boys*. I told him that it was out of print, but that a second-hand copy might no doubt be had. To this he agreed; and, of a friend lower down Booksellers' Row, I got him a copy, *uncut*, with his own handwriting on the fly-leaf! given by the very same schoolmaster to a former pupil, who had carried it off to London, and showed how highly he valued sermons by selling his prize at a bookstall.'

One more example and I have done. Miss M—— of Bristol was a great writer of letters. One morning she entrusted a certain special letter to her brother C——, just starting for the city. He, *en route*, meeting an elder brother G——, and wishing to get rid of the letter, entrusted it to him. G——, who possessed a memory as treacherous as a sieve, put it into an inner pocket of a greatcoat for special safety, and straightway utterly forgot its very existence. The writer of the letter, supposing it to have been posted, also forgot the whole affair. But many long months after, while repairing her brother's greatcoat, she suddenly came upon that inner pocket, dived into it, and there found her own letter, duly addressed and stamped. The discovery occurred on Christmas Day 1887; and when opened, the letter was found to be dated Christmas 1886. There it had lain *perdu* for a twelvemonth to the very day—though no doubt the coat had been used hundreds of times by its eccentric owner, without a thought of his past negligence.

Of course, it may be said of all such occurrences as this latter example of Coincidence, that they are but trifles and scarcely worthy of notice; nothing turns upon them, nothing ever happens

in consequence of their having come to pass. But for all that, it may be said, in reply, that for the most part life is made up of trifles, big and little, and that on some of these trifles events of singular interest or importance often chance to turn. Many a grievous misfortune, or splendid good fortune, has depended on the loss, or delivery, or discovery of a letter. Many a sudden and unexpected meeting of long-parted friends has caused joy or sorrow to a whole lifetime. Many a strange chapter of adventure has issued from the sojourn of an odd volume of sermons at a bookstall. Anyhow, the whole subject seems to be one not to be flung aside as unworthy of consideration.

Whether any other factor besides that of chance enters into the birth of Coincidences, and if so, what that factor may be, is a question which must be left to our readers' own consideration. Want of space forbids me to pursue it; and I must be content if I set them thinking on some of the coincidences which have occurred in their own personal experience.

My friend Boxer, to whom I once told one or two of the above coincidences, calmly shook his head, and then said: 'Well, I will add one case to your list, as curious as any you have mentioned. Last March I had a set of plans to finish for the office. I counted them up, and made just thirty-one of them. Now, it so happens that my birthday was on the 31st, and on that day, as I thought, I finished the last of them. While smoking my final pipe (not the thirty-first) that evening after my work was done, I said to myself: "How oddly things do happen! Here am I, thirty-one years old to-day, with thirty-one plans on the 31st day of the month." Then I looked in my daybook to see when I began them, and lo! it was on January the 31st. But it wasn't; very nearly, though—February the 1st. Before tying the plans up, I counted them over again; this time there were only thirty—not one more could I make of them. Another glance at my daybook told me, too, that *yesterday* was my birthday! and that to-day was April the 1st, when wise men are sometimes made April fools.—That,' said Boxer spitefully, 'was very near being a remarkable Coincidence.'

OCCASIONAL NOTES.

THE CHIGNECTO SHIP RAILWAY.*

THE inauguration of the Chignecto Marine Transport Railway Company, to give the undertaking its full title, is deserving of some notice, for it marks an epoch in engineering enterprise, as the first attempt to carry into actual practice a system of transporting vessels of large tonnage across isthmuses, which, though frequently mooted, discussed, and strongly advocated, has never as yet been further developed than favourable reports and carefully elaborated illustrations and designs. The fact, therefore, that work has actually been commenced on the first ship railway, and that ere long the transport of vessels between Tidnish and Amherst across the narrow isthmus that connects Nova Scotia with the mainland will be an accomplished fact, cannot fail to arouse the interest not merely of the members of the engineering profession but of the public itself.

Turning now to the theory of the scheme itself, we may briefly sum up its salient features for our readers. A ship railway is designed to answer all the purposes of a canal—namely, enabling vessels to pass from one sea to another without the expense of cutting a navigable channel, and avoiding the necessity of a large number of locks—a most expensive item in cost, when the variation of the times of the tides on either side of the isthmus presents the difficult problem of great differences of level in the two seas to be connected.

The essential arrangements for the carrying out of a ship railway will be readily understood. Docks are constructed at each terminus to accommodate the vessels; in this case, sufficient to hold at the same time six vessels of a thousand tons each with full cargo; powerful hydraulic lifts are provided for raising and lowering the vessels to the railway across the isthmus, seventeen miles in length. The vessels are carried on cradles running on four lines of rails, and are drawn by two locomotive engines working side by side.

Turning, now, to the geographical question in the case in point: the advantages of the new route will be readily perceived by glancing at the map of Canada. Vessels leaving the ports in the River and the Gulf of St Lawrence for the Bay of Fundy and the harbours along the eastern seaboard of the United States are at present compelled to pass round the northern point of Nova Scotia. By availing themselves of the new ship railway, a saving in distance of from five to seven hundred miles will be effected, in addition to escaping the risks of navigation outside Nova Scotia, and the enhanced marine insurance premiums charged for a notoriously bad piece of coasting. Moreover, vessels of lighter build can be employed in the service, being no longer required to face the open Atlantic Ocean. The new mode of transport will also be available when the Straits of Canso, which are frequented by smaller craft, are blocked with ice.

The Dominion of Canada has subsidised the undertaking; whilst the Municipal Council of the county of Cumberland, Nova Scotia, through which the line passes, has made a free grant of all land required. The engineers of the undertaking are Sir John Fowler, K.C.M.G., and Mr B. Baker, well known as the designers of the celebrated Forth Bridge, now rapidly approaching a successful completion.

CONCERNING A MARLBOROUGH RELIC AND 'THE CHEVELEY NOVELS.'

The Sunderland Sale is still within the memory of many of our readers. One of the lots sold on November 9, 1882, was the 'Presentation Copy of the Congratulatory Verses recited at the Sheldonian Theatre, Oxford (January 1, 1705), on the occasion of the victory of Blenheim, and given to the great Duke of Marlborough,' recounting the battle, and also the capture of Tallard, the taking of Gibraltar and Landau, &c. That a volume 'so closely associated with the origin of his wealth and honours should be sold, argues a cynical indifference to the ordinary sentiments of man-
which will surprise even a pessimist,' as a

correspondent of the *Pall Mall Gazette* pointed out in that journal on May 3, 1883; and the then Marquis of Blandford endeavoured to recover the treasure from the purchaser; but he 'would not part.' This historical memento has now, however, found once more a resting-place in the family; for it has come into the possession of Mr H. G. CHURCHILL, who brought out and edited *The Cheveley Novels*, and who has been residing in Spain for some years.

IN AN OLD CHURCHYARD.

In one of England's sweetest spots,
A little old gray church I found;
Around it lies—dear restful ground—
God's garden with its sacred plots.

With myriad arms the ivy holds
Its time-worn walls in close embrace:
So Memory sometimes keeps a face
Half veiled in tender misty folds.

With sleepy twitter and with song
The tower, bird haunted, is alive;
In leafy seas they dip and dive,
Those tiny warblers all day long.

Like sentinels grown hoar with age,
The crumbling headstones guard the graves
That softly swell—green voiceless waves,
That will not break though tempests rage.

'Concerning them that are asleep'
In this sweet hamlet of the dawl,
In broken sentences I read
The record those old tablets keep;

Each told its tale, for hath not Grief
A voice whose echoes never die?
Adown the ages, Rachel's cry
Still rings o'er some God-garnced sheaf.

Mine eyes, ne'er prodigal of tears,
Did fill with such as seemed to rise
And drown the glory of the skies,
O'er those who'd slept two hundred years.

M. HEDDERWICK BROWNE.

* * TO CONTRIBUTORS.

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
 - 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
 - 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
 - 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.
- If the above rules are complied with, the Editor will do his best to ensure the safe return of ineligible papers.

THE OLD HAILEYBURY COLLEGE.

A NEW Haileybury College, like a hermit crab, has taken possession of the shell of the old Haileybury. But the existence of new Haileybury numbers only thirty years. It was in 1858 that the old Haileybury College closed its gates, and ceased to send forth to India a specially trained band of young men to carry on the civil administration of the Indian empire. It is of the old Haileybury College that we now write. Almost all those who passed through Haileybury into the Indian Civil Service entertained an affectionate regard for their *alma mater*. From year to year a commemorative dinner is held in London by the retired Indian Civil servants, to which they invite the surviving professors of the College, as a pleasant renewal of the friendly feelings of old times.

It is unnecessary to ransack ancient records to show how the Chairman and Directors of the East India Company were prompt to recognise the expediency of establishing a special training college for the young men—then called writers—whom they sent out to carry on the civil departments of government in India. Originally there was an institution at Hertford where handwriting, double entry, and book-keeping formed part of the curriculum of instruction. But when the Directors had built their own palatial College at Haileybury, they determined that the students should receive a more liberal education, in classical and modern literature, in mathematics, in political economy and law, and in the several oriental languages, which would be of practical use in India.

Haileybury College stands on the southern slope of a low range of hills, about two miles from Hertford. It is about the same distance from the little towns of Ware and Hemdesdon. It was almost surrounded by ancient woods, in which the nightingales were numerous. The soil was a cold clay, and there was but a scant supply of water. The site was isolated. Probably the directors of the East India Company thought it expedient to keep their young men as far as pos-

sible removed from the temptations of any large town.

The College was in the form of a large quadrangle, covering an area of about one hundred and fifty yards square. The south or ornamental front looked upon a broad raised terrace. The south front contained the Chapel, Library, and Dining-hall. The main-entrance gate and porter's lodge faced to the west; and on either side of them were the principal lecture-rooms, supplemented by a reading-room and billiard-room. The north and east buildings were devoted chiefly to the four sets of rooms in which the students lived. The Principal and several of the professors had their houses in the quadrangle, so as partly to divide the students' quarters. The College kitchen and buttery were in the south-east angle, convenient to the College Hall. The Hall served also periodically as the examination chamber.

The educational staff of the College had been carefully chosen. In 1842 Dr Le Bas, a sound scholar and an eloquent preacher, was Principal. Dr Jeremie, the Dean and classical lecturer, was charged with maintaining the discipline of the College, a duty for which his kindly and tender nature seriously unfitted him. Canon Heaviside, the chief mathematical lecturer, was always popular with the students, officially and socially. The law lecturer was Empon, the friend and son-in-law of Lord Jeffrey. The Rev. Richard Jones, the author of the well-known book on *Rent*, was Professor of Political Economy and History. Captain Schaleh, a retired Indian officer, taught Hindustani. The Mirza, Mahomed Ibraheem, a Persian gentleman, was Professor of Arabic and Persian; whilst Mr Johnson, a self-taught oriental scholar, equally familiar with Persian and Sanskrit, had the pleasure of introducing us to the mysteries of the Sanskrit tongue.

The students were about eighty in number. Every half-year the senior term of twenty men passed out into the Indian public service, and twenty new students were admitted into the College. We all wore caps and gowns, and were divided into four terms, or classes, with separate

lectures for each class. The young men were nominated by the Directors of the East India Company, chiefly from the upper middle class of society. Some of the students had been at Oxford or Cambridge. The public schools, such as Eton, Rugby, Winchester, and Charterhouse, sent their quota. But the majority of the young men passed the entrance examination into the College by undergoing a special preparation at certain professional crammers.

A day's life at Haileybury began with chapel at eight o'clock; and we were expected to get our breakfast finished in time for the first lecture at nine o'clock. During the first term this lecture was in classics. The next lecture was at ten o'clock in Sanskrit; and the third at eleven o'clock in law. The subjects varied according to the days of the week. Our public lectures were all over at twelve o'clock, and then we were left to our own devices. Some very hard-working men would read in their rooms the whole day, merely taking a short constitutional walk. Others went off to Hertford or Ware to spend the day. There were five courts, and a cricket-field attached to the College, and many men found ample amusement there. Our boating was obtained under difficulties, for the river Lee was two miles off. There were always carts and other vehicles to be hired near College; and the landlord of the *Rye House Inn*, where our boats were kept, set up an old stagecoach, which used to wait at the College gate at twelve o'clock for the special conveyance of the members of the Boat Club. When the boating-men were at the *Rye House* they usually remained to dine there; but if they wished to return for dinner in the College Hall, they had to be back by six o'clock.

A substantial dinner was provided in Hall. The students sat at separate tables according to their terms. The Principal and professors of the College dined at high table in the Hall at the same time as the students. After dinner we adjourned to our rooms for wine-parties, as we were allowed to draw a small quantity of wine—a bottle a week—from the College cellars—which was of course supplemented from our own contraband private stores. There was evening chapel, by way of a roll-call, at eight p.m., and then we were expected to devote ourselves to private study. In the set to which I belonged our study took the form of loo, and we played loo almost every evening, with intervals for refreshment, till twelve o'clock, when a College watchman, or the marshal, warned us that we must retire, all lights being then put out.

The discipline of the College was not over-strict; but there were fixed hours for 'gates'; and if any student returned to College after gates, the time at which he passed through the porter's lodge was reported to the Dean. This was a severe penalty, and led to the use of certain unauthorised paths into College; and although all the windows on the ground-floor rooms were

secured with strong iron bars, some of us knew where a removable bar was to be found in case of necessity. Even the high iron terrace gates, surmounted by *chevaux-de-frise*, were occasionally scaled, when an accomplice inside the College could provide a blanket or a saddle to cover the revolving spikes.

The relations between the students and the professors were generally good. Some of the lectures were not very difficult, and the professors did their best to make even the difficult subjects as pleasant as might be. Some men had a great antipathy to the oriental languages, and could not induce themselves to learn them. There was one young man of my term, to whom I will give the name of Burton, who really gave himself more trouble about not learning Sanskrit and Persian than if he had quietly settled down to the work. He was a lad of good ability, and had a fair reputation as a classical scholar. But he conceived an aversion to the Sanskrit language; and the appeals of the amiable professor were addressed to him in vain. But whilst Burton took his peculiar mode of not learning Sanskrit, he was equally perverse in his hatred of the study of Persian.

The Persian professor, the Mirza Mahomed Ibraheem, soon took a dislike to Burton, whose conduct at lecture was, to say the least, frivolous; and a hearty pluck was anticipated for Burton at the final examination. But Burton disappointed the professor. With the help of a friend, he learnt two out of the four dialogues by heart, and could repeat them fluently, to the astonishment of those who did not understand his character. When the examiner, Professor Wilson, arrived from London, and the term was arranged before him, he naturally began with the student at the head of the term, who performed fluently. Burton meanwhile began to attract attention by making a noise and laughing, and the Mirza at once fell into the trap.—'Ah! Mr Wilson,' said he, 'perhaps you will next take Mr Burton and put him out of his misery, as he wants to be plucked.' So Professor Wilson called up Burton, who, professing to read from his book, repeated and translated a part of the dialogue which he had learnt by heart. 'Thank you, sir,' said Professor Wilson; 'you have done very well; and Mirza ought not to have tried to prejudice me against you.' The Mirza's indignation may be imagined.

We also had to learn the Hindustani language, of which Captain Schaleh was the professor. To the best of my recollection it presented no great difficulties; but in my term we paid little attention to it, and only learnt enough to get a pass. The fact was that in our term there was one young man who had been born in India, where he had acquired Hindustani as a child, and his parents had carefully kept up his knowledge of both the spoken and written language. Poor Charles Manson! He was very good-looking and a great favourite, and no one grudged him

his prizes. He was one of the earliest victims of the Indian Mutiny, and his brilliant career was thus sadly closed. At Haileybury, he and the professor did most of the lecture between them. On one occasion, the professor desired the class to learn some extra chapters of Hindustani, beyond the usual college work, when the class unanimously refused. This was the beginning of a great College row, which lasted for several days; and though the students had very little cause to be proud of their grave misconduct, it can hardly be said that the College authorities showed sufficient wisdom or discretion in dealing with the affair.

When Captain Schelch had lodged his complaint with the Principal, the latter took counsel with his other colleagues, and very soon a messenger arrived summoning some of the heads of the offending term to appear before the Principal. When these young men appeared, they were informed of the charge against them and requested to apologise. They advisedly pleaded that they had no authority from the rest of their fellows to offer an apology, and they suggested that all the members of the term should be summoned to the presence-chamber. To this the authorities weakly consented, and it was settled that the whole term should appear before the Principal the next day at twelve. This being done, the kindly old gentleman was proceeding to lecture them, when he was interrupted by a request that the Professor of Hindustani should be confronted with them. When Captain Schelch arrived, one of the leading students abruptly asked him to state what information he had given to the Principal. 'I told him,' said Captain Schelch, 'that you declined to continue the lecture, and left the room tumultuously.'—'Did you not tell us to leave the room?' asked the student.—'No, sir,' said Captain Schelch; but then recollecting himself, he said: 'Perhaps I may have told you to leave the room, but of course I did not mean it.'—'There, sir!' shouted the student to the Principal, who was slightly deaf; 'Captain Schelch admits that he told us to leave the room; and we think that he is bound to apologise to us, rather than that we should apologise to him.' Of course Captain Schelch scorned the idea of apologising; and the Principal, who was not prepared for this turn of affairs, determined to consult his colleagues, and he requested us to retire.

Unluckily, quite independent of this affair, it chanced that a very popular student had been sentenced to rustication that very day. His offences were merely the offences of idleness, such as non-attendance at chapel and lectures, and similar breaches of discipline. When a student was rusticated, it was the custom of the College authorities to send him off in a yellow postchaise and pair in charge of the College marshal. The other students usually assembled at the porter's lodge to bid adieu to their departing brother. On this occasion, when the postchaise came to the door, the postboy was surprised to find his traces unhitched and the postchaise going off towards the ditch; but the College servants came to the rescue, and our friend B— was presently driven off up the avenue amongst the cheers of his fellow-students. The Dean came out, and in his usual gentle and pathetic manner, begged the students to go to

their rooms; and peace was temporarily restored. But the wrath of the young men was now turned upon the unfortunate Dean, who had been the author of the sentence of rustication on their late comrade, and a riot and breaking of windows followed.

It is hardly possible after so many years to remember all the details of the row. Lectures were suspended; and from time to time students were summoned before the dons, sometimes singly, sometimes in twos and threes, and they were questioned with a view to make them confess who were the principal delinquents. Some of the favourite professors, such as Heavyside and Jones, sent for several of us to their private houses and talked most kindly to us about our folly. They knew pretty well who the leaders in the row or rebellion were, and they were chiefly men of the term to which I belonged. Several of the worst among us were invited to go to the bursar's office, and there we met with a most unexpected offer of terms. He said that he was authorised to advance five pounds (this money was duly charged in our College bills, to the disgust of certain parents and guardians) to each of us, if we would agree to withdraw ourselves from the College until we had had time for reflection and repentance. We cheerfully accepted the offer, and six or seven of us adjourned to Long's Hotel in Bond Street, where we lived a gay and idle life as long as our ready-money lasted. Then, as the dons had expected, we sued for permission to return to College, and promised to misbehave no more if our conduct was condoned; and we faithfully kept our promise.

It is more pleasant to turn to the recollection of some of those days known as the 'Dis' days,' when the Chairman of the East India Company and a number of the Directors came down to Haileybury to hear the results of the half-yearly examination, and to present the prizes to the students who had won them. Certainly the prizes were very liberal. For the men of the term which was completing its College career there were gold medals for every subject; and there were handsome book prizes for the other terms. It sometimes happened that the young man at the head of his term was so superior to his fellows that he would carry off almost every prize, and he could hardly stagger away under his load of prize books. In the term to which I belonged we had no very severe competition for the prizes, but they were settled by a sort of understanding amongst ourselves. Thus, one of us took the Persian and Hindustani medals without a rival; another man appropriated the Classical and Sanskrit medals; a third man was *facile princeps* in Mathematics and Law. History was considered an open subject, and as it gave little trouble, no one monopolised it. It was the custom for the winning students to read out their prize exercises in Sanskrit, Persian, and Hindustani; and it was vaguely supposed that the Chairman and some of the Directors could understand them; but in this I have much doubt. Finally, the Chairman of the Court of Directors addressed the students, company; and after congratulating the Principal and professors on the meritorious performance of the students, the latter received the exhortation as to their future conduct and study.

intercourse with the people of India; whilst they were admonished to follow the bright examples of the many great and good men who had gone forth from Haileybury before them.

JOHN VALE'S GUARDIAN.

By DAVID CHRISTIE MURRAY,

Author of 'YAI SIRANGE,' 'JOSEPH'S COAT,'
'RAINBOW GOLD,' etc.

CHAPTER XIX.

TOBIAS had intrenched himself in his bedroom, and had rammed against the door the disreputable old trunk in which he carried about his belongings. It was a feeble sanctuary, for at any moment Madame might rail at him from without, and her voice was only a trifle less terrible to the detected sinner than her presence. The wicked old man had had no rum that morning, and to be without rum of a morning was to be the mournfullest sport of destiny. Under such conditions Tobias knew himself liable to mix the false and the true. Futhilliar things took lurid shapes. The harmless poker would assume a threatening curl upon a sudden, and display the liveliest powers of motion. Old acquaintances, who had been dead for many years, and whose bodily presence was on that account at least improbable, held fugitive interviews with him. He had a general knowledge that his apprehension of outward things was tintured with error; but he was powerless to resolve his surroundings to their true elements. A little rum would have cleared everything; but it was Sunday morning, and there was no hope for him until an hour after mid-day.

Whilst he sat meekly enduring a hundred shameful discomforts, he heard Snelling's loud summons at the door of the house, and shortly afterwards his big voice humming and booming in the hall. Now, he thought, Madame would have her hands full; and now, if ever, there was a chance to steal away. He tugged the disreputable old trunk from its place by the door, and was horrified to see it rise on a pair of shadowy hind-legs and to hear it bark at him. It took him a minute or two to recover from the effects of this dreadful phenomenon, and even when he had fairly done so, he walked on tiptoe round it, fearful of awaking new demonstrations. He made for the door, keeping a timorous eye upon the demonic portmanteau. He had already turned the handle, when he awoke to the fact that he had forgotten his hat. The flaccid thing drooped at him with a high-shouldered leer from the mantel-piece. He was nine-tenths afraid of it, badge and emblem of respectability as he knew it; and to get at it he had to pass the trunk of diabolic surprises. He stepped gingerly, sweating and trembling, and anticipatory of a horrible change. Nothing happened. He was safely outside the door, with the venerable relic round his brows. There was something horribly suggestive in the smooth curve of the banisters, and he was uncertain as to what might happen next. But Madam's voice was peeping through the house, and acted on him like a tonic. He slipped through the front doorway, closed the door with a nervous click behind him, and came upon the street.

For a while he potted about aimlessly, but by-and-by, discovering that his unconscious footsteps had led him in the direction of the railway station, he began to think that he had a chance of encountering Mr Snelling there, and of at least making good his expenses of the day before. His thoughts were humble, and soared no higher than that. Isaiah's discovery of his scheme had pricked the inflated, exaggerated hope of Saturday. The fairy realms of Moses & Co. were closed to him, and those smiling, shining rows of barmaids who were to have dram-drinks from him on the morrow had melted into air. The station doors were closed, and he lingered outside the building, furtively smoking a dirty clay, which he hid on the approach of any person of respectable exterior. If Tobias had only known it, he had not been cut out by nature for the shabby old sinner he was. He had miserably misbehaved himself all his life long; but he had so ardent an esteem for the respectable, that the game he played never paid for the candle. The way of transgressors is always hard. There is scarcely a fragment of real truth anywhere for which you cannot find a corollary everywhere. It is as true in morals as it is in business that lazy people take the most pains.

The nervous fingers of poor Tobias went fumbling by nature in one direction or another at most moments. He was one of those men who at any moment of mental emptiness explore empty pockets, not in hope of finding anything, but in shambling excuse for vacant idleness. His hands went prowling now about his shabby old coat-tails, his gray-lipped trousers' pockets, and the dog's-eared pouches of his waistcoat. In the course of these purposeless excursions, his shaking fingers lighted on Snelling's cheque. He drew it out and looked at it with alcoholic tears, as a pilgrim might look at a cancelled passport to the promised land. So little a time ago, and it had meant so much. He remembered the weary way between Castle-Barfield and Beacon-Hargate, and the return journey, still drearier and more comfortless. There was an impersonal pity in his thoughts, as if it were another, and not himself, who had trodden that toilsome road.

Time went uncertainly with Tobias, and he was not sure how long he had wandered about there when the doors of the station were thrown open by a rosy-cheeked, corduroyed porter, who whistled a popular revival hymn tune. A minute later, Snelling broke in sight, walking erect, with his shoulders a little more squared, and his head a little more thrown back than usual. There was something so stern and resolute in his aspect that Tobias would have feared to accost him; but, to his amazement, though hardly to his relief, Snelling bore straight down upon him.

'You're here, are you?' he said. He was not original in greeting, and had offered that affirmative query to Isaiah only a little while before. It was a formula which he employed with people much below him in social rank, and marked at once and decisively their position and his own.

Mr Orme touched the flaccid brim of the silk hat, and made a delicate show of raising it. 'I had not expected, sir,' he said, 'the honour of an encounter; but if I might enjoy the privilege of a word or two, sir.'

'Say what you've got to say, my man,' said Snelling, not displeased by Mr Orme's extreme humility.

'Thank you, sir,' said Tobias. 'I desire to remark, sir, that it was not my fault if I was discovered yesterday by Mr Winter in the performance of my duty.'

Mr Snelling had set himself a part to play, and was not subtle enough to play it by halves. He had adopted the genial rôle, and geniality was only tempered and softened by the reflection that he had been misunderstood and ill-used. He was blusteringly amiable, therefore, in his manner, but the bluster was a trifle chastened.

'Say out what you've got to say, my good fellow. Speak up! There's no need to be afraid of me.'

He still carried the riding-whip with which he had set out that morning, and having slapped his booted leg with it, stowed it under his left armpit with its silver-gilt head projecting. Mr Orme's attitude and expression displayed a full cognisance of Snelling's splendours of demeanour. The little fat abject man drew the cheque from his dog's-eared waistcoat pocket.

'In respect to this, sir?' he said feebly.

'Keep it,' said Snelling; and Tobias, in the whirl of glad excitement, only half heard the words which followed: 'I'm a man as pays a fair day's wages for a fair day's work. You did your dooty, and I make no doubt we shall come up with the lads in a day or two. I shall set my lawyer to work with that view; and if they're contomelious, they'll have to suffer for it, as I've told 'em. In the meantime, if you pick up anything as may be of service, you've got my address, and you can drop me a line.—I'm a man,' said Mr Snelling, somewhat carried away by his new conception of himself, 'as never neglects to repay a service. You act square by me, my man, and I shan't forget you.'

'Thank you, sir,' said Mr Orme, stowing the cheque away in secret haste, lest the big man should suddenly veer from his intention. 'You may rely upon my humble services.'

Snelling bade him a majestic good-morning and walked into the station. He felt generous and self-approving, and saw that his action was on a par with his best opinions of himself. But slow and dull as he was, he saw the necessity of a bolder strategy than he had yet discovered. Somehow or other, Isaiah had lighted upon the truth about him; and let him scout the notion as he might, and let him bury his own vile purpose in as deep and dark a recess as he could find, he had to own a danger. The crime looked natural—as it could only look to one to whom it had been possible. Isaiah's story was grounded on probability, and if it were spread abroad, his neighbours might believe it. If young John Vale came back into his charge, there was nothing possible but the kindest and most fatherly treatment for him. He should have it, or at least he should seem to have it. But—

In the meantime he had to disarm suspicion. He must act, and act decisively, before Isaiah could get back with his story. In Snelling's dull, vulgar, egotistic mind, the thoughts of the whole world pointed in his direction. Nobody is so careful of public opinion as a certain sort of

egotist, for his self-opinion puts him on a fancied pinnacle where all eyes behold him.

Now, how to trick Isaiah? How best to be beforehand with him? The theory of a discharged servant's spite would help him somewhat; but looking at it, he thought it wanting in strength. He recalled suddenly Isaiah's mention of Macfarlane. Whatever real ill usage had befallen the boy had happened to him at Macfarlane's hands. He would repudiate his own orders. He saw an opportunity and a way of doing this at once. The idea fired him, and his sluggish brain moved more rapidly than common. He matured his plan as the local train bore him idly homewards, and before he had reached Castle-Barfield, he was ripe with it, and eager to put it into practice.

Macfarlane had been a Presbyterian in his Scottish youth, and when he had migrated southwards, had made a spiritual resting-place for himself amongst the Congregationalists. He brought a sort of gloomy fervour to the church he joined, and did a good deal of honest hard work in its Sunday school. After years of probation, he had been elected superintendent. Snelling knew that at the time of his arrival scholars and teachers would be gathered together for their afternoon's duties. He was bent upon publicity, and could nowhere secure it so swiftly as by bearding Macfarlane among his subordinates there.

The superintendent was in conference with the mild old minister, and perhaps a dozen of the elders of his staff, when Snelling walked, unannounced, into the room in which they sat. He himself was known as a church-goer, not particularly regular, but prejudiced enough against intrusive outer creeds, and his presence there was a little startling. Macfarlane bustled to him and shook him.

'We are seriously engaged, Mr Snelling,' he said, pressing him a little backward, as if he would lead him from the room.

I venter to think,' returned Mr Snelling, 'that you can't be engaged too serious to spare a minute to clear a fellow-townsmen's character.—There's a shameful story got up agen me, gentlemen,' he added, raising his voice and looking round him, 'and so far as I can gather, Mr Macfarlane is mixed up with it.'

'Really, sir,' the minister protested, 'this is not the place or the time'—

'I know no better,' cried Snelling. 'I know no other. I'll have my case tried here and now.' There was a weight and force about him which made themselves acknowledged. The deep deliberate tones and solid presence were answerable for something, but the overbearing will did more.

The parson drew his watch from his fob and looked about him irresolutely. 'The opening exercises of the school should begin,' he said, 'in five minutes' time from now.'

'Less than five minutes' time will serve my turn,' said Snelling. 'The matter's serious to your superintendent as it is to me. No company of honest men should lose a minute in looking into it.—I'm no hand at a speech, gentlemen,' he continued, 'but I can tell a plain story.'

He stood with his broad-brimmed glossy hat in his left hand and his riding-whip in his right, and now and then emphasised his tale by a motion of one or the other. He could not have

found anywhere a stauncher representative for that figure of high honour he pictured in his mind.

'Most of you know that when my cousin, John Vale, died, he left me his sole exekiter and the guardian of his child. The b'y had had a blow upon the head, and went soft and stupid. Mr Macfarlane had the schooling of him; and the b'y, stinilated to the rash act by a young rascal of the name of Gregg, run away from school. The story they was told to tell was that Mr Macfarlane had beat the lad often, like a savage and without a cause. They was set on furthermore to say that this was done in obedience to my orders.—The whole wicked story comes to this, that I, Robert Snelling, plotted with you, Alexander Macfarlane, to drive the soft lad softer, so that his property might never come into his hands, but stop in mine. Now, I ask you, face to face, Macfarlane, and I call on you to answer like a honest man—Is theer a word of truth in that?'

'Not a word!' gasped Macfarlane—'not a single word.'

'You hear, gentlemen,' said Snelling. 'This is no light thing, gentlemen. If you'll turn it over in your minds, you'll be hard put to it to think of a wickedder charge to bring against two respectable men. I've sacked the fellow as trumped-up the story, and I can do no more. I look for'ard to having the lad home again in a day or two, and my conduct'll prove what truth there is in the tale.—Unfortunately, gentlemen,' he pursued with a tone and manner of mournful allowance, 'our friend Macfarlane's hand is known to be a bit heavy on the youth he deals with.—Not a word agen our friend Macfarlane, gentlemen, not a word. His severity is always meant well; but for once it seems to have had a bad effect. It has lent colour, gentlemen, to a tale which every right-minded man will call owdacious.'

If at this time there were any protest against the rule of Father Stick at all, there was certainly no more than enough life in it to stir the zeal of his defenders. If Macfarlane had flogged a slow and stupid pupil, what other stimulant had ever been discovered for a dull intellect? Your dull ass will not mend his pace for beating; but your dull boy may at least be made to serve as a beacon of terror and warning to boys not dull. The wisdom of Castle-Buffield's forefathers had found no better uges for dull boys at school, and the modern men were not disposed to be newfangled. Snelling's protest looked a little unnecessary to most of them.

'A heinous charge, Mr Snelling,' said the minister—a most heinous charge, and I make bold to say a most unfounded one. Your own known character refutes it, sir.—As for our friend Macfarlane, he is safe in our judgment of him. We have known him too long to change our opinion at the bidding of any scandal-monger.'

'I had a grave charge put upon me, sir,' said Snelling with becoming dignity, 'when the b'y's father died. It was a sore blow to me when the b'y ran away from Mr Macfarlane's school. I felt that I could do no other than put my heel on the snake's head here, amongst gentlemen, some of which has known me from my b'yhood's hour. I am cheered by your confidence, gentlemen, and I shall take no further notice of the

story. I could wish, not as our friend Macfarlane had been less severe, but as the boy's temper might have permitted him so to be.—Good-afternoon, gentlemen.—Your hand, sir—to Macfarlane.—I will not believe for a moment as it is unworthy to rest within my own.'

As he walked back to the inn where he had left the mare, and as he sat there over a somewhat comfortless mid-day meal, to which an appetite two hours deferred compelled him to do more than average justice, he surveyed the scene in memory and approved his own conduct of it warmly. Whatever blame there might seem to be in the matter, he had shifted adroitly to Macfarlane's shoulders, and in the very magnanimity of his forgiveness had strengthened his own case.

In a little while he doubted nothing but that young John would once more be under his guardianship. There would be watchful eyes upon him now, and evil tongues to distort his acts, if anyhow they should be capable of distortion. The day of severity was over, and his first crude and pitiless plan had gone to pieces.

None the less his purpose held. The essence of the land had grown into his blood. He had no scheme ready, nothing but one dark and vague determination. But if John Vale grew up to stand between Robert Snelling and the acres he had set his heart on, it would be the worse for him.

THE CONFUSION OF PROPER NAMES.

It is often claimed for the Prince of Wales that he has an extraordinary memory for names and faces. This may seem a trifling matter, until one reflects how rare such an accomplishment is, and how very desirable it is that a public personage should remember almost everybody—everybody, that is, of importance, and, indeed, a great many of those who are of no importance, but whom it is nevertheless unwise to offend. To remember the correct Christian and surname of a tolerably large circle of acquaintances is a difficult matter; to spell them all correctly, and to avoid confounding, for instance, Mr Smith with Mr Smythe, is almost impossible. Unless one is very careful indeed, Mr Browne's name will sometimes pass without the final 'e,' and then the fat is in the fire with a vengeance. A story told of Moore illustrates how names may be confounded. When in Paris, the poet observed an acquaintance talking to two ladies. Noticing that one of the ladies kept looking in his direction, he asked his acquaintance, when he rejoined him, what was the nature of their conversation, 'because,' said Moore, 'I know you were talking about me.'—'Well,' said the friend, 'the lady observed that she was delighted to have had the pleasure of seeing so famous a personage.'—'Indeed!' returned the gratified poet; 'anything more?'—'Yes,' continued the other; 'she said she was the more pleased because she had herself taken in your celebrated *Almanac* for the last five or six years!'

There is scarcely anything which annoys a man more than to see his name misspelt in a newspaper; and a wrong initial is almost equally exasperating. Thus it is that a good sub-editor, who knows the name of almost everybody in the

district in which his newspaper circulates, is a treasure indeed, as all newspaper proprietors know. Such a man is careful that J shall not be confounded with I, Edmund with Edward, James with John, and so on; and this knowledge can only be acquired after years of observation, and even then only by those who have a retentive memory. When there are in a town several persons with the same Christian and the same surname there is a still greater chance of confusion. In a small manufacturing town in Lancashire there live three gentlemen of exactly the same name, and whenever one of these is mentioned in print, the address has to be given in parentheses. A coincidence of this kind occasionally gives rise to some inconvenience, as was shown a short time ago in a town in Wales. Several magistrates had been appointed; and when the necessary documents arrived, a funny discussion took place in the town council as to *who* was really appointed. There were, it seems, no fewer than five prominent men in the town bearing the same name, and each of these was eligible for office. It therefore took a little time to decide which of them was the new magistrate.

Leitch the painter was called 'Leitch with the itch,' to distinguish him from Leech the *Punch* artist; and an arrangement of this kind would be advantageous in many cases. Not many years ago, the London street *gambus*—according to *Punch*—were wont to discriminate between II. J. Byron and Lord Byron by referring to the former as 'im 'as wrote *Our Boys*.' Every student must have been slightly puzzled at some period of his career in discriminating between father and son, and this task is still more difficult when both have devoted themselves to, and succeeded in, the same art, science, or branch of literature. A good story, with a slightly apocryphal ring, is told of George Colman the younger. Once, after deep meditation, he asked Theodore Hook his age. Hook replied that he had just reached his majority; whereupon Colman muttered: 'Strange! very strange! Extraordinary precocity of genius.' Then he said aloud: 'Twenty-one!—Ah, very good! But, sir, pray tell me how on earth you managed to write that terribly long Roman History?' That Colman had never heard of Dean Hook is scarcely credible; but the mistake of confounding persons who were or still are in the same 'line of business' is made every day by the 'general reader.'

If hereditary genius were more common, the confusion of names would be much greater. Parents generally call the first-born after one or other of its more immediate predecessors, and when these are exhausted, after the aunts and uncles, &c. on either side. Thus, it frequently happens that a certain Christian name runs in a family for generations. Great men, too, seriously affect the variety of Christian names in their own and succeeding generations. Despite Juliet's assertion to the contrary, many persons evidently believe there is something in a name; just as Mr Shundy maintained that the misfortunes of the hero of Sterne's remarkable work were due to the mistake of Yorick in rashly christening the boy Tristram, and not Trismegistus. For some time after the Conquest the name of William was very popular; and a lady who well remembers the jubilee of George III., says that in the west of England

most of the children born that year were christened George or Charlotte Jubilee. At one baptism, the lady adds, after several girls were named Charlotte Jubilee, on a boy being presented the old clerk shouted 'George Jubilo!' thinking the other termination feminine. It will be fresh in the recollection of many that during the Queen's jubilee year many children had conferred upon them the name of Jubilee; but an enthusiastic American went still further, and named his child, which was born on the 19th of June 1867, Victoria Jubilee! If this child should reach maturity, one cannot easily calculate what pondering and vexation of spirit this name will cause to some of her correspondents, especially if her autograph is as illegible as autographs usually are. Touching the general practice of bestowing Christian names on children, Camden (*Remains*, 1605) notes a rather curious fact. 'Two Christian names,' he says, 'are rare in England, and I only remember His Majesty and the Prince with more.' It would be interesting to know when the custom of almost invariably giving two Christian names originated.

The old clerk who was so particular about the proper termination was not so very far wrong in his sentiments, after all. The confusion of proper names is quite perplexing enough when female children are christened by names which are usually bestowed on the sterner portion of mankind; but the confusion is greatly enhanced when males are made to bear purely feminine appellations. Maria, for instance, was borne by Daubenton the naturalist, Jaquard of the loom, and Weber the composer of *Der Meisterschütz*. History affords other examples in the cases of Anne de Montmorency, Constable of France; Anne Hilarion Tourville, the great admiral; or Anne Louis Girodet, the celebrated painter. This mixing up of names is not very general, otherwise the decision of a learned Chief-justice in a recent case, that because a certain person was named Elizabeth was not legal proof that she was a woman, would have been more intelligible to the jury. What the twelve good men and true, or, indeed, any equal number of men, would have thought of such a name as 'George Anne Bellamy,' supposing that they had never heard of that popular actress of the last century, it is difficult to say. These designations were conferred on this lady by a parish clerk, instead of Georgiana; but George Anne she was christened, and George Anne she always called herself.

Themistocles is reported to have been able to call by name every one of the twenty thousand dwellers in Athens; but with the majority of persons this is a very weak point. Everybody knows the familiar story of a young lady who had forgotten a gentleman's name, and who sought to obtain it by a little dissembling. 'I beg your pardon,' she said, 'but how do you spell your name?' 'S-m-i-t-h!' he replied, with some surprise, to the momentary discomfiture of the questioner. But she quickly recovered herself, and with great presence of mind said: 'Thank you. A great many people of your name spell it Smythe, you know, and this was my reason for putting the question.' Another good plan was recently adopted with success by Ellen Terry, who being under some obligation to a newspaper man, offered to introduce him to Mr Irving; but unfortunately, when an opportunity for doing so

presented itself, she had quite forgotten his name. She felt it would be an ill compliment to tell him this, and so, with ready wit, she resorted to a little stratagem. 'Do you know,' she said, 'I've made a wager with Mr Irving, and you can decide it. He says you spell your name one way; I say another. Write it for me.' Unaware of the trick which was being played upon him, the gentleman wrote his name and handed it to the actress. She glanced at it hastily, laughed guiltily, and said: 'I've won the bet.' Very few persons could dissemble cleverly enough to get over the difficulty in this way. Still, an artifice of some kind has frequently to be resorted to by many in order to obtain the desired information without hurting the feelings of an acquaintance by confessing that his name has slipped their memory.

OGILVIE WHITTLECHURCH.

IN FIVE CHAPTERS.—CHAP. I.

'THERE will be no half holiday this afternoon.'

It was Dr Layton of Olswick Grammar-school who spoke. His audience consisted of the ushers and pupils of that establishment.

The announcement was not altogether unexpected. In fact, two young gentlemen were already secretly congratulating themselves on having got off so easily. But their hopes were destined to be dashed to the ground—the doctor has not finished. How much does he know?

'I said, young gentlemen,' he continued, 'that there would be no half-holiday; but I speak with a reservation. If I can possibly avoid it, it is not my plan to punish the whole school for the fault of a few of its members. I call on those boys who robbed Mr Hodge's orchard yesterday to give me their names. Unless I am greatly mistaken, they will do so. Will those boys stand up?'

Amidst a breathless silence, two lads stood up in their places.

'Is there no one else?' asked the doctor.

Then every one looked at every one else; the big boys began to look very fierce, and the small ones to look very red.

'I have reason to know that there is another boy who ought to be standing up. I will give him a minute to do so.' The doctor took out his watch. 'What an age that sixty seconds seemed! 'Ogilvie Whittlechurch, stand up.'

The boy addressed was a slender delicate little fellow in the first form, but with an open and intelligent face, not at all the face of a sneak. Scarcely seeming to take in what was happening, he obeyed; and then, seeing the gaze of the whole school concentrated on himself, burst into tears.

'I am sorry,' said the doctor sternly, 'very sorry to find that there is a boy in my school who can descend to a lie—to find a boy who is mean enough to see his companions punished while he himself goes free. The school may dismiss him now, and leave their books out. There will be no half-holiday; we will resume work at three o'clock.—Parkins, Rimington, and Whittlechurch, go to my study.'

Fifty boys do not allow themselves to be robbed of an afternoon's cricket without some retaliation,

and many were the threats indulged in of 'bed-room lickings' and 'monitor thrashings' to be afterwards administered to the unhappy Whittlechurch. Besides, to do them justice, English schoolboys have a strong sense of honour; and if a master will but show by his conduct that he appreciates and trusts in this sense, public opinion is always against a boy who takes advantage of him.

There had been a paper-chase the day before, and the hares on their return journey had passed Hodge's orchard with the hounds close on their heels. Of course, at this, the most exciting part of the whole chase, none of the bigger boys, nor the good runners among the smaller ones, would have turned aside for all the orchards in the county. But the three unfortunates who were interviewing the doctor were known to have straggled early in the day, and nothing was more likely than that they had yielded to the temptation of lightening some of the overladen apple trees of their golden burden, more especially as Farmer Hodge was the avowed enemy of the school, and was said to have sworn to make the next boy he caught acquainted with his cart-whip. But how the doctor had 'bowled out' Whittlechurch, no one could imagine.

Presently, the school-bell rang, and all trooped in again and took their places as before. Parkins and Rimington were already in theirs, looking very sore and uncomfortable; but Whittlechurch was not in the room. When every one was seated, the doctor tapped his desk for silence, and proceeded to address the school: 'Whittlechurch is expelled. He persisted in denying his guilt; and as I have often told you that I will not be responsible for the charge of a liar, I had no course but to send him back to his father. That he was guilty, there can be no doubt. When Mr Hodge's complaint reached me yesterday afternoon, I walked over to his farm. We went into the orchard, and there I saw his full name, "Ogilvie Whittlechurch," cut on an apple tree. The work was quite recent; it could not have been done more than a couple of hours at most; and in the face of this evidence he still refused to admit that he had been in the orchard.—Let this be a warning to you, young gentlemen. Never be tempted to tell a lie. If you do, you will most assuredly be obliged to tell a score more to substantiate it. But were you to tell a thousand, the end will be always the same—detection.'

While the fifty or so young gentlemen at the Olswick Grammar-school were poring over their books in the worst of tempers, and looking wistfully out of the windows at the cricket pitch, which now appeared doubly green and smooth—while, in short, these youthful aristocrats were extremely miserable, some twenty little paupers, inmates of the Olswick Union, were in the very wildest of high spirits. 'The board' had just concluded its annual inspection, also its annual luncheon, and its annual cigars—the last two forming, by the way, a very considerable item in the annual bill chargeable to the ratepayers—and everything having gone smoothly, the chairman had requested the master of the workhouse to allow the old paupers a ration of tobacco and to give the children a half-holiday.

'Ooray! ooray! Chuck 'er up!' shouted one little ragamuffin.—'Oo's a-goin' to play, tipcat?'

cried another.—'Where's Oggy Whittlechurch with them happles?' yelled a third.

'Sh-sh, yer sofly! D'yer want to git 'im nabbed? Oggy's took the happles over to the meadow. You come along a-mie, and we'll ave a blow-out.' So saying, the last two speakers separated from their companions, and running round behind the workhouse, cautiously crossed the garden. This brought them to a stone wall, over which they clambered. They were now in the meadow, and here, sure enough, sitting close to the wall, they found another little fellow waiting for them.

'Ave you got 'em, Oggy?'—'Ave you got the happles?' they both asked at once in an eager whisper.

'Ave I got 'em!' replied the other contemptuously. 'D'yer think I've left 'em behind?' And producing a piece of sacking tied up in a bundle, he proceeded to undo the knot, thus allowing to roll out a store of fine ripe red-cheeked apples.

'O blimy! ain't they prime?'

'Ere's one for you, Bill; 'ere's one for Charlie Miller; and 'ere's one for me. 'Ere's two for you, 'ere's two for Ch—— Douse it, and cut! Can't yer see the Squire comin'? My! ain't 'e runnin'!'

The two lads who had just come were over the wall again before he had finished speaking. But the one who had been distributing the apples stayed for a moment to tie up the bundle; then, just as he was about to follow them, he suddenly saw the Squire trip up and fall heavily to the ground; and at the same time realised what he had not noticed before, namely, that the gentleman was not pursuing himself and his companions, but was trying to escape from an infuriated bull, which now made its appearance through a gap at the other end of the field, rushing madly, head down, straight for where he lay. What impulse prompted him he never knew. Had he waited but a fraction of a second to think, he would most probably have followed his companions. But he did not think. He ran as hard as he could go to where the gentleman was lying—the bull was now within six yards—picked up a stone, and threw it at the animal with all his force. It hit the latter between the eyes. The effect was instantaneous. The bull stopped short, tossed his head, half-turned round, and then catching sight of some blankets hung up to dry, which were fluttering in a cottage garden near by, made off in that direction at the top of his speed.

Meanwhile, the Squire, who had twisted his ankle, had with some difficulty got up; and leaning partly on the boy and partly on his stick, hobbled to the gate. 'What is your name, my little man?' he asked.

'Ogilvie Whittlechurch, sir.'

'Queer name that for a pauper,' he muttered. —'Well, Ogilvie Whittlechurch, run back to the workhouse and tell the master that I want to speak to him.—Do you understand? Tell him that Colonel Forward wishes to speak to him.'

'Oh, p-p-lease, sir, we wasn't doing no 'arm. Leastways, the other two wasn't. You'll only tell 'im of me, sir? Will yer?'

'What do you mean, my lad? I don't understand.'

'Ain't yer goin' to tell 'im to whack us for

comin' in the meadow? But you'll only tell 'im of me? Will yer, sir?'

'Oh, I see.—All right, my boy, I won't say anything about the others. Now, off you run, and fetch the master.—By Heaven!' muttered the colonel as he stretched out his leg, which was rather painful, 'but I like that youngster extremely.'

For a few moments he remained thinking; then, half-aloud, he muttered: 'Why shouldn't I? 'I'm an old bachelor, and likely to remain one. When I die there is no one to carry on my name. Yet I suppose that this is the kind of step that one ought to think over before taking. But then I don't fancy that the boy thought much when he saved my life just now. I wonder who he is. I don't ever remember having heard the name before; but it certainly does not sound a plebeian one.—However, here comes the master, and I'll find out.—Ah, Mr Saunders, I want to ask you about that youngster, Ogilvie Whittlechurch. Who is he, and what is he?'

'Oh, the young scoundrel, sir; he told me that you caught him in your field; but I'll take good care that he doesn't do it again. He's the most mischievous boy in the 'ouse, sir. But he's not altogether a bad lot—he always speaks the truth.'

'Humph! Always speaks the truth, and thinks of his companions before himself, besides being as plucky a youngster as one could wish to see. Why, the boy must have been born a gentleman! Colonel Forward was evidently a bigoted aristocrat. 'Never mind the trespassing, Mr Saunders. I take an interest in the lad, and want to know who he is. How did he come to the workhouse?'

'We have never been able to find out who he is, sir. 'I was found one morning in the garden, wrapped up, in a shawl. It was just after I came here; I remember it perfectly. He couldn't have been there very long, because the shawl was hardly damp, and the dew had been very heavy. But we never knew who put him there.'

'How was he dressed? Were his clothes good?'

'Not very good, sir; but quite clean. The matron has them now. But there was no mark on them, sir, nothing at all; only "Ogilvie Whittlechurch" written on a piece of paper and pinned on to his frock, as you might label a parcel.'

'And is that all you know about 'him?'

'Yes, sir.'

'Mr Saunders'——

'Yes, sir.'

'That boy has just saved my life at the risk of his own, and I intend to adopt him as my son. Inform the guardians, please, and let me know their answer.'

'Wh—wh—what! sir?'

'I say that I wish to adopt Ogilvie Whittlechurch. Surely that is plain enough. Now, if you will kindly lend me your arm as far as my house—thanks.'

Colonel Forward had acted, as we have seen, quite on the spur of the moment; and it was not until he came to think the matter over calmly, while smoking his after-dinner cigar, that he fully realised the magnitude of the step, and the great responsibility which he was about to incur. At

best, it would be a hazardous experiment. However, having undertaken it, he would spare no pains to make it a success. And he determined that it should be through no fault of his if Ogilvie Forward—for so he intended to name him—turned out anything other than an honourable English gentleman. He did not care much for the neighbourhood, and had long meditated selling his present residence. Now, it was clearly his duty to do so at once, as it would never do to bring the boy up within a stone's throw of his old companions. This point settled in his own mind, he sat down and wrote the necessary instructions to his solicitors, smoked another cigar, and went to bed.

Ten years have elapsed—years which have passed happily both for Colonel Forward and his adopted son. At nine a boy's ideas are unformed; his mind, is so to speak, pliable, and he is ready to take in new impressions. So that, when, after a few years passed with his kind protector, Ogilvie was sent to Eton—if we except perhaps a sound healthy constitution and good physical development not a trace remained of his early workhouse training. As for the colonel, he has learned to love him more and more each year, and now blesses the impulse which prompted him thus to secure himself the solace and happiness of a son's society, and saved him in all probability from that terrible affliction, a joyless old age. His worldly fortune, it is true, is now considerably less than it was. The reason—speculation, in which, like many other retired officers of comfortable means who feel keenly the want of occupation, he had been tempted to engage. However, he still had enough to live on; but, for his son's sake, he regretted that it was not more.

From Eton, Ogilvie passed into Woolwich, and from Woolwich he was gazetted lieutenant in the Royal Engineers. His detachment was stationed at Leith, where they were employed renewing the submarine defences of that port. When the main part of the work had been completed, several of the officers, Ogilvie among the number, sent in their applications for leave, which were approved in due course. His plans were to devote a week to a short walking-tour in the neighbourhood, which he had hardly as yet had time to see at all; and then to spend the rest of his leave with his father. Accordingly, one fine June morning, stick in hand and knapsack on back, he started on his travels. It was quite early, and, except for a few workmen, the streets were practically deserted. There were also a few sailors hanging about the dockyard gates. One of these latter, who had been sitting on a bundle against the wall, got up as he passed and followed him. Looking round a few minutes afterwards, he noticed that the man was still behind him. 'I wonder if that fellow can be following me for any reason?' he thought; and then smiling at the idea that he was getting as fidgety as an old maiden lady, he dismissed the subject from his thoughts.

It was a delightful morning, bright and exhilarating, and under the combined influences of the freshness of the weather and his own light heart, he stepped out briskly. When clear of the town,

he stopped for a minute to readjust the straps of his knapsack, and, while doing so, had leisure to inspect the sailor, who was a few paces off. His appearance was certainly not in his favour. He was about middle height, solidly built, with a short thick neck, and bullet head surmounted by a fur cap. His face, which was adorned by a scrubby black beard and moustache, indicated both cunning and ferocity. His bundle and a pair of big sea-boots, as well as an indescribable something about his walk and carriage, showed him to be a sailor. But had it not been for these, one would have felt more inclined to put him down as a professional burglar than anything else.

What, then, was Ogilvie's astonishment when, just as he was putting on his knapsack again, the individual we have described walked coolly up to him and thus accosted him: 'And so you're Capturing Forward.'

To the best of his knowledge, the man was an utter stranger; and he was so taken aback with his impertinence, that for a second or two he continued to take stock of him before answering. 'Yes,' he replied, 'I am Mr Forward.'

'And you don't remember me?'

'No.'

'What! you don't remember your old pal, Charlie Miller—and we used to be that fond of each other, too, we used. Now, try to think, capturing; surely, you must remember Charlie. Having said this in a mocking tone, the man remained looking at Ogilvie, his face torned into a half sneer, half grin, which had the effect of making him look absolutely hideous.

Suddenly a light broke on Ogilvie; it all came back to his memory now, the old days at Olswick, and the little paupers, his companions. He did remember him. With an inward shudder, he had to acknowledge to himself that this person had once been his friend. Naturally kind-hearted, he would, under ordinary circumstances, have been only too glad to do a good turn to one of his old associates, notwithstanding that their present paths of life were, and necessarily must be, on levels so very different. But suddenly confronted with him like this, he felt towards him a repugnance which he could not overcome. He made, moreover, a shrewd guess that it was not alone for the pleasure of greeting an old acquaintance that Miller had tracked him down; and events showed that he was right.

'Now that you remind me,' he continued, 'I do remember you. You were one of my playmates before Colonel Forward adopted me. How did you find out where I was?—and what can I do for you?'

'Ah! now you're beginning to speak. You were only talking before—Never mind how I found you out—that don't matter. As for what I want—well, what d'yer think I want? Not money.—Oh no! 'Tisn't likely. What I wants is L, and S, and D; but cheffy L, and that with a fifty after it; that's what I want.'

'Fifty pounds!' said Ogilvie. 'I cannot give you as much as that—certainly not now. But why do you want it?'

'Well, capturing, you see, I was always very fond of yer; and hearing that the other young toffs down yonder at the barracks didn't know as 'ow you'd ever been anything different from what

you are—and you bein' in course to modest to tell—I thought, d'yer see, as I'd be doin' you a good turn by lettin' 'em know the 'ole story. They'd respect you, so I thought—you 'avin' made your way so wonderful—it commands respect, that does. But this morning I thought—I was thinking of yer all this morning—afore you was up, I was thinking of yer—I thought this: Oggy weren't never a boaster, and p'raps 'e'd rather I didn't say nothing atter all. So, when you come out of the barracks, captin', I says to myself: "Well, I'll just ask 'im myself," I says; "and if 'e tells me to clap a stopper on my jaw-tackle—well, p'raps 'e'll come down 'an'some."

'So!' thought Ogilvie, after listening to the above speech, which was delivered in a sarcastic tone, showing that the speaker imagined that he had him completely at his mercy, 'this is nothing more or less than a deliberate attempt to extort blackmail.'

Now, although his brother-officers believed him to be Colonel Forward's son, he was sufficiently popular in the mess not to mind the true facts of the case coming to light. At the same time, however, he did not like the idea of this man appearing at the barracks in his absence with a sensational story which would most likely be adorned with numerous embellishments of his own. Of course, no one in the mess would listen to him; but that most probably would only have the effect of making him retail it in the canteen, which would be worse. Take it which way he would, it was a nuisance; and unless he chose to return at once, and so spoil his walking-tour, which he had no intention of doing, it could not be helped.

'Not only will I not give you fifty pounds,' he answered, 'but I will not give you fifty shillings. What you propose to do can cause me nothing more than a little temporary inconvenience; so please consider yourself free to go and do it as soon as ever you please. If you have nothing more to say to me, I will go on with my walk.'

The other's face fell visibly. This was not at all what he had bargained for. 'What! you don't mind them young toffs knowing you was brought up in the Union along a-me?' Then suddenly changing his tone, he continued: 'But there! you knew Charlie Miller wasn't a-goin' to play a low-down game like that, didn't yer? Why, bless yer, Oggy, I was only larkin'. And to think you been and seen through it—and me thinkin' I was a goin' to give you such a fright too. But, captin', if you 'ave got a thick-un or two to spare, I'm dead-broke—I'm really—been bousing up my jib all last week, and ain't got a dollar left. I want to get a ship at Glasgow, and by what I can see, I'll 'ave to tramp it.'

Many people would have been equally deaf to this second appeal; but Ogilvie, although fully alive to its insincerity, could not help giving the fellow a sovereign. After all, but for a strange turn of the wheel of fortune he would very likely have been his friend to this very day, and been instrumental in keeping him straight. 'Look here, Miller,' he said. 'I have not forgotten that we were boys together; but circumstances have altered our positions, and we can have nothing in common now. Here is a sovereign. I hope

you will find a good ship at Glasgow; and let me advise you for the future to stick to your business, and not run about the country trying to frighten people into giving you money. It doesn't pay.—Now, good-bye.' And turning on his heel, Ogilvie walked off in the direction of Queensferry.

For a few moments the other remained watching him in silence; but finding that he did not even look behind, he turned and commenced to retrace his steps towards Leith. 'Blarst 'im!' he muttered. 'I thought 'o'd be worth a mint o' money to me. But I won't blow on 'im—'twouldn't be no good. Besides, a secret's a secret, and maybe it'll be worth something yet.'

WIRE-DRAWING.

THE business of wire-drawing consists in reducing the metal from the state in which it is technically called 'rods' to the finished wire. The 'rods' are the metal which has been rolled hot, and reduced from a square to a round shape, and are generally about a quarter of an inch in diameter; and this manufacture of rods is a separate and distinct business from wire-drawing. The wire is drawn cold through steel plates in which a hole is punched, and the process of reducing the size is done gradually, that is to say the wire is passed through a succession of holes, thus gradually decreasing its size. A wire-drawing bench consists of a long table or bench, on which are placed a succession of cylinders, which are made to revolve by means of wheels placed underneath the bench. The wire to be operated on is put in a coil on 'swifts,' which are placed upon the floor in front of the bench; and these swifts consist of an upright frame of stout bars arranged in the form of a truncated cone, which revolves as the wire is drawn on to the block, the plate which is to reduce the size being placed between the 'swift' and the 'block.'

It is obvious that the wire cannot be pulled through the plate by means of the revolving block until the wire has become attached to the block; and as the point-end of the wire has to be first passed through the hole in the plate before it goes on to the block, some means must be provided for drawing the point-end of the wire through the plate to a sufficient length for attachment to the block; and this is provided for by a bar with a pair of pincers at the end of it, with a couple of links attached to the end of the pincers—to the ends which are held in the hand in the case of an ordinary pair of pincers—and these links are joined to a single ring at the end of the bar, so that when the other end of the bar is pulled, the jaws of the pincers come together and grip the piece of the wire which is first threaded through the hole in the plate. But the force necessary to draw the first yard or so through the plate, to give length enough to attach to the revolving block, would be very considerable, and this power is applied by a simple arrangement. At the bottom of the upright block is a screw constantly going round horizontally, and the block; but this cam in its sweep catches the end of the bar to which the pincers are attached at the opposite extremity, and thus causes the

pincers to pull round in the direction in which the block is going, dragging the wire through the plate till there is length enough to attach to the revolving block, when, by putting the foot on a treadle, the block is brought down so that the cam is under the level of the table, and the pincers lie idle until they are again required. The wire now goes on winding round the block, and is wound off the swift, which is on the floor, and through the drawing-plate, until all the supply from the swift is exhausted.

The metal on the block is now 'drawn-wire'; and the process is repeated by running the wire through a smaller hole, and so on until it reaches the required size.

The wire, however, becomes harder with each hole it goes through, and it will ultimately become so brittle that it would break like glass unless it is softened. The coils are therefore taken away from the drawing-bench and are placed in an annealing furnace or pot, where they are subjected to a considerable heat, for a longer or shorter time according to the degree of softness required. This annealing causes a 'scale' to appear on the wire, and this must be removed before the wire can be again drawn. The rings are therefore taken to a bath, consisting of what is termed 'salts,' that is, an acid solution, which removes the scale and leaves it in the bath. The wire after being left as long as is necessary in the solution, is taken out and washed, and then dipped in a trough containing a paste of slaked lime. Then the rings are put into an oven and baked until the lime forms a dry coating on the wire, which is now ready for re-drawing.

Even with this coating the wire cannot be passed through the plates without soap or grease being applied to it before it passes into the plate. Some classes of wire are also subjected to a tempering process, which all wire-drawers keep secret as far as they can, and this process adds greatly to the strength and toughness of the metal.

A soft metal which has been annealed is exceedingly tough and is difficult to break by bending; but in this condition it is of low breaking strain, that is to say it will only resist a comparatively small strain under direct pull; but when it is drawn through the plate the strength is increased and the toughness reduced, so that the object to be attained in wire-drawing is to combine the greatest amount of toughness with the required breaking strain.

The breaking strain of steel wire varies from forty-five tons per square inch to one hundred and twenty or one hundred and thirty tons; and the skill of the wire-drawer aims at producing that quality of wire which shall best attain the special characteristics required and at the least cost. The keen competition which now exists in this, as in almost every branch of industry, has unfortunately resulted in such a cheapening of the wire as to render it impossible to produce the best article at the lowest market prices in each class of material, because, unless a good metal is commenced with in the rods, it is impossible for the wire-drawer to produce a finished article of first-rate quality, although the very best skill may be put into the work; but if his object is to make the cheapest possible article from the material at his command, he may so reduce the labour expended on his metal as to considerably cheapen his production, but at

the expense of the enduring quality of his finished article.

Of late years the use of iron has been to a very great extent superseded by steel of low qualities, because a cheap steel can be produced at less money than good iron; but this cheapening is not attained without in many cases a loss of working quality. On the other hand, some of the results now obtained could never have been achieved by the use of iron, as, for example, where great strength is required combined with lightness in the article into which the wire is worked.

The purposes for which wire is used are extremely numerous. Perhaps the largest quantity is consumed for telegraph-work, for land lines and for submarine cables. Much is also wanted for wire-ropes, which have almost superseded hemp-ropes for colliery and engineering purposes. Then, again, there is spring-wire for beds and upholsterers' work. In this case the wire should be 'coppered,' to prevent its rusting, and this is done by drawing it through a solution of sulphate of copper, which leaves a thin film on the iron after it has passed through the draw-plate. Wire for fencing and for galvanised netting is a very considerable item.

Needle and pin wire making is also a considerable manufacture. Square and 'paragon' wire for umbrellas also occupies a great many hands. Copper and brass wire-drawing forms an industry quite distinct from the manufacture of steel and iron wire, and the same firms do not usually produce both classes of metal.

The men engaged in wire-drawing are usually paid by the 'piece'; that is to say, they get so much per hundredweight for the quantity they draw, and they have thus a direct interest in preventing waste occasioned by breaking the wire in passing through the plate, and the men acquire considerable skill from long practice. They do not all do the same kind of work; some men, for example, are specially skilled in the production of 'fine' wire, that is, wire of small diameter; but notwithstanding all the care which may be exercised, there is a good deal of waste by the wire breaking into short lengths when it is reduced to very small sizes.

There are also men who are specially skilled in drawing 'shaped' wire; that is to say, wire of shapes other than round, as, for example, square, oval, half-round, and other special forms required for particular purposes.

The wages paid to the men here are higher than on the Continent, and consequently the foreign maker can produce a wire for less money than we can in England; and owing to the facilities given by the foreign railways, a foreign maker often incurs less carriage for delivery in England than is expended in the railway rate from one part of England to another. The Englishman beats the foreigner in the quality, and consequently wire is exported from here, notwithstanding the dearer wages and heavy carriage; but the quality of many makes of wire is being reduced, owing to the consumers of the finished article into which the wire is made seeking to buy at less and less first cost, generally thereby ensuring to the user an increased cost in the long run. This would seem to be a very short-sighted policy, for the user seems to forget that the maker cannot continue to give twenty-five shillings worth

of goods for twenty shillings; and in these days of over-production, the wire-drawer has first to reduce his prices as low as he can without deteriorating the quality, and then, if his customer still wants lower prices, he has to take it off his cost of the raw material, with the inevitable result of reduced quality, although the article may be sold by the same name as formerly. It is also certain that a wire-drawer who knows all about the material he is dealing with can select his metal so as to give the results he requires; but he cannot make a good sound wire from an inferior metal, however well he may do the work which by the division of labour has fallen to his share.

GHOST CUT GHOST.

THAT cold-blooded demon which we call Science is killing romance from amongst us. Years ago everybody believed in the wonders of the invisible world, and ghosts were among the regular inhabitants of every rural district. Now, we are so seldom suffered to see or hear of a ghost, that a visitation has the effect of novelty. So far as we know, the story of one ghost outwitting another is absolutely unique. The story which we purpose to tell is of this character. We tell it as it was told to us by the most noted detective in the Western States of America.

You may imagine (said Nathan Dodge) that during my career as a detective I have had some singular jobs given me to work on. There was one little piece of business which I always look back upon with a good deal of professional pride, although the ending was a very sad one. It was a case of diamond cut diamond ghost cut ghost, I call it—and it took up my time for the better part of six months.

About ten miles outside the limits of San Francisco I'm speaking of about twenty years ago—stood a large farmhouse. This house had been vacant for three years before I saw it. The original owner had been murdered there, and the house and farm had passed into the hands of his brother, who was a New York gentleman. At that time, gold-mining was the staple industry of California, and San Francisco especially was under the spell of the gold fever. Little attention was paid to developing the agricultural wealth of the soil, which now promises to be so vast as to rival that of the gold-beds. So the New Yorker, being unable to find a tenant for the house and farm which had passed into his hands, left them to take care of themselves. Now, a wooden house left to take care of itself is in a very bad way, and though for a time the house was not altogether without tenants, they were not such as took upon themselves any responsibility for the necessary repairs. Parties of two or three miners occasionally stopped at the house all night: these were its only tenants. But by-and-by it was deserted by even those chance visitors; for it began to get about that the house was haunted. The panic caused by this report was such that for love or money you couldn't have hired a carpenter to enter it even in the daytime. Of course I'd heard of the haunted house; but as detectives are never called upon to arrest ghosts, I felt no particular curiosity about it.

One morning our chief put into my hands a case against an absconding secretary named Coffin. Coffin was the secretary of the White Mountain Mining Company. All the funds had been under his control, and he had got away with some ten thousand dollars belonging to the shareholders. My business was to find him.

It is always a very good plan to begin at the beginning. So the day I received my orders, I went to the Company's office and overhauled everything. The only thing that I could find was a railroad ticket for New York. I went to the depot, and found that it had been issued to the defaulter the day before he absconded. Apparently, it had been left behind by mistake, and I did think of taking the next train to New York. But it occurred to me that if he had been going to New York he would have gone under another name, and would not have left behind so obvious a clue as to his whereabouts.

A visit to his landlady convinced me that New York was the place he hadn't gone to. He'd gone away without his trunks or clothes. The only things that were missing were a suit of clothes, a stout pair of boots, one or two clean shirts, some collars, a wide-awake hat, and a black valise. He had left the town at night. No one had witnessed his departure. Here was a good chance for a detective to work by the inductive process—from small beginnings to work on and on from clue to clue until he bagged his man.

The only thing that I could do was to work all the roads leading out of the town. After about a week at this, I found a farm-hand who had seen a foot-passenger resembling my man the morning after he absconded. I followed this trail, and soon became positive that I was on the right track. Coffin was a shrewd fellow. He had planned the embezzlement and escape carefully, and had made elaborate preparations for playing what we call the 'chameleon game,' that is, for changing his clothing, headgear, and face at every stage. To this end he had possessed himself of a change or two of clothing, a stock of hats, and any quantity of whiskers; and he rung the changes on these pretty frequently.

The black bag was the only thing that I had to rely upon as a pointer. Fortunately, a man on tramp with a black bag was not in those days a common sight; and I had less difficulty in following Coffin's trail than might be supposed. The first time I heard of him he was a smooth-faced gentleman dressed in shabby black, looking for all the world like a broken-down gambler going to retrieve his fortunes in some mining camp. The next he was a middle-aged doctor with a flowing beard and heavy moustache. Later on, he was playing the rôle of a Company promoter, offering to buy up mining claims on behalf of an English syndicate. He was then attired in a check suit, a light hat, and side whiskers. At this stage I obtained positive proof that I was following the right man.

Entering a drinking saloon I saw upon the shelf a photograph of Coffin. The edges were slightly charred. It had evidently been burnt. I told the landlord that the owner of that face was a particular friend of mine, and asked him how the photograph came into his possession. He told me that his hired boy of colour had picked it out of some burnt papers which had been left

in the room of one of his guests; that the boy—not understanding what it was—had brought it to him, and that he was displaying it in case the owner returned and wished to claim it. Was it like his guest? Not in the least.

I went into one of the outhouses to look for the coloured boy, and found him sitting on a log singing:

Blow dat horn agin;
Bredion, fr'onds, companions dear,
Blow dat horn agin.

I made a dollar the avenue to that boy's confidence, and quite unwittingly he gave me the information for which I was seeking. The bright fastening of the bag had aroused his curiosity. One day, in its owner's absence, whilst he was playing with the lock, the bag flew open, revealing 'dead men's whiskers.' The sight disconcerted him. He felt, as he expressed it, 'in a hurry all over;' and whilst he stood over the bag, its owner returned, and rewarded him with a vicious kick.

After that I thought I should have no difficulty in laying my hand on Coffin. My calculations deceived me. I found that he was 'doubling,' and traced him almost as far as the suburbs of San Francisco. There I lost all trace of him as completely as if the earth had swallowed him up.

Months afterwards, feeling vexed and disappointed, I dropped into a saloon at the outskirts of the town to get a 'liquor.' I had had as pretty a dance after Coffin as any man need want; but the interest of the game supported me, and I was determined not to give it up. There were three or four miners in the bar, and one of them was evidently greatly excited. His companions seemed to be ridiculing him, and he was getting what we call 'ugly.' I made my way towards the little knot of talkers, and overheard the following conversation.

'So, you didn't think much of your lodgings in the haunted house, Bill?'

'No, I didn't—no two ways about it.'

'What did you hear?'

'Twasn't what I heard 'twas what I saw.'

'What did you see, then?'

'Why, the doors openin' and shuttin' without anybody touchin' 'em.'

'None-o, man!'

'None-o be blowed! I tell you they did. And when I drew my six-shooter and fired half a dozen shots clean through the door—makin' the all-firedest row you ever heard—the door kep' openin' and shuttin' and playin' tunes. I felt like a gone sucker, you bet. My heart began to bump so under my jacket that it's a wonder it didn't knock a button off. I wouldn't go there agin for all the money in the State. But if anybody here thinks I'm a coward, he's only got to say so.'

It suddenly occurred to me that I had located Coffin—that he was the ghost in the haunted house. A vague suspicion of this sort had, it is true, fitted through my mind before; but now, without being able to explain why, I felt certain that, however impossible it might seem, Coffin was the ghost in the haunted house. Beyond the fact that the fame of the haunted house was widespread, and that everybody knew

of its existence, there was nothing to support my theory except the maxim of the most famous of all detectives—a maxim destined to assure his after-fame: 'Always suspect that which seems probable; and begin by believing what appears incredible.'

I determined to call in the aid of another detective and visit the place next night. I chose for my companion George Webber, one of the most esteemed members of the force, a man who had proved his worth. Webber was a man of imperturbable calmness, and with great confidence in himself. He would have laid his hand upon the most dangerous criminal as tranquilly as if he had been accosting a friend.

The haunted farmhouse was situated about a hundred yards from the roadway. What once had been a garden was now a veritable jungle, given up to weeds and bushes. Fortunately, although it was ten o'clock, the night was clear. Innumerable stars lit up the flinty sky. There was no light in the house; no sign of its being inhabited. The windows of the ground-floor were broken, and some of the doors were open. We entered at the rear. A place of more sinister aspect I never saw. The plastering had crumbled from the walls; the flooring was rotten; the ceiling looked as though it might fall at any time, the rafters being bent as if they supported a heavy weight.

The sitting-room where 'Bill' had taken up his quarters a few nights previously contained a rough table and a few stools, which had been overturned. I could see that the door which led from it to the staircase had been riddled by bullets. There was a doorway in the passage, but the door was gone. The door which led into the parlour opened noiselessly. Our lanterns revealed the fact that the tables, glass, and chairs had been overturned, thrown in every direction, trodden upon, shivered into fragments. Everything denoted that this room had been the scene of a terrible struggle.

The keyhole of the door which led into the cellar was sewn up with cobwebs. The cellar itself was full of dust and debris. Each of us had a lantern, and each inspected for himself. Running along the side-wall, I detected a wire, and following this I found that it disappeared in an old barrel. Without disturbing the wire, I removed the head of the barrel, and found that the wire was attached to an old saucepan lid. A thorough examination revealed nothing further; so we returned to the sitting-room. I did not tell my companion what I had seen, and he had discovered nothing. We did not go up-stairs, because we thought it would be prudent to postpone further explorations until the next day. Meantime, we darkened our lanterns and deposited them in a corner. The room was semi-dark. Our eyes and ears were on the alert; but the house was as still as a tomb; we saw nothing, and heard no sound.

I had merely told my companion that I expected to make an important discovery. Of its nature he knew nothing.

We waited in the most acute degree of expectation and attention until nearly midnight. All of a sudden I heard faint notes of music, which lasted for a few minutes. By-and-by the music was accompanied by a voice. The sounds were

as fine and soft as the voice of a child. I was satisfied that the music was the work of human hands and the voice a human voice; but I was considerably startled. My companion looked very pale, and strove to rise from the place where he sat. I put my hand on his arm to prevent him. It was scarcely necessary, for he could barely muster strength to whisper, 'Let's get.' The music was trailing away into feebleness, when the staircase door began to open and shut. I felt sure that the wire which I had seen down stairs had something to do with this. I made a great effort to rise. To my astonishment, I could not move a limb. I could only bend forward and gasp. A power which I could not resist made me motionless and speechless. Yet all the time I was burning to 'go' for that door, but I hadn't physical capacity to do so.

My companion recovered first, and seizing both lanterns, dashed from the house and made for the roadway. I jumped to my feet and followed my companion. As I did so, I heard a tunk, tunk, tunk! down in the cellar.

I found my mate in the highway, his face as white as a sheet.

'What in thunder ails you, man?' I asked, feeling that the most creditable way of drawing my companion's attention from my condition was to heighten the absurdity of his.

'The ghost!' he gasped. 'I wouldn't go back to that house to save my life.'

There was nothing for it but to tell Webber what I'd seen and what I suspected. As I have said, my fellow-detective was as brave a man as ever took up a trail; and when I told him what I had seen, he became perfectly self-possessed. We spent the remainder of the night in laying our plans. In the early morning he rode back to San Francisco to get the necessary apparatus for carrying them out. I remained to 'shadow' the house.

Just as it was getting dusk, my companion returned, and we re-entered the house from the rear, noiselessly and with great caution. Removing my shoes, I made my way up-stairs, where I fancied I detected a slight noise overhead. There was no sign of this room having been inhabited. The old place was two stories high, with a garret at the top. The garret was evidently reached by a ladder, though none was visible. I surmised that the ghost was in this garret, and that any one showing his head above the scuttle would get it rapped, even if he didn't get shot. There was a large cupboard facing the entrance to the garret, and in the door of it I bored—on a level with my eyes—a few small holes with a gimlet which I happened to have in my pocket-knife, first drawing it through my hair, to prevent its making the slightest noise. My plan was to play the ghost for the benefit of the occupant of the garret—ghost or no ghost. For this purpose Webber had brought with him an old fiddle. I removed all the strings except one, told my companion to allow me time to secrete myself above, and then to make a noise on that one string, accompanying it with a few groans and other muffled noises.

I hadn't been hid many minutes before I heard the darnedest row from below. It wasn't like anything earthly. At first it seemed like one shrieking in pain, then it sounded like bellige-

rent cats, and then it died away in a few complaining sighs. It was so weird that, although I knew very well that my mate was causing it, I couldn't help feeling a bit queer. Pretty soon I heard a movement overhead: the scuttle-top was being removed. Next a ladder was thrust down the scuttle. To help Webber to keep up the entertainment, I gave a few groans inside the cupboard. That brought a man down the ladder. He'd no sooner reached the foot of it than he collared him. It was Coffin.

The moment I touched him he sank down on the floor like—an empty sack. He seemed as if he hadn't got a bone in his body: he was as limp as a jelly-fish. Whilst I got him out into the open air, Webber searched the garret, and found all the missing dollars, bonds, &c.

We hurried Coffin back to San Francisco, intending to lock him up. He was still unconscious, and we were obliged to summon a doctor. Poor fellow! he never got over it. When he came out of his swoon, he was mad, and had to spend the rest of his days in an asylum. That's the effect it has, sir, when a man really believes he has come in contact with the supernatural, as Coffin did.

RECENT SALES OF POSTAGE STAMPS.

Most middle-aged people will remember the craze for collecting used postage stamps which about the year 1861 seemed to possess every grade of society; but perhaps few are aware how, after the mania subsided, a select few still continued the pursuit, and developed what had been the wild fancy of a moment into the science of Philately. That the collecting of postage stamps deserves the name of science will be denied by many. Yet, if careful and minute observation, research, dexterity, taste, judgment, and patience are sufficient to lift a pursuit from a hobby to a science, then assuredly Philately is a science. Eminent lawyers, physicians, men of letters, and even statesmen are now numbered among enthusiastic stamp collectors; and there are three collections in existence—that of Mr T. K. Tapling, M.P., Herr von Ferrary, and Baron Arthur de Rothschild, which are worth in the aggregate more than one hundred thousand pounds. This latter fact will ensure the respect of many persons who would deny it to any pursuit in which considerable sums of money were not involved.

Postage-stamp collecting of necessity lacks age, as the first postage stamp was issued in 1840, and of course it was impossible to collect what did not exist. England had the honour of issuing the first stamp, which was in value one penny, and in colour black. These stamps are still common; a used specimen can be purchased of any dealer for a penny, and an unused one for a shilling. Mr Martin Wears, who has devoted some attention to the history of stamps and stamp-collecting, is of opinion that the mania, as it was then called, began soon after the issue of postage stamps. Punch even thought it necessary to ridicule those who devoted themselves to the pursuit. But ridicule seems to have utterly failed in arresting the progress of the stamp hobby, which by fits and starts continued to exhibit

new admirers until 1861, when the fashion received a marked impetus, or, to use an expressive Americanism, the big 'Stamp Boom' took place. After the general excitement had subsided, those who remained in the depleted ranks of collectors set to work to study the subject in a scientific manner; and it was then that attention was paid to the many varieties of paper, perforation, watermark, printing, and colour which stamps present. Many of these varieties are very minute; and the presence or absence of a watermark, the difference between stamps imperforated, rouletted, *perforé en sautoir*, *perforé en serpentine*, &c., often makes the difference of several shillings and sometimes of several pounds in the value of stamps.

Almost every description of paper known has been used at one time or another to print stamps, and minor varieties are infinite in printing and colour. To give one example: the familiar penny red stamp which was in use in England from 1864 to 1880 boasts one hundred and fifty distinct though minor varieties. It will be seen by this that to have a good knowledge of stamps requires some application, and to those who have a fancy for the pursuit it affords boundless occupation and amusement. In the year 1872 was held the first public sale of stamps by auction. The well-known firm of Messrs Sotheby, Wilkinson, & Hodge conducted the sale; and the rooms where some of the finest collections of books and coins in the world had been dispersed, opened their doors to the despised postage stamp. Some of the prices realised were very good for the time, although the value of really rare stamps now makes them appear extremely small. In quoting the few lots which follow, the probable sum which the same stamp would now realise may prove interesting:

Lots 15, 16, 17, and 18, eight stamps of St Louis, being every known variety, all very rare, brought £19, 12s. (These would now be worth considerably more than £100.)—Lot 49, Jefferson Market Post-office, pink, unique (this is a local stamp of the United States), £5.—Lot 109 (another unique local) fetched £7, 15s.—Lot 124, Bolivia 5 c., violet, £1, 3s. (Now worth about the same.)—Lot 125, Bolivia 10 c., brown, 17s. (It is curious that in the recent sale of postage stamps, Nov. 24, 1888, a similar stamp realised exactly the same money.)—Lot 147, Mexico 1867, thin paper, set of four stamps, £1, 9s. (These would now be worth only 4s.)—Lot 156, set of four New South Wales, view of Sydney, unused, £3, 3s. (Now worth £10.)—Lot 159, Sandwich Isles, first issue, 13 cents, very fine specimen, £6, 10s. (Now worth about £85.)

The sale, however, was considered a very satisfactory one at the time; and it is strange that—as far as we are aware—the next sale should have taken place only after such an exceedingly long interval as sixteen years. Still, we are unable to trace one between 1872 and 1888 in England, although New York has long had periodical auctions, and one gentleman recently held his seventeenth consecutive sale. The recent sale was arranged by Mr Douglas Garth, Secretary to the London Philatelic Society, who, in the interest of collectors, very kindly undertook a work which must have given him a great deal of trouble. It is, however, that this first sale—for the year 1872 has passed into history—would prove

the forerunner of a long series, seems likely to be realised, as the auctioneer, Mr Thomas Bull, has since held several. Three hundred and ten lots were sold on November 24, 1888, and the prices show that there is still plenty of money among stamp collectors. Lot 18, an envelope stamp of Mauritius, 1s., yellow, very rare, but cut round, and therefore virtually spoilt, £3, 15s.—Lot 48, Afghan, 1871 issue, 8 annas, unused, £6.—Lot 76, Brazil, 1844 issue, 600 reis, £1, 10s.—Lot 77, British Columbia, 1869, 10 cents, very rare, £1, 3s.—Lot 83, British Guiana, 1850, 12 cents, £5.—Lot 84, British Guiana, better specimen, £5, 10s.—Lot 94, Bulgaria, 1886 issue, error of colour, 5 stot, rose, £2, 5s.—Lot 103, Cape of Good Hope, 1861, error of colour, torn and mended, £15.—Lot 137, Great Britain, 1840, 1d., black, with V.R. in corners, an official stamp, never issued to the public, £5, 15s.—Lot 186, Mauritius, 1848 issue, pair of 1d. stamps, £4, 5s.—Lot 205, New Brunswick, 1857, 1s., very fine, £5.—Lot 297, Trinidad local stamp, 1847, £13, 13s.—Lot 298, Tuscany, 1860, 3 lire, yellow, £12, 12s.

When we find men remarkable for capacity in law, in physic, and in business giving fifteen pounds for a piece of soiled and torn paper, it seems probable there must be more in stamp-collecting than a cursory glance would lead one to believe. Before concluding, it may be well to remark that all the prices quoted above are for stamps of exceptional rarity, and that common stamps are of little value. A collection of one thousand different stamps in good condition can be purchased for one pound.

SWALLOWS.

THE swallows fly high, the swallows fly low,
And summer winds come, and summer days go;
They are building nests 'neath the cottage eaves;
They dream not of autumn or fading leaves.
The soft showers are falling, the west winds blow,
The swallows fly high, the swallows fly low.

But summer is passing, and golden sheaves
Are whispering of winter and withered leaves;
The woodlands are ringing the whole day long;
The swallows are singing their farewell song;
They sing of a land where they long to be,
Of endless summers far over the sea.

O sunshine! O swallows! Sweet summer-time,
Ye sing to my heart of youth's golden prime—
And distance and death, and long years between,
Recede with their joys and their sorrows keen;
And tender eyes lingeringly rest on me—
Loved eyes, that on earth I shall no more see.

For spring brings the swallows to last year's nest,
And world-weary hearts wander home to rest.
No home like the old of sunshine and dew;
No faces so dear and no heart so true!
Whenever, wherever my feet may roam,
My heart turns with love to my childhood's home.

DOMESTIC NEST-BUILDING.

A BEAVER in captivity will build a dam across the kitchen, making it of sticks and brushes with the most charming air of doing the best he can. The nest-building of the birds has also a delightful air of contrivance about it. One likes them for the marvels they do with bits of grass and rag and wool; and one feels profound respect for the robin that made his nest in a watering-pot, after ascertaining with his bead of an eye that it was a safe one with a hole in it. There is human nest-building too; but considering their resources, the birds are before us in the utility and beauty of their work; while, in contrivance, the beaver in the story leaves us nowhere. Our house-furnishing corresponds to the nest-building of the birds. It is the preparation of our home. Sometimes the work requires no small ingenuity; then we deserve to share the triumph of those feathered nest-builders who do wonders with the most simple materials.

Utility and beauty are to be as guiding-lines in arranging our plan. Let it be remembered that we are not contriving a furniture mart, nor a bric-à-brac shop, nor even a palace on view, but a house to be lived in, every room and part of which is to be made enjoyable. It is greatly a matter of common-sense and good taste; these produce better results than the cheque-book and the complete house-furnisher. The moneyed system results in a mansion complete from a grand piano down to a cat and a duster. The system of contrivance boasts having secured all one likes best and all in good taste. The planners and contrivers are the true nest-builders.

In house-furnishing, it is well that old times are changed and old manners gone. One has to go back a long way to find beauty and utility combined in ordinary rooms. Very far back, the rich had their baronial halls, carved oak and stained glass; but if we come down to recent times and to the bulk of the people, the idea of beauty in the house was either false or unthought of. Who does not remember prim old-fashioned

households, where the notion prevailed—and alas! perhaps prevails still—that the best room was a sacred apartment only to be opened for visits and on Sundays? In that prehistoric period, the genteel drawing-room was a chamber of horrors. On the threshold, one was met by an odour of carpet and cold chimney, and a mouldy suggestion of dead roses in a jar. Windows glared through white curtains that could have stood up manfully by themselves—stiff enough to cut the children's fingers with their edges. A centre table occupied the best bit of the floor. A sort of Druidic circle of books lay upon it, displayed for the sake of their covers, and piled at equal distances; and the covers might as well have been there without the leaves for any use that was ever made of them. In the middle of this charmed circle of books not to be read, stood an object dreaded by the household and avoided as a danger—only some fruit, shocking to the appetite, covered by a glass shade, supposed to be of fabulous value and anxious to crack. The chief ornaments of the room were likewise dangerous and to be shunned, as they wore glass ringlets round their heads—a custom suitable to the taste of the time, but neither useful nor beautiful. In fact the gilded and misshapen 'ornaments' of that period were not to be compared with the shells on a cottage hob. The unused drawing-room was completed by a white or spotted paper, a carpet where even the flowers grew in spots and lines, and a regiment of chairs in uniform—perhaps wearing regulation pinafores to save their uniforms. The only flowers were of wax, paper, or—spare us, O memory!—feathers with quills in them. The occasional table may have been so called because it stood up only occasionally, and at other times stretched its one leg and hid its papier-mâché face upon the floor.

Well, we have changed all that; but, some modern drawing-rooms are hardly more useful. There are rooms so crowded with treacherous stands and brittle trifles, that ladies enter steering nervously; and men lured in against their will are surprised to find a safe seat, and dispose of

their legs with relief and thankfulness. If you shun the milkmaid's stool, you may set the gold screen swaying; if you retreat from the tripod of fern, you may back into the mock-ensel; and ten to one the easel will floor the gipsy table with the photographs, and the table will slaughter the wicker-work-and-palm-leaf stand with the invaluable china perched on it. There is a story told of a perfect hostess who merely rang the bell beside her and continued the conversation when the leg of a guest had tipped over the tea-table and massacred all her china at her feet. But what the guest felt, history does not relate; perhaps, like Artemus Ward, he girded up his 'lions' and fled the scene.

A man prefers a broad floor, a sense of space, seats varied, restful, and strong, his favourite pictures, some of his favourite books, some attention to his favourite ideas of art and beauty. Beside this, he has a certain mysterious pleasure in seeing feminine taste excel his expectations. He is proud of the vision of the artistic effect which women create as by magic out of simple things. Taste can buy beauty in these days almost for a song. The well-chosen colouring of paper and paint-work are half the battle won; the margin of polished floor or of crisp cool matting is a great advantage; used in moderation the brilliance of glistening china has its worth; art enamels give the energetic housewife a means of turning old furniture and colourless brackets and shelves into resplendent ornaments. Shops of foreign goods sell almost for nothing the lacquered gold of Benares, the art colours of India, the glowing pottery of Japan, perfect in shape and hue, and the quaint porcelain of China. At a moderate outlay the 'withdrawing-room' becomes worth its name, beautiful and enjoyable.

There was an old tradition that the family should be solemnly fed among crimson and mahogany. The gloomy dining-room and the heavy dinner are fading away together. Does not half the charm of a picnic lie in its bright surroundings? If a crust on the hillside tastes well, why not dine in a cheerful room—with warm colour and warm firelight, of course, for the winter, but with a glimpse of green outside for the summer, and a picture of the green moor or the misty mountain where one fain would take the bit and sup instead?

The old plain hall and dull staircase have now given place to a pictured hall, even in very simple houses, luxurious curtains for the doors in winter, stairs before all things bright and gay with artistic colour, landings ornamented with glowing jars, green plants, tinted windows.

The use of colour has indeed wonderfully developed in the last few years. People who know its value, design their rooms in contrasts or in harmonies. One of the leading artists delights in painting incidents set in a drawing-room background of yellow and cream and

golden brown. Even up in the sleeping-rooms we may take a hint from this fancy for colour. The blue room and the pink room have still a country-house sound charming to modern ears; but in these days the new varieties of old colours are enchanting. The knack of enlarging small bedrooms has also been discovered. A large plate of looking-glass is let unframed into one of the light-papered walls, to reflect the room, and to serve better than the common bulky mirror. Then the furniture is enamelled ivory white; for it may be noted here that the effect of white is always to enlarge.

Probably there is a nook in the house devoted to books, with sometimes a suspicion of smoke in the air, and a tendency to break out all over in papers. This room is sacred to the lord and master, and none but the wife or daughter can venture to put it in order. In the judgment of the owner, a housemaid would produce a hurricane and leave a desert behind her. If smoke is expected, the floor should have rugs over a hard covering—not matting. Where there are home-made book-shelves, a border, almost as good as leather edging, can be formed of American cloth divided into two-inch strips, and with the lower edges cut into half-circles shaped with a coin and carefully pinked. The ornamentation of the room must be guided by the man's taste, and so abundant as to remove all sense of a plain or dismal sanctum. Some men enjoy a piece of armour, a copy of a Greek vase, or an old blunderbuss, more than their wives would enjoy the pick of the china shops. Others are of the poet Longfellow's mind, and have the dearest of all faces gazing down at them from a picture on the wall.

Most houses have for at least some time another sanctum better still, with white boards and safely guarded windows and fireplace. The nursery must be 'pretty' from the children's point of view. There must be softness and bright colours in the rugs the little one loves to roll upon; something attractive and within a child's knowledge pictured in all directions, but not closely or in a crowded confusion. There must be space to make what the maids dread as a 'strew'—a fine large comfortable 'strew' for a wet day. Above all with whiteness, brightness, toys, and plants, the day-nursery ought to be the most cheerful room in the house. This is the right place for a bird-cage to become part of the furniture, unless the children have already the much-enduring kitten.

The nursery is like the Paradiso; now—down to the Inferno. A kitchen opening on a garden is a treasure in a house; but not every house has got it. However, with neatness and brightness in this region no house can dispense. It should be planned to be like a cottage. An ugly kitchen is a bad one; and a bad one means discontented servants; and discontented servants mean an unpleasant house. The maids take a pride in their shining utensils, as you do in your vases. A simple picture or two, a glimpse of snowy muslin to the window, white tables, the workbox, the chair in a cosy corner, and the ticking clock—all these make up the down-stairs cottage.

This brings us to the end of this domestic

nest-building. Our hints resolve themselves into two principles: arrange the house not by rule or custom, but for the use of each room; and let beauty unite with use in every part.

JOHN VALE'S GUARDIAN.

CHAPTER XX.

WHEN the enemy had retired, Madame swept about the room in triumph, talking vehemently the while. Oho! that Mr Snelling of whom they had heard so much! Well, my friends, we have beheld him, and what did we think of him? That for him! Madame with great deliberation set the tip of her thumb-nail behind her white front teeth and snatched it away with a click.

'That for him, to be sure!' cried Isaiah, and snapped his fingers in derision. It was noticeable, however, that Isaiah went suddenly solemn after this demonstration. Madame walked about declaiming, and he listened, with no air of conviction. 'I tell you what it is, mum,' said he after a while; 'we've acted for the best; but if my opinion goes for anything, the gaffer's got us in the pot, and can put the lid on at any minute.'

'What do you mean?' Madame asked scornfully.

'I mean, mum,' Isaiah answered, 'that if Robert Snelling likes to try to do it, he can ruin the lot on us. I know him, mind you. He says he'll win if he spends a thousand pounds.'

'That for his thousand pounds!' Madame answered valiantly, with a repetition of her former gesture.

'That's all very well, mum,' replied Isaiah; 'and I'm no more for giving in than you are. But there's wit in wood-choppin', and reason in the roastin' of eggs, and we've got to look things in the face, mum.'

'Very well,' said Madame cheerfully. She dropped into an armchair, and set her plump hands upon her knees. 'Now then—look them in the face. What do you see?'

'I see, to begin with,' Isaiah responded, 'that we can't keep the lad away from him. The law's on his side. Master John's father willed him into Snelling's care along with the property. It's a chancy thing to meddle with the law.'

'Are you so much a coward,' Madame demanded with flashing eyes and kindling colour, 'that you counsel to give back the poor innocent to this monster?'

'It'll matter very little what I counsel,' said Isaiah, scratching his head viciously. 'He'll have him back, and nothing we can do can hinder him.'

'That is so,' said Jousserau from his corner. 'But look, my good sir, if— No; I cannot exprime my thoughts in English.' He flashed round upon Madame: 'Look you, dear friend. This man can do what he will. He has the law on his side. Even if we should uproot ourselves and become vagabonds, he can trace us.'

'What?' cried Madame wrathfully. 'You also?'

'Listen! The monster does not want the child at all, unless it is that he should do him a mischief. And yet it is his right to have him, and his duty.—Now listen, I beseech you. Let him have the child, since no better can be done; but,

let us warn him: "You shall be held responsible for whatsoever happens to the boy."—Vigne can find employment at Castle-Barfield. He is a sound good workman, and will be welcome anywhere. We will go and live there. We will stand over yon monster in constant terror. We will defy him: "Lay a hand upon the boy, do a thing to hurt him, and we will rouse the land against you." If you ask me what I advise, it is, that we see this brutal giant without a day's delay; that we tell him to his face: "You shall have what you want, you Snelling, but, at your peril, you shall do your duty."'

The little man rose to his feet, and gesticulated against the imaginary Snelling with such ferocity that Isaiah felt his blood run cold. He had never reconciled himself to the southern vehemences, and found it hard to believe that so explosive an energy could find a vent in mere words. He was persuaded that in his calmer moments Jousserau would not hurt a fly; but whenever the small man and his *plays* got into an animated discussion, he half anticipated murder. Especially at the dinner-table he dreaded controversy, for there the two bosom-friends flourished their knives and forks against each other with such passionate demonstration of apparent hostility, that he had a round score of times risen to intervene between them; and though he had been laughed at for his pains, and though Madame had assured him that these seemingly bloodthirsty antics were compatible with the tenderest affection, Isaiah had always had his doubts about it. He shook his slow-going midland British head at Jousserau's present attitude.

'No, no!' he said decisively; 'no threats, no bloodshed. I'm a law-abiding man.'

Madame, half laughing and half impatient, turned upon him to explain. She laid Jousserau's scheme before him, and in the very act of telling it, her— it caught fire at it.

'There's something in it,' said Isaiah.

'Something?' cried Madame. 'It is the only thing.—Look, Mr Vintare: in Castle-Barfield there is the greatest of all the houses that make decorative glass in England. My husband has been offered work there; and only that that end of the town is so black and dirty, and the sky there always so dark, he would have gone long ago, because the pay is better. Mr Jousserau is leaving us; we have been obliged to send away that wicked Mr Orme—he has his week's notice now—the children are away, the house will be lonely. In Castle-Barfield there are two or three hundred of our fellow-countrymen. There is a French colony there. We shall be within two or three miles of the child, and we can watch over him. The surrender will be no surrender. I wish now that we had not troubled to send the boys to Oxford.'

'There's something in it,' Isaiah repeated. His intelligence was of a slower order than that of Madame or Jousserau. He was not accustomed to allow himself to be persuaded to a new opinion in a moment. 'I shall live about there,' he added, after an interval of reflection. 'I think between us we can defy the gaffer to hurt the lad. He dar' not do it in the face of what we know.'

They talked eagerly for an hour or more, devising all manner of schemes for the defence of

young John against his guardian, until at last Isaiah gave his knee a resounding slap and broke out: 'I've got it!'

'What have you got?' Madame asked him.

'It's all right, mum,' Isaiah answered. 'I've got it! The lad's as safe with the gaffer as Daniel was i' the den o' lions. Leave it to me; I've got it.'

Madame was naturally curious; but Isaiah declined to say a word in elucidation of his project. He nodded and winked repeatedly, and once or twice his inexpressive features creased with a smile of successful cunning. When he took leave of his hostess, he shook hands with unusual warmth, and drawing her towards him, whispered: 'I've got it; it's as good as done for,' and so disappeared, bearing his secret with him. Riding homewards in the slow local Sunday train, he repeatedly hugged his knees and clucked, and his scheme so inflated him that he altogether forgot the troubles his own championship of the runaway boys had brought him.

Arrived at Castle-Barfield, he walked sturdily off to the house of Farmer Gregg. It was the farmer's habit to honour the Sabbath by eating an unusually solid mid-day dinner and going to bed after it; and when Isaiah arrived, he was informed by the serving-maid that the master was asleep, and must on no account be disturbed.

'Fetch him down,' said Isaiah; 'I've got news for him.'

'I didn't wake him for my life,' said the girl.

'Fetch him down,' repeated Isaiah. 'It ain't every day of his life he gets news of a runaway on'y son that's been away a twel'month.'

'Oh, be gracious!' said the maid, 'have they found Master William?' and Isaiah responding by the woodenest of nods, she scuttered violently up-stairs and fell to hammering at her master's door.

The farmer came down, angry-complexioned and short of breath, his eyes yet half sealed with sleep, and his iron-gray hair raying from his head in a hundred different directions. The maid, who was of an emotional turn, was weeping and beating her hands together over the unexpected news.

'What's it all about?' cried the farmer.—'Here, somebody, send this calf to the cowshed. Let a man hear his ears.—What's it all about?'

'I've brought you news o' William, Mr Gregg,' said Isaiah smoothly.

'You have, have you?' the bereaved father answered. 'It's time somebody did. Wheer is he?'

'He's at Hoxford,' returned Isaiah, with a careful aspirate in deference to the reputation of that seat of learning. 'He's, well and hearty, and being took good care on.'

'That's a blessin',' returned the farmer, taking down his pipe from the mantel-piece. 'Is he a-comin' back again?'

'Well, that's as may be,' Isaiah replied. 'I reckon it depends a bit on whether he'd be welcome or no.'

'I'll muck ready for him,' said the farmer. 'Theer's summat i' pickle as ought to be pretty ripe by this time.'

'I say,' said Isaiah, 'do you know what he run away for?'

'Yis,' replied the tender parent. 'He was too proud-stomached to tek a hiding from his own feyther.'

'Not he,' said Isaiah. 'I'll tell thee all about it.'

He was diplomatist enough in telling his story to avoid for the time being the mention of his own part in it. The farmer stared at him, open-mouthed and open-eyed, and in the extremity of his astonishment, dropped his pipe. It broke into fragments at his feet, and he stared from Isaiah to the pieces and back again without so much as an exclamation.

'It was thy Will's pluck an' good sense,' said Isaiah, 'as saved the lad.' He was developing traits of cunning not expected even by himself, and was full of admiration for his own wiliness. 'You remember what poor young John was like before he run away?'—The farmer nodded, staring with wondering, indignant eyes.—'Well, now,' said Isaiah, 'he's as bright as a new-scoured kettle. He's that cliver of his head and his fingers it's a wonder. It's all thy Will's doin'; and I tell thee, thee's got a right to be proud of him.'

The farmer offered no reply to this, but clapping both hands to his mouth, bellowed for his boots. They were brought to him, and he pulled them on, turning purple in the face.

'Now,' he said, 'I'm goin' to pick the heaviest ridin'-crop theer is about the house; and if thee'dst like to see a bit o' sport, thou'rt welcome.'

'What are you going to do?' cried Isaiah.

'Do?' cried the farmer. 'What do you think I'm going to do? I'm going to hide Bob Snelling.'

'Not of a Sunday, gaffer,' cried Isaiah persuasively. 'Leave it for to-morrow. It ain't a work o' necessity—it's a work o' pleasure.'

'It won't keep, Isaiah,' said the farmer; 'it won't keep, lad.'

'Bless you, yes,' urged Isaiah, 'and be the better for it.'

To give an unlooked-for piquancy to the discussion, Snelling's great form loomed in the doorway at this moment.

'Afternoon, neighbour,' he said, perceiving Gregg.

'You come in handy,' his neighbour responded, and began to look about him with a threatening eye.

'I've got news for you,' said Snelling, advancing into the room.

'Hast?' cried the other. 'I've got news for thee.'—Isaiah placed himself between them.—'Let me get at him?' the angry man stammered. 'Let me get at him! I'll flog the coat off his back.'

'Oh!' said Snelling calmly, balancing his riding-whip in his strong hand. 'This is my discharged servant been spreading lies about me. That's the man I sacked this morning, and he comes here, a-poisoning my repitation. You believe him agen the word of a man you've known all your life, a fellow as goes sneaking round, lying behind his old master's back.'

'Look here, Bob Snelling,' said Isaiah, shaking a denouncing forefinger at him; 'I've spoke behind your back, and I'll speak before your face.'

'Don't call me Bob Snelling,' returned his late employer sternly.

'I wouldn't,' said Isaiah, 'if I could find anything worse than your own name to call you by. You want to know what I've been saying behind your back? It's what I said afore your face this morning, and what I'll say afore your face again. John Vale trusted you with his boy, and trusted you with the boy's land. You tried to rob the lad of his land, and what's more, you tried to rob him of his brains. You've got the law of us, but we've got the whip-hand of you. The lad's coming back; but you've got to take good care of him this time. Raise a finger on him, and I'll rouse the parish.'

Snelling turned white, but he held his ground. 'The man's a spiteful madman,' he made answer. 'I won't demean myself by talking about such rubbish. My neighbours know me, and I can trust 'em.—As for you, Isaiah, you shall pay for this.'

'Thee shalt pay,' cried Gregg. 'I'll take the lad's word agen thee, any minute. I was comin' straight to gie thee a welkin', Bob.—Oh! it's no secret. Be'est welcome to the news. I'll know the rights o' things. I'll wait till my lad comes home.'

'As for a hidin', Mr Gregg,' said Snelling, with a rude slow dignity, 'it doesn't become a man o' my years and inches to brag before a man o' yours. I should be loth to hurt you; but about that I'll say no more. If you're so blind you can't see where this chap's spite comes in, I'm sorry for you, and that's my last word.'

'It ain't mine,' said Isaiah. 'I'm your discharged servant, right enough. But what did you sack me for? I served you faithful, as I served your father afore you. I never was slothful i' business, nor wrong by a penny. I know my work, and you can tek on a better man when you can find him. You sacked me, gaffer, when you found I knew the truth about you; and afore we part, I'll tell you one thing for your comfort. You called the lad a idiot in my hearing yesterday. He was that or pretty near it a year ago. But we know the difference now. There's no cliverer or brighter lad for fifty mile round, and that's what a twel'month away from your clutches has done for him. Now tek him back agen, and let me see a sign that you're frightening him back into what he used to be, and then I'll show you something. As big men as Bob Snelling have seen the inside of a lock-up afore to-day.'

'Was it my fault,' Snelling answered, 'as that young brute threw a stone at my nephew two years ago? Is it any wonder that the lad's got better? If he has, is there anybody as has got such a right to be pleased at it as I have? Let the lad come home again. Let the parish see how he's treated. When your own lad ran away with him, was that my doing? It was him as tempted John away; and he started, if all tales be true, because you thrashed him. I'll talk no more about it. Change your mind about floggin' me, farmer, and so good-bye to the pair o' ye.'

He walked home, proud enough to look at, but feeling altogether foiled and broken. He raged bitterly against the suspicions which surrounded him, and appealed to his own part for a defence against the opinion of his neighbours. What right had any man to believe this shameful

charge? The mere right of truth was nothing to him, for they could only suspect. It was nothing that their suspicions were well founded. He alone could know that.

The boy was coming back again, and watched as he would be, he must needs treat him kindly. The black and dreadful phantom hidden in his mind took a forward step or two, and seemed to whisper, 'You will have need of me.' As yet, he dared not look it in the face; but he learned to own to his own soul that the awful thing was there.

DERELICT SHIPS.

A DERELICT or abandoned ship drifting hither and thither before boisterous breezes and constant currents is a truly pitiable sight to a seafarer at any time. Such vessels, moreover, are as dangerous to ships that may chance to cross their erratic course as ever uncharted rock heaved up by volcanic action from hitherto presumably fathomless depths of old ocean. Some are seen wholly dismantled, their severed spars crashing like battering-rams against their wounded sides; others with masts still standing, but sails blown into shreds, that flap against the swaying yards in savage unison, while the wind wails a shrill accompaniment across the chafing cordage. Rudderless, with seams gaping wide, these deserted hulls await the final breaking-up that sooner or later comes to all. White-capped waves, raised by the cyclone's fury, make a clean breach over the forsaken ones as they wallow in the trough of the sea, and play sad havoc with the upper works, until at length the riven fabrics fall asunder. Abandoned vessels, however, are sometimes so strongly constructed as almost to defy the war of the elements; and none but navigators are aware how many months such floating wrecks remain intact to drift about the ocean to the great danger of ships on their voyages. Derelicts have probably proved fatal to many a good ship that has left the land to disappear as utterly as though she had never been. Ships floating keel uppermost are a great menace to navigation, as nothing but a curl of foam indicates the danger to a mariner, be he ever so watchful. The North Atlantic is strewn with deserted vessels after every hurricane. There is a greater traffic on this expanse of water than on any other ocean; and the timber-ships trading to North America are both old and numerous. Worn-out timber-laden ships unfit for any other trade form a large majority of the drifting derelicts.

It would seem that ships are more frequently abandoned than formerly; but no reliable comparison can be made, inasmuch as the ratio between the number of ships left derelict and the total number afloat in any given period is only available for recent years. There was an ancient axiom that freight was the mother of wages. If a ship were abandoned, her freight was lost; and consequently, wages could not be claimed by the distressed seamen on arrival in port without their ship. Then, as now, it was the uniform practice to insure ship, cargo, and freight from any part of the world. Should the ship be cast away, every one having an interest in the property has a legal right to be indemnified to the full extent which his insurance covers. The seaman who lost his clothes and barely escaped with his life was in

olden times held to forfeit his wages, which were not legally insurable.

The reasons urged by eminent jurists in justification of this anomaly were peculiarly plausible and self-satisfying. When a man is well aware that the abandonment of his vessel would leave him penniless, as by this act he voluntarily forfeited all claim to remuneration for services rendered, and that, on the other hand, by remaining on board his disabled ship he ensured certainty of pay, although at the end of a protracted voyage, the mariner would be more chary of deserting his ship. Seamen, however, as a rule are loth to leave their ship, and practical men have succeeded in partially removing this disability. The law was modified so that a ship's crew are entitled to payment of wages up to the date of her loss; and it has been proposed that pay should not cease until the arrival of the breadwinner at home, provided he make no unnecessary delay in his return. This is but fair; for the ship-owner who has insured both ship and freight is in just the same position, should she be totally lost, as though his ship had made an average passage home without having to pay a crew for navigating her. It may be objected to this that the dread of loss of wages being banished will lead to greater freeness in abandonment; for when a steamer heaves in sight proffering an asylum to tempest-tossed mariners in a ship as leaky as a sieve, it is ten to one that they will cease pumping and betake themselves to the boats. Then the officers must perforce follow, as to remain would be suicidal. Moreover, the master is probably influenced somewhat by the knowledge that his employer is well covered by insurance; and the competition among underwriters leads to settlements of claims that might otherwise be resisted. Quite recently, a large water-logged derelict was picked up and towed into a United States port. Upon examination, it was discovered that her cargo consisted of worthless timber, and holes had been bored through her sides under the water-line. Her master had entered into a conspiracy with the shipper of the cargo to cast away the ship, with her worthless but heavily insured cargo. He would have succeeded had she gone to pieces, as expected. Her owners were saddled with an expensive lawsuit to recover this ship from her salvors. Happily, this manner of making derelicts is very rare.

Not every vessel deserted by her crew is a derelict in the eyes of the law; in other words, although *de facto* abandoned, a ship may be *de jure* reclaimed by her own crew, even though strangers may have boarded and taken possession in the enforced absence of her crew. We remember a case of a Norwegian ship dropping her anchors in a gale of wind on a lee shore. Master and all hands made for *terra firma* and awaited the issue, intending to return when the wind went down, if the anchors held her. Meanwhile, a tug came along, slipped the vessel's anchors without her master's consent, and towed her to a safe port. Ultimately, the captain recovered his ship by legal process. A ship to become legally derelict must have been abandoned, not only without hope of recovery by her crew, but also without any intention on their part of returning. It is said that if a cat or dog be found on board of a ship, she is not a derelict in the strict sense of the term. The

Norwegian *Familiens Minde* fell in with a Portuguese vessel in mid-Atlantic making signals of distress. Both vessels hove-to, and in a short time the whole of the Portuguese abandoned their ship, declaring her unseaworthy. The crew of the Norwegian vessel found that the stranger might possibly be brought into port; and as her late crew refused to return, the mate and two or three men of the *Familiens Minde* resolved to take the risk. Sail was made on the salvaged ship, and, strange to say, she arrived safely at an English port some days before her salvor. On the arrival of the latter at Gravesend, the Portuguese mate was so affected at the news that he committed suicide. Had not these plucky Norwegians brought the derelict to England, she might have drifted about for months in the track of shipping.

The United States Hydrographic Office awoke to the importance of making known the probable positions of derelicts and other formidable obstructions to navigators in the North Atlantic, and have for some time past published monthly Pilot Charts, setting forth in a simple but precise manner the whereabouts of every shifting danger reported to that department up to the time of going to press. Lieutenant G. L. Dyer, U.S.N., is the present hydrographer, and his carefully collated charts should be in the hands of every shipmaster who crosses the Atlantic. These charts are distributed to navigators without charge; and branch offices have been established at Boston, New York, Philadelphia, Baltimore, New Orleans, and San Francisco, where shipmasters will find all the latest nautical information courteously placed at their disposal by the United States naval authorities. The independent testimony of such charts should be especially valuable to lawyers and others interested in questions relating to collisions with derelicts or icebergs; or to loss or damage in fog or through stress of weather.

Mariners upon water-logged ships in mid-ocean are frequently compelled to endure terrible suffering, sometimes ending in a horrible death. At the commencement of the Victorian half-century, the *Caledonian* encountering the full force of a hurricane, became water-logged and unmanageable. Her crew remained for thirteen days on the wreck, subsisting on the dead bodies of their shipmates. Cabins and provisions were under water. The Russian ship *Dydden* rescued the survivors from their perilous position just as they were about to satisfy the cravings of thirst with the blood of the cabin boy, whom they had resolved to slay. Extraordinary heroism was evinced by the mate of the Russian ship. Single-handed, that brave man rescued the stricken seamen during bad weather in a small boat at the imminent risk of his own life. A ship named the *British Gratitude* was subscribed for by British merchants and presented to that officer, in order that his action might live in the memory of his countrymen.

Five years ago we were seated in the saloon of the *Annie Johnston*, a graceful iron-built barque belonging to San Francisco, U.S., as she lay in one of the Liverpool docks. Commenting upon the fact that America owned very few iron ships, the captain stated that this vessel originally belonged to Liverpool owners, and was then the *Ada Irredale*. She was abandoned in flames, owing to the spontaneous combustion of her coal cargo, on the 15th

of October 1876, in fourteen degrees south latitude, one hundred and eight degrees west longitude, or about nineteen hundred miles from the Marquesas Islands, which her crew reached in open boats, after twenty-five days, with the loss of only one man. The burning derelict drifted westward to Tahiti, a distance of over two thousand four hundred miles, and was towed into port by a French war-ship on the 9th of June 1877, nearly eight months after her abandonment. Her coal cargo continued burning till May 1878, when she was repaired, renamed, and placed under the stars and stripes.

The *Oriflamme* was abandoned under similar circumstances in June 1881, in eighteen degrees south latitude, ninety-three degrees west longitude. Four months later, she was passed about two thousand miles farther westward; and in February 1882, her iron hull drifted ashore on the island of Raroia, one of the Low Archipelago, and was visited by natives, who brought away her bell, on which was engraved '*Oriflamme*, 1865.' She subsequently sank in deep water, after drifting over two thousand eight hundred miles in eight months.

We were in Algoa Bay in 1864, when a large iron ship, apparently not under control, was seen standing in for the anchorage. If we remember rightly, she proved to be a prematurely abandoned vessel, laden with a valuable cargo of jute. Slight repairs were effected, another crew obtained, and she arrived safely home, after having drifted derelict for several months.

As a rule, drifting derelicts are wooden-built vessels, as the oldest iron ships are not yet sufficiently ancient for the timber trade. Sir T. Brassey, in his yacht *Sunbeam*, passed the abandoned *Carolina* when three hundred and fifty miles west of Ushant. She was between two and three hundred tons' burden, her masts snapped short off, and laden with port wine and cork. It was with difficulty that his boat's crew could be restrained from bringing away some of the wine. Barque *Ulster*, abandoned in February 1880, was sighted by many vessels; and about twelve months after she came ashore on the islands to the north of Scotland, where her cargo of timber was salvaged. Barque *Laboramus* was derelict from May to October of the same year, and was finally towed into Vigo. The *Agenor* was passed derelict off the west coast of Ireland in July 1846, and in September off Cape Wrath. She drifted ashore at Hartlepool in December, and forms an interesting example of the set of the waters round the northern shores of Scotland from the Atlantic into the German Ocean.

One of the most remarkable derelicts in the North Atlantic was the schooner *Twenty-one Friends*. She was observed in March 1885, about one hundred and sixty miles from Chesapeake Bay; and four months later was two thousand miles east-north-east of the position where she was abandoned. Thence she drifted towards the north coast of Spain, and was last seen in the vicinity of Cape Finisterre. She had been reported by no fewer than twenty-two vessels at intervals more or less widely separated. How many have to congratulate themselves on unwittingly giving her a wide berth? The Gulf Stream bore her right across the Atlantic in about eight months. Some such ship might easily have given

rise to the old sailors' superstition with respect to the 'Flying Dutchman,' doomed to be continually met with off the Cape of Good Hope. The schooner *Monticco* was abandoned in December 1886, in thirty-nine degrees north latitude, seventy-two degrees west longitude; and was last met with in the following July in twenty-eight degrees north latitude, thirty-five degrees west longitude. The schooner *Ida Francis* was abandoned in seventeen degrees north latitude, sixty-five degrees west longitude, in March 1886, and drifted, by zigzag courses, on to the north shore of the island of Abaco, nearly ten months later. The Barque *Vincenzo Perrotta*, derelict in September 1887, in thirty-six degrees north latitude, fifty-four degrees west longitude, was passed, looking as fresh as ever, on 23d February last, about twenty-three miles from Watling's Island. The American ship *John T. Berry*, bound from Philadelphia to Japan with a cargo of petroleum, caught fire, and was abandoned on 9th January, last year, in thirty-four degrees south latitude, one hundred and sixty-four degrees east longitude; and in June was discovered bottom up about seven miles from Newcastle, N.S.W. Her anchors had fallen out, and held her right in the track of shipping making this antipodean coal-port. A glance at the charts showing the prevailing ocean currents in the vicinity leads us to infer that the burning, or burnt-out, wreck drifted outside of New Zealand, and thence to the Australian coast. The above-mentioned derelicts have happened to get into the large ocean currents, and aided by favourable breezes, have made some remarkable drifts. Other ships that have been left derelict in parts of the ocean where winds and currents are variable and of little strength, have been known to remain almost stationary for months. Barque *Stormy Petrel*, most appropriate name, was abandoned in December 1886, in forty-seven degrees north latitude, ten degrees west longitude, directly in the track of vessels bound to and from Gibraltar. There she remained a menace to mariners for exactly six months, having drifted during the whole period about six degrees to the northward. Barque *Rowland Hill* was drifting in February 1886 in forty-two degrees north latitude, fifty-two degrees west longitude; and in the following November was still close to the same spot.

The *W. L. White*, a wooden, three-mast, timber-laden schooner, built in 1884, has just terminated her remarkable cruise. During the awful American blizzard of 13th March 1888 she was abandoned, water-logged, about eighty miles from New York, U.S. The genial Gulf Stream and westerly winds drifted this derelict right across the Atlantic, and on the 23d of last January she brought up to her trailing anchors on the north-west coast of Scotland, near Hasker Island, one of the rocky Hebrides. From the beginning of May till the end of October she drifted aimlessly about in and out of the Gulf Stream and the Labrador currents, setting north-east and south-west respectively. During this long interval she was reported by no fewer than thirty-six ships, three of which sighted her in one day. In her cruise of ten months and ten days she traversed a distance of more than five thousand miles, was reported forty-five times, and it is impossible to estimate how many more vessels unknowingly

passed her at night and in foggy weather. We are indebted to the admirable charts issued by the Hydrographer of the United States Navy for a complete history of the *W. L. White*. Last January, two large ships collided with derelicts while under full sail, and received serious damage, so that the importance of this subject cannot be over-estimated.

In ancient times, under the Rhodian law, both stranded ship and cargo became the property of the owner of the seashore whereon she had drifted. There were no underwriters or Lloyd's agents in those days. Now, salvors and others interested participate in the profits according to agreement or decision of a law-court.

Derelicts have ere now proved useful to the writer of fiction. Wilkie Collins in *Armadale* has drawn a weird word-picture of a derelict timber ship that makes us shudder as we read. Occasionally, the crew set fire to their ship before quitting her; but this is seldom done, lest evil tongues should assert that she was purposely destroyed for the sake of the insurance. It would, however, be a good thing, on falling in with a derelict in fine weather, if shipmasters would set fire to such a drifting danger. Men-of-war could have good torpedo practice with them, as one had not long since. As we write, the U.S. warship *Yantic* has been ordered to set sail in order to destroy the *Vincenzo Perrotta*, mentioned above.

Those who live at home at ease may wonder how it is that a derelict ship can keep afloat so long; and seeing that they keep afloat, as shown above, why they ever were abandoned. They keep afloat because their cargo happens to be of a buoyant nature, as in the case of timber-laden vessels; and they are abandoned because, even if new ships, once water-logged they are unmanageable, in danger of capsizing, no food can be got at from below, and when heavy weather comes, all hands have to betake themselves to the tops, as the seas break completely over the wrecks, which lie like logs upon the heaving waters. Seamen in derelicts have often had to dive in the cabins for scraps of food. They hold together so long because the ships are stoutly built, though too old in many instances to carry perishable cargoes.

OGILVIE WHITTLECHURCH.

CHAPTER II.

OGILVIE proposed to make his first halt at Queensferry, where, at the time of which we write, that immense and almost superhuman work of engineering, the Forth Bridge, was just being begun. He arrived there about noon. As yet the operations had not advanced beyond the merest preliminaries; but these alone were on so vast a scale, that the imagination recoiled from the task of estimating the amount of time, labour, skill, and capital it would take to bring this gigantic undertaking to a successful termination. A huge iron caisson, destined to form the base of a column, had been completed, and was to be launched that afternoon, and he determined to wait and see the operation.

No one, in good health takes a long country walk without feeling hungry; and Ogilvie, who had been indulging in sharp pedestrian exercise for about three hours in bracing air, was simply

ravenous. His knapsack held a small store of cold provisions, but that was only for emergencies. At present, a little inn, near at hand, seemed to offer the prospect of a much more substantial lunch, and thither accordingly he repaired.

In answer to his inquiries, the landlord informed him that the parlour was engaged, but that whatever he pleased to order could be served him in the taproom.

'No, no!' interposed a young man, who at that moment emerged from behind a glass door leading to the parlour in question, and who had evidently overheard the conversation in the taproom. 'There's lots of room in there, Forward, and this place will be chokeful of workmen in a few minutes. Come in, and let me introduce you to my mother and sister.' The speaker was a young officer of the mercantile marine, named Rimington, whom Ogilvie had often met at Leith, where he had been staying to go through a course of drill, in his capacity of sub-lieutenant in the Royal Naval Reserve, on board the gunboat stationed there.

Gladly accepting his invitation, Ogilvie followed him into the parlour, where he was duly presented to the two ladies. The elder of these, Mrs Rimington, was a widow. Her husband had been lost at sea not many years after they were married, and this, doubtless, had something to do with the subdued and rather sad look which her face so often wore. There was something very kind and winning about the look, notwithstanding its sadness—something that had the effect of making one feel at home in her presence from the very first—that seemed to say to Ogilvie: 'You are my son's friend, so of course you are mine also, and I hope that you will consider me yours.'

Her daughter, Miss Rimington, was a delicately lovely girl of about eighteen summers, of a type of beauty rather Spanish than English. Neither in her manners nor conversation, however, was there discernible the slightest trace of that languid deliberation, sometimes natural to, and sometimes affected by brunettes. On the contrary, she was in every respect like any other pretty healthy English girl of her age. She seemed also to have inherited from her mother the gift of being able to put people at ease in her presence.

'I suppose,' said Mrs Rimington, 'that you are like us, Mr Forward, very nearly leaving the neighbourhood without having seen the Forth Bridge?'

'Oh, well, mother,' put in her son, 'you know they say that there's many a Roman shopkeeper who lives and dies without seeing the Colosseum; and then we have come at last.'

'Are you on a walking tour?' asked Miss Rimington of Ogilvie, as he unstrapped his knapsack.

'Only a very slipshod sort of a one, I am afraid, Miss Rimington,' he replied. 'I shall never walk further than I feel inclined; and if at any time I want to avail myself of the coach, I most certainly shall do so.'

'I was thinking of going for a tramp myself,' said Rimington; 'but I shan't have time.'

'Isn't it a shame, Mr Forward?' said his sister. 'George has only just finished drilling on board that horrid little gunboat, and to-morrow he will have to go to Glasgow to join his ship.'

'It does indeed seem hard,' sighed Mrs Rimington, glancing fondly at her son. 'He hasn't been six weeks in England; and if Mary and I hadn't come up here, we should hardly have seen him at all.'

'Nonsense, mother,' laughed Rimington. 'It's an ill wind that blows nobody good; and if I hadn't been qualifying to serve my Queen and country on board the gunboat, we should have all stayed vegetating down at Whitby, and then you and Mary would never have seen Edinburgh.'

'Do you live at Whitby, Mrs Rimington?' asked Ogilvie. 'My father has just taken a house there, in North Crescent. I hope we are neighbours?'

'In North Crescent! Oh yes, we are neighbours, and very near ones too. We live just at the end of North Crescent, at Rose Cottage. I hope we shall prove good neighbours, and that we shall see you there.'

'Well, I had no idea that you were a Whitbyite, Forward,' said Rimington. 'Why, I believe that the world grows smaller every day. I never thought very much of our planet after my first voyage to Australia; but lately I've positively got to despise it. -- Hullo! here comes lunch at last. Hadn't we better set to work? It would never do to be late for the launch.'

When they went out after lunch, the last preparations were being made round the caisson. Rimington, as became his profession, was chiefly interested in the actual launching arrangements; so was his mother. So, while these two were inspecting sluices and chocks, rollers and tackles, and the rest of the attendant paraphernalia, Ogilvie, as an engineer, was able to explain to Miss Rimington the construction and use of the caisson itself. And so interested and attentive did he find his pupil, that he went on to instruct her in the principles of the 'cantilever' system of bridge-construction, demonstrating its advantages and picking out its weak points most impartially. The conversation, however, was disturbed soon afterwards by the very event which they had come to see—the launch of the caisson. Everything worked perfectly; and in a few minutes, amidst the hurrahs of the workmen, the great machine was quietly floating in the firth, ready to be towed off to its position, and sunk.

Having taken leave of the Rimingtons, who were going back to Edinburgh, Ogilvie crossed the Forth by the ferry-boat, and, pipe in mouth, resumed his tramp. When a man smokes, he meditates; it's a law of nature. If his tobacco be ordinary, his meditations have a tendency to be practical; if good, they are more inclined to be abstract and philosophical. Now, Ogilvie's tobacco was good, and before he had walked a mile, he had satisfactorily established the hypothesis, that the pleasantest people are always those whom one meets unexpectedly; but then he was not thinking of Miller.

CHAPTER III.

'Keep her as she goes, Mr Rimington, and get a small pull of the weather-braces if the wind draws aft. If it draws aft much, you can set studding-sails.'

'Ay, ay, sir,' replied Rimington, second mate

of the *Maharanes* clipper, and who was then on watch.

'But if we only have a little luck, we'll be first ship home; I'd bet a year's pay on it,' said the skipper as he went down to his cabin by the after-hatchway after giving the above directions.

They had just caught the south-east trade, after rounding the Cape, homeward bound from China, with tea and one passenger; and, as the captain had said, it seemed by no means unlikely that they would be the first of that year's tea-ships—not steamers, of course—to take the pilot on board in English waters. But everything depended on crossing the line. If they were lucky enough to get a puff to carry them across the 'Doldrums,' it was a certainty. If not—well, they must hope that the others would suffer the same delay.

Rimington paced the poop, pipe in mouth, occasionally giving a critical glance at the main-royal, and longing to get that little pull of the weather-braces; but each time that he looked, the shaking of the weather-leech told him plainly that nothing must be touched. It was two bells (nine o'clock), and his watch would be over at midnight. But he was not particularly anxious for that. There was no great hardship in pacing the poop and smoking his pipe in the soft moonlight; while the balmy air, set in gentle motion by the southern trade, fanned his cheek and filled the sails; and the ship, just heeling to its tender caress, except for an occasional gurgle under the bows, slipped noiselessly through the water.

Presently he was joined by the passenger, Mr Parkins. The latter was a man with whom things had gone well. He had originally gone out to China to take up a post in the Customs, then, as now, chiefly administered by Europeans. His duties, however, were not so arduous but that he was able to carry on a certain amount of business on his own account. The Flowery Land at that time presented a grand field for an enterprising man; and by unflagging diligence, aided by a few lucky speculations and a natural aptitude for business, he found himself in a few years, and while still quite young, one of the richest tea-merchants in Shanghai. He had resigned his Customs appointment some time ago, and was now going to revisit his native country. He had intended to take a berth on board one of the Peninsular and Oriental Company's splendid steamships; but chancing to light on his old schoolfellow and chum, Rimington, serving on board the *Maharanes*, he had changed his mind and taken passage in her instead.

The two friends continued for some time to walk about in silence; then Parkins said: 'It's a strange chance that has brought us together, old chap. I suppose that if I had been asked, there is no one in the world whom I should have said that I thought I was less likely to meet walking along the jetty at Shanghai than yourself. You never used to talk about going to sea.'

'No; I never had any intention of doing so; in fact, when we knew each other, I don't think we either of us troubled much about professions. On the whole, I'm not sorry that things have turned out as they have. A sailor's life is a hard one; but there are a good many worse; and if you don't stop my heaven-born right to growl

at anything and everything I have to do, I can jog along very happily. Every one can't be a Croesus like you.'

'No; I suppose not. Certainly, I have been very lucky. It would be interesting to know what has happened to all the other Olswick fellows.—By the way, there is one especially I want to speak to you about. Do you remember a little chap called Whittlechurch, who was expelled? Wasn't his Christian name Ogilvie?'

'Yes; it was.—What about him?'

'Well, it's rather a long story, and a very curious one.—Wait a minute till I get a light.'

'Right you are,' said Rimington; 'and meanwhile I'll get the yards in a bit.—Watch, round in! Weather-braces! Come along there; shake up, shake up!'

For a few moments the watch could be seen moving about the deck in obedience to the order, while the blocks creaked and the yards were trimmed. Then all was quiet again.

'Finished, old chap?'

'Yes.—Now, let's have your yarn.'

'Most of my property,' said Parkins, 'as you know, is some way in the interior; and last tea-harvest I went to inspect some improvements which I had had made on one of my estates, up the Chongokiang. I reached the place by a little steam-launch, without any misadventure; but when we started to come back, we found that one of the cylinders was out of order and could not be used. I didn't care to take a passage down in a junk, so there was nothing for it but to wait. The engineer said he should be about three days repairing the damage; and for want of a better way to spend the time, I decided to visit Wangtsing, the capital of the province and the seat of government. I found it the most thoroughly Chinese place that I had ever seen. Not a single mission has managed to build a church there, and I don't suppose that there are half-a-dozen Europeans in the whole place. It so happened that I arrived at a very opportune time: the whole town was *en fête*, and a long procession was being formed to meet and welcome the governor's army, which was returning victorious from an expedition against some pirates, and was expected back that evening. I had heard something about these pirates at Shanghai, and knew that the expedition was the result of several very urgent remonstrances made by the Western ambassadors to the government at Peking; and I was heartily glad to hear that it had been successful.'

'I heard of them too,' said Rimington. 'But I fail to see the connection between a nest of Chinese pirates and our old schoolfellow, Ogilvie Whittlechurch.—What are you doing with the helm down there? Keep her away, man, can't you? Give her the helm! You'll have the ship aback in a minute.—Who is that at the wheel?—Miller?'

'Yes, sir.'

'Let me recommend you to keep your eyes open, then.'

'He's a good enough seaman, as a rule,' explained Rimington; 'but they all go to sleep on a calm night, if you don't look out.—However, to continue your yarn. I had just said that I didn't see what the pirates could possibly

have to do with Ogilvie Whittlechurch, or Ogilvie Whittlechurch with the pirates.'

'Wait a minute, old fellow; I am just coming to it.'

'Well, that evening, sure enough, the army did come back, and with such a beating of drums and waving of banners as you never saw in all your life. A Chinese soldier is a rare hand at that sort of thing, if at nothing else. Then there was a whole wagon-load of heads; and two of the pirates' prisoners whom they had rescued, and who were carried in litters. One of these litters contained an old Chinese merchant who had been captured on board one of his own junks, and who, except for a good fright, was very little the worse for what he had gone through. The other, an Englishman, was Ogilvie Whittlechurch's father.'

'Whew! How did you find out that?'

'From the man's own mouth. The governor sent me a message that a fellow-countryman was dying at the palace, and would like to see me. I found the poor fellow worn down to a shadow with fever, and obviously at his last gasp. He seemed to have something on his mind that he wished to tell me; but it was perfectly awful to listen to him trying to speak while his voice came and went spasmodically—interrupted every minute by terrible fits of coughing. The gist of what he said was this: His name was John Whittlechurch. When he was young, he had been a bad lot—a drunkard, by what I could make out; then he emigrated to America, leaving his wife and her baby in England. For a long time he seems to have got on no better in the new country than he did in the old; but a few years ago he had a stroke of luck at the diggings, and became a millionaire. He then started to come home, westward, to try to find his wife and child; but the ship was wrecked in the China seas, and all who escaped the waves were captured by the pirates. Before leaving America, however, he had taken the precaution to make a will which he left with his solicitors at Sacramento. In it he left everything to his wife, to go to his son Ogilvie at her death. In case neither should be found, everything was left to a certain Pedro Bersaio, who seems to have been a sort of banker at the diggings, and who on this condition had advanced him money to carry on digging his claim.'

'What usury! I suppose the fellow is a thorough scoundrel.'

'I shouldn't wonder—anyway, he seems either to have done fairly well out there, or else to have made the place too hot to hold him; for he has gone to London, so the dying man told me. His present address is "The Californian Club," near Leicester Square.'

'Humph! I'll bet he's a rascal.—But wait half a minute, old chap,' and so saying, he walked to the compass—the ship was two points off her course. This was too much for Rimington's patience, and he told the helmsman so in no very gentle language; threatening, if he had again to find fault with him during the watch, to give him an extra trick to practise in. Having thus given vent to his indignation, he returned to where his friend was standing and resumed the conversation.

'Did he give you no details by which to trace his wife and son?'

'No. I think that he wanted to; but his strength was quite used up in telling me as much as he did, and he died in my arms not an hour after I had come in.'

'But how do you know that the Whittlechurch we were at school with is the man you want?'

'I can't be certain, of course; but Whittlechurch is such an uncommon name, and so is Ogilvie as a Christian name, that I hardly think there can be two. Besides, the age seems about right.'

'Well, there should be no difficulty in finding him. We can trace him from the school. And then, even if he is not the man himself, he must surely be a cousin. I suppose you told the lawyers all you knew?'

'Yes; and they send me a telegram to say that they were employing a detective in London to make inquiries.'

'Well, I wish a relative of mine would die a millionaire and make me his heir.—And now, I think I'll try how the topmost studding-sail stands.—No; I won't, though; it's just eight bells. The other watch can do it when they muster.'

THE LAW OF DISTRESS IN FRANCE.

THE state of agriculture in France was last season very bad, and quite disastrous in the La Rochelle district. According to a Report by Mr Warburton to our own Foreign Office, nothing that Great Britain has suffered can 'compare with the depth of the depression which exists there.' As has been the case in this country, the landlords in France are helping their tenants by allowing time for payment of rents and by making large reductions. That they are right in this is certain; but few persons are aware of the very great powers a landlord in our neighbouring country has by which he can enforce his claims; and that he does not use his 'giant's power' is most creditable.

It appears that every tenant is bound to pay his half-year's rent the day it becomes due. If the tenant holds his farm under a lease or other agreement in writing made before a notary public, and does not pay his rent on the day it falls due, his landlord sends him by a *huissier*, or bailiff, what is called a *commandement*, which is a notice ordering him to pay at once under pain of a seizure. The law gives him twenty-four hours to obey this order, and then, if he has not paid, the bailiff, without any decree or process from a legal court, takes possession of everything in the place, farming-stock, implements, crops, furniture, money, or anything else he may find—all goes to satisfy the claim for rent, to the exclusion of every other debt. From this moment all the property is in charge of the legal authorities, and it is a criminal offence to interfere with it. Next, the bailiff makes an inventory of it, and fixes a day for the sale, which must not be sooner than eight days off, and posts up on the nearest market-place a copy of this inventory, with the notice and date of the sale. In the interval between this and the seizure the landlord is entitled to the use of the farming implements and stock for carrying on the farm-work and the judge is applied to and names a manager to conduct the farming operations for

him. In due time the sale takes place, and the landlord is paid his rent and costs out of the proceeds.

But the tenant's liability does not end here: the law provides that the failure of the tenant to fulfil his part of the contract is a ground for terminating the tenancy, and that, moreover, he is bound to compensate the landlord for the trouble and annoyance he has put him to. The case then comes before the *juge de paix*, who cancels the lease or agreement, and proceeds to consider what loss the owner is likely to suffer from delay and difficulty in reletting his land or other causes, and condemns the tenant to pay damages accordingly. Thus, within a fortnight from the time the rent became due, the owner can have recovered rent, costs, and damages, as well as possession of his property.

It was mentioned that the landlord has a preferential claim on everything there may be at the farm, and can seize it for rent due, and the question which naturally occurs here is, can a dishonest or disorderly tenant successfully evade a seizure? There are two ways in which this is attempted: one is by making away with the property; and the other by resisting and obstructing the officer who carries out the seizure. But the French law makes both processes very difficult. In the first case, it provides that if the landlord has reason to think that his tenant will make use of the twenty-four hours' law given him between the order to pay and the putting in of the execution, to make away with anything, this interval may be suppressed on application to the justice, who thereupon gives an order to seize at once. And if, when this has been done, it appears that the tenant has already removed anything, and placed it in charge of a third party elsewhere, or if he has sold it to him, the judge gives an order to follow it wherever it may be, seize it, and replace it on the farm. If it has been disposed of, even by *bond fide* sale, within forty days previous to the seizure, the sale is invalid, and the article is taken away from the purchaser, who loses his money, and has no remedy except by a civil action against the seller at some future time. Both these orders by the *juge de paix* are what is called 'orders of urgency,' and differ from others inasmuch as they can be executed instantly, and at any time, even on non-legal days, such as Sundays and holidays.

In the second case of resisting or obstructing the officer, if the bailiff is prevented from going into the house or farm, he simply places a person to watch while he goes to the nearest justice, mayor, or *commissaire de police*, who comes down at once, forces an entry, and puts him in possession. If he is assaulted or intimidated, the punishment is very severe, and in an assault case is measured according to the number of persons engaged in it. If no more than three persons are concerned, the law assumes that it may not have been premeditated, and the punishment is six months' imprisonment. Over three and up to twenty, it is more serious, and two years is the term that can be given: this by the Court of Correctional Police, without a jury. But if the number exceeds twenty, it is considered 'rebellion,' and is punishable by *travaux forcés* (penal servitude in the convict settlements); and here the trial is before a jury, with a change of venue

to another part of France if the Minister of Justice thinks that prejudice exists which might affect the impartiality of the jurors in the locality.

In case of other agreements, such as verbal ones, the legal process is the same, except that the landlord, instead of putting in an execution without a special writ or order of court, goes in the first instance to the *juge de paix* for an order to seize. Mr Warburton well says that 'this is how property rights are enforced in this republican country, and it goes a long way towards explaining what is sometimes described as the "craving for land" which exists in France, especially amongst the poorer classes, and why they are always ready to put their hard-earned savings into it at a rate of purchase which often gives them only one and a half or two per cent. interest, as is done by persons in the position of domestic servants, who continue to remain in service and let to a tenant. It is, however, much less a craving for land than for a perfectly safe investment, which, though it may pay badly, they can manage as they think best, and are certain no one will ever be allowed to take from them.'

MY ESCAPE FROM THE JHANSI MASSACRE.

MANY as were the 'hairbreadth 'scares' from massacre during the Indian Mutiny of 1857-58, there are few which surpass the closeness of the shave I then had for my life. I had been a sergeant in the Bengal Horse Artillery, than which, I believe, a better corps never existed. I was then an overseer of Public Works at Jhansi, in Central India. I rode like a centaur; and if there was a thing I loved, it was riding a horse that was a good jumper. Such a one I luckily had then, or I should not be alive to tell this tale.

Though the first outbreak of the Mutiny at Meerut came like a clap of thunder out of a clear sky, so utterly unexpected was it by the Europeans, yet, after that first explosion, all who had eyes to see perceived that other local outbreaks were only a matter of time and detail. So it was at Jhansi, which was garrisoned by a regiment of native infantry. All, except the infatuated officers of that regiment, knew that the soldiers were only awaiting news of some further success to their cause to join their brothers-in-arms. The officers persuaded themselves that their regiment at least was loyal, and lived in misplaced confidence. I was a young bachelor, and therefore less anxious than I should have been if I had had a family to look after and save. I could not, of course, go away, because my duty required my presence in Jhansi; and day by day, as rumours of more and more extensive defections reached our ears, I saw more clearly that when mutiny broke out at Jhansi, it would be difficult indeed for the few Europeans to escape to any of the strongholds, few and far between, where the presence of European troops gave Europeans a chance of present safety, and a base for future struggles for supremacy with the mutinous natives. Jhansi was surrounded with disaffection and far from help.

It was a bright morning in June. After finishing a few eggs and toast, which with coffee makes the Indian *chota hazree* (small breakfast), I

started on horseback on my daily tour of inspecting the buildings under construction or repair. I had a hunting-whip in my hand, and a few rupees in my pocket. It was very early. I just barely noticed that my servants (in India they are all men) were grouped together as I left the gate, instead of being at work; and that unusual silence and quiet reigned in the bazaar or line of shops through which I passed. The bugles had sounded for morning parade before I started from home; and the native infantry regiment was already at its drill as I passed the parade ground. I soon met my superior officer, the executive engineer, received his orders for the day, and went about my work. Very few of the workmen had put in an appearance, and even these were not at work, but seemed evidently to be expecting some event. On my urging them to work, they grinned in silence, and then began handling their tools, but very listlessly. My duty had taken me far away from the parade ground, and, luckily for myself, into quite the opposite part of the Station, as we call the garrison towns in India.

I heard a roll of musketry-firing; but that was no unusual sound in a military station, nor alarming to a military man: it did not at all attract my attention. But that roll was followed up by a succession of solitary shots at irregular intervals; and these, I knew, formed no possible part of the evolutions of a regiment at drill. My heart stood still for a moment. The long anticipated time had come: the men had mutinied, and were shooting their European officers. Just then, a mounted officer rushed by me, urging his horse to racing speed; and as he passed, he called on me to flee for my life. Away we went; and he told me nearly every officer had been killed, some by the first volley, and others by the dropping fire. We galloped on along the road, not recking whither. Suddenly, some soldiers appeared at a distance and pointed their muskets at us. To pass them was impossible. We turned sharp to one side, and put our horses to the low wall and fence that edged the road. My horse rose and cleared it in splendid style; but the officer's heavier charger fell with him. I dismounted to help him; but he lay stunned and unconscious. The bullets of the soldiers were falling around us. I could do him no good, and to linger was but to lose my own life too. I mounted again, and continued my flight, clearing every hedge, fence, and ditch on my way across country. Many a shot was fired at me; but luckily neither I nor my horse was hit. In a few minutes I was out of sight of my pursuers, and safe for the moment.

I checked my horse, to gain him time to breathe, and myself to reflect on what I should do. I found that I was near the road that led to Gwalior, and not far from some brick-fields which were under my supervision. Of course I knew the men engaged there. It was a question whether they would or would not turn against me. But I trusted to my popularity with them for one thing; and for another, to the swiftness of my horse. It was indeed necessary for me to seek some shelter for the day; for a summer sun in India very rapidly becomes too hot for European comfort or safety. My only chance was to continue my flight at night; I therefore rode into the brick-fields. I found but five men at

work; they had all heard the firing, ha' guessed what it meant, and the others had gone to hear and see what had resulted. My men expressed their joy to see me unhurt; and urged me to take refuge with them for a while and to continue my flight afterwards. I dismounted, therefore, and was taken into one of their huts. Then we all sat down and discussed the situation.

'No one,' they said, 'will come to look for Europeans in our huts, for we are too poor and miserable to be thought of, or suspected of harbouring you. But your horse will betray us; for if he is seen about here, they will, of course, search the huts.'

'Besides,' said another, 'you cannot expect to escape on horseback, for, under existing circumstances, that would be too conspicuous a mode of travelling, especially with English saddle and bridle.'

'Your only chance, sir,' said a third, 'is to travel by night and on foot, in order to get to Gwalior unobserved.'

I told them I was entirely in their hands, and that I trusted to their goodness for my chance of escape. Even with the sense of the imminent danger in which I was placed, I had time to observe with satisfaction their simple gratitude for the little—indeed nothing more than justice and some kindness of manner and word—that I had done for them.

'You have been good to us,' they said; 'you have been our father and our mother [*mai-bap*]; and we will do all we can for you.'

And they did a great deal. For five days I lay hid in their huts; for the native soldiers or sepoy had scattered themselves over the country, pursuing the few Europeans who had escaped the massacre at Jhansi. Every one of them except myself fell into their hands during this savage hunt, and was ruthlessly murdered in cold blood. The hunters returned to Jhansi; but many were still about, patrolling the countryside, to pick up any straggling European wending his way from some scene of massacre towards the few stations where European life was still safe.

The bricklayers first gave a smear here and there with clay to my horse and his saddle, trailed his bridle on the ground, and turning his face homeward, gave him a good cut of the whip. He went off; and I never saw him again. They left me alone in the hut and went about their own affairs, as if nothing unusual had occurred. Unleavened cakes (the well-known *chapatties*, or wheat-cakes) and milk was all that they could get for me—their own food; because to have sought for better fare would have excited suspicion. On the evening of the fifth day they told me I had better start, as the sepoy had returned from their hunt. They got some berries, and with their juice they rubbed my face and body and hair, and changed my rather florid complexion into one of genuine dusky Indian hue. A suit of rough workman's clothes—trousers and short shirt—were put on me; a turban was tied on my head; a *chuddur* (sheet or mantle) of cotton was thrown over my shoulders; and my stockings and boots were replaced by a pair of old native shoes. They refused my offer of the few rupees I had about me; but tying them in a rag, they tucked them

into my waistband. After dusk, they conducted me a couple of miles on the Gwalior road and bade me farewell.

I have often heard Europeans say that there is no word in the Indian language for 'gratitude.' I do not know. Those poor bricklayers at any rate showed me that the thing itself is not altogether absent from Indian hearts.

How can I express the sense of utter loneliness which I felt when they had left me! About seventy miles of a good straight road lay between me and the friendly haven of Sindhia's camp at Gwalior, for which I was bound. But I knew that not a friendly soul lived between. I could trust no one on the way. I must avoid all contact with the natives, lie hid by day and travel by night, seek food and water by stealth, and carry my life in my hand—the sole European wandering over miles upon miles of hostile ground. Under ordinary circumstances, I could easily have done the journey in four days. But unaccustomed to the peculiar Hindustani shoes which I now wore, I could not do my best. What creatures of habit we are, to be sure! I found that my progress was not rapid, and blisters very soon began to burn on my feet for want of stockings. I had not done ten miles, when the dawn appeared, and I began to look out for a hiding-place. I went off the road and climbed into a large widespread tree, and was well hidden in its leafy branches. From this lofty perch I scanned the country round; and, to my great delight, I saw a small pool of water not far off. I was feeling very thirsty; but still I was obliged to wait patiently in my friendly tree for many a long hour, because, with the dawn, travellers came up who had begun their journey early, taking advantage of the cool of the morning to reach their first halting-place, for their mid-day meal, before the sun became too hot.

It was nearly noon, when seeing the road quite clear of enemies—for such to me were all who passed—I slipped from my tree and hastened to the pool. Under other circumstances, I would not have touched such water with my fingers; for it was a pond frequented by cattle, and consequently none of the purest or cleanest. But now! I was agonising with thirst; and it was a pleasure not easily understood by those who have never undergone such an ordeal to find the all-necessary water near at hand, no matter in what state. The forethought of my friendly bricklayers had provided me with several wheat-cakes, enough to satisfy the wants of nature for a few days. At the edge of that pool, under the blazing sun, I ate a few of my cakes, and drank of the filthy water, which yet seemed nectar to my parched mouth. Then I hastened back to my tree.

Late in the evening, when the short tropical twilight had been extinguished in the darkness of night, I descended, and went forward again on my solitary way. My feet were all the worse for my first day's journey, and I had had no sleep in that time. My progress was proportionately slower. The dawn saw me hardly eight miles from my starting-place. A ruined edifice some distance off the road was my shelter on this day; and in the area enclosed by its dilapidated garden wall I found a well, and luckily an old bucket and

half-rotten rope lay near it. Again I ate of my cakes, and I drank of the well water, and was able to have a good sound sleep in the friendly shelter of the ruin. Tired in body and wearied in mind, I slept long indeed, and night had already fallen when I awoke. After more food and drink, I started again, much refreshed with my rest. I travelled again all night; and in spite of my sore feet, I forced myself on, and made good progress. But the next morning found me in a sad predicament. I could see no cover or shelter of any kind, except a small clump of tall trees in the far distance ahead. I made for it, but with a heavy heart, for I knew that it indicated the roadside well where travellers rest for their mid-day meal. Such I found it to be. Still I could do nothing else; there was no other place to rest in. Perhaps also my success so far had emboldened me to a little negligence. I went up to the well, had another feed on the last of my wheat-cakes, and a hearty drink from the well. I then retired to the furthest of the trees, and lay down at full length on the ground, covering myself all over with my *chuddur*. This was rehearsing what I intended to do when travellers came up, for thus the natives are accustomed to take their short mid-day rest. At first the coast was clear, and I could lie at ease, with my head uncovered: I dared not trust myself to sleep. Very soon, however, travellers began to pass along the road, and many looked curiously at the lazy man who had either overslept himself till too late in the morning, or was beginning to sleep too long before noon. They were, however, too intent on their own journey to mind me much, and they went on; it was not from them I expected trouble.

The crucial time came as noon approached. The blazing sun shone in full glory and heat. Travellers began to drop in at the well. I covered myself—head and all—with my mantle, pretending to be asleep, but carefully noticing every arrival. Among them, to my horror, I saw two sepoys armed with swords. They in due course began their meal, chatting freely; and I lay quite still, hoping that, after food and rest, they would proceed on their way, leaving me once more at liberty to resume my journey. Unluckily, the sun had begun to beat upon me; yet I dared not move. The mere fact of my lying thus still and immovable made them suspect I was a corpse.

'Perhaps he has been poisoned,' said one.—'Or died of a snake-bite during the night; those cobras are so deadly,' said another.—'He may have money on him,' suggested a third.—'He evidently does not hear us,' said a fourth; 'let us go and see how matters stand.'

Slowly two of them approached me, shook my shoulder, and at length gently raised the *chuddur* from my face. At the first glance, they sprang back, shouting the word 'Faranghi!' (European). I jumped to my feet; and in a moment I was surrounded by the entire group, including the two sepoys, with their swords now drawn.

At first I felt quite dazed, for I could not comprehend what had so suddenly betrayed me. But on their pointing to my face, and one of them producing a small pocket mirror (such as native dandies often carry about), I looked in the glass and saw a strange sight. While my blue eyes

showed that I could not be a native, I had also, while drinking, washed off the berry juice from my lips and part of my face, disclosing portions of a white skin, which convicted me of being a European indeed. It was useless to struggle or resist; the band was too numerous, and two had swords. They seized me at once, and dragged me nearer the well, and my hands were tied behind my back with the bucket rope. Some were for killing me at once. But the two sepoys, greatly extolling their own prowess in having made me a prisoner, said that I belonged to them, and that they would take me on to Jhansi, where a reward was offered for every European brought in. As they were armed, no one disputed their argument, and I was left to them.

After a while, I was told by them to walk on between them. I did so, for resistance under the circumstances would have been madness; nor was I without hope that some unforeseen chance might yet enable me to escape. They were now, after all, only two to one, because, to avoid sharing their expected reward, they would not allow the others to travel with them. After having walked several miles back towards Jhansi without offering any resistance or making any remark, I saw with delight that they became less suspicious and observant of me and my doings. I gradually and cautiously tried the rope that bound my wrists. Luckily, it had not been knotted with the skill of a Jack-tar; and I found after a little working that I could easily free my hands. I was far too cautious to do so at once, however; I was determined to wait for a favourable chance.

That chance came much sooner than I had expected. The day was very hot; and it was not long before we were all very thirsty. A little after four in the afternoon, as we walked along, one of them said: 'I see a well, a little off the road; let us go and drink.'

'We had better hurry on to Jhansi,' said the other.

'It will not take long,' said the first; 'and we must take care that our prisoner does not die of thirst or of sun-stroke, to which these cursed Europeans are so subject; otherwise, good-bye to our reward.'

'Very well,' said the other. 'I have heard it said that brandy causes sun-stroke, and drinking water keeps it off.'

'He has accompanied us very tamely,' said one.

'He must be a coward,' said the other; 'they all are, except when they are together.'

I listened, but said nothing, and we went to the well, some distance off the road. One of them ungirded his sword and put it down on the ground while he drew water from the well. Near it sat the other sepoy, his sword at his belt, waiting for his drink, while I stood near him, with my hands behind my back. Now or never, I said to myself. I quietly slipped my right hand from the loop that held it. To seize the sword on the ground and draw it was the work of an instant; the next, the sitting soldier fell a corpse to the ground, with his head almost severed from the neck with one blow of the sharply ground sword. At the noise of the attack, the soldier who was drawing water turned round, and for a moment was petrified at seeing his late prisoner

free, brandishing a naked sword, and slaying his comrade. Recovering himself, he rushed at me with a shout; but him also I slew with his own sword.

I was once more free, and what is more, I was now armed. From my dead enemies I took their *chapatties*. In India, travellers generally carry some food with them, to meet the not unfrequent cases of finding scanty supplies. Not a soul was in sight. I ate and drank, and thanked God for my deliverance. Then I started once more in the Gwalior direction, but I kept clear of the road. I led the life of a nocturnal animal, resting during the day, and hiding as I best might, but during the night pushing forward at my best speed towards Gwalior. When the soldiers' *chapatties* were done, I satisfied the cravings of hunger by eating mangoes from the trees or the melons in the fields. Nor did I disdain the raw cobs of Indian corn, or in fact anything edible I could find. Never could I have believed in my old soldier days, when we used to grumble at our beer and beef and bread as supplied by the commissariat, that I could ever have managed to get down my throat what I ate with such relish during those four days. We never know what we can do till we try.

On the eighth day after leaving Jhansi—the fourth after slaying the soldiers—I reached Gwalior, wearied, fagged, footsore, and almost tired of life. Another couple of days of such misery, and I should either have lain down to die, or have recklessly thrust myself into the midst of my enemies. But the distant sight of the great rock-fortress of Gwalior revived my spirits. I was soon conducted to a house, and tended and cared for, by order of Maharajah Sindhia.

Oh the luxury of a bath, after all that time and travel and suffering! A few days of rest and good food had almost set me up again, when I was once more started on my flight. The Maharajah continuing loyal to the government, incurred the animosity of his own people; and after a time of seething discontent and ill-suppressed murmurs, his troops broke out into open mutiny against him, crying to be led to join their brothers in arms. Attended by only a handful of faithful servants, Sindhia was obliged to flee to Agra for his life. Gwalior was of course now become too hot for any European; and I followed Sindhia's example.

Again I started on my wandering; but this time I had fewer adventures, for the distance was shorter. On the second day, I swam across the river Chumball, at the imminent risk of being seized and devoured by one of the numerous alligators that swarm in its waters. But on the other hand there was the certainty of being seized and slain if I sought the ferry: bridge there then was none. I passed Dholpore; and soon found comparative safety under the influence of the vicinity of the European forces at Agra. There, in due course, I arrived, safe indeed as to life and limb, but I was not a very presentable object. My feet were blistered, swollen, and torn; my clothes were filthy and ragged; my skin was tanned and raw with the heat of the sun; and my eyes were inflamed and nearly blind from the continual glare and fine dust of the road. In all, I had done about one hundred and thirty miles, I may

say barefoot, for the native shoes I had got from my bricklayers proved almost worse than useless to me.

As I came near to Agra, late in the afternoon, a lady driving in her carriage saw me, and very kindly took me up and conveyed me to the fort, still a good distance off. The neighbouring Europeans had found shelter and safety in Akbar's old fortress, which was garrisoned by a large European force. I was taken to the Commandant, who heard my statement of what had occurred at Jhansi; and I was then attached to the battery of artillery in garrison. But I did little duty. An attack of brain fever soon followed; and during it I was nursed with the utmost care and tenderness by the wife and daughter of our sergeant-major. Before a year was out, I married that girl. When India had been reconquered and peace restored, I was sent back to the Public Works Department. I have risen; and I now bear the commission of a lieutenant in Her Majesty's service. As I owe this rise to the steady habits insisted on by my wife, and as I could not have got her, in all human probability, but for the mutiny at Jhansi, I don't grudge the sufferings, great as they then seemed, which I endured in my escape.

PRESENTS.

THE subject of Presents, their giving and their receiving, is one which periodically makes its appearance in every household. On the wedding of any near relative or intimate friend, the matter is revived; and in spite of the large amount of discussion the question on each occasion receives, a similar condition of nebulous uncertainty exists whenever the point recurs. To those who enjoy in any fashion the sweets of domestic life—which a cynic once stated to be preserved in a family jar—the discussion of the matter is a familiar incident. The ethics of giving presents are essentially subtle. It is curious to observe with what a delicate sense of the fitness of things the eventual choice is made by the feminine side of the family, and not without reason, for many important points have to be taken into consideration which the male mind is somewhat apt to disregard. In the first place, the sum to be expended in the purchase—a feature usually regulated by a sliding scale finely graduated to the social or other estimate of the recipient, and his or her known power of appraising or appreciating whatever may be given.

There is, of course, much that is genuine in the feeling which dictates the custom of giving presents; but it is impossible not to see that in many cases it is regarded as a social exaction, severely taxing alike the purse, the ingenuity, and the tact of the donor. Where the genuine desire exists to increase one's friends' or relations' possessions with some positively useful or seasonable object, there is usually very little difficulty in the choice; but when, as in the present day, so many subtle social factors are brought into play in the regulation of friendship, the trouble is—to some people at least—considerable. It may safely be said that no small element of

pride enters into the matter; and nowadays, when the daily papers give at length—if scarcely so fully as do their contemporaries across the Atlantic—a list of the presents at the various fashionable marriages, a fresh element is introduced. Indeed, it may be said that the custom of making a display of the wedding gifts is not a little calculated to enhance the value of the original choice.

The wedding-present difficulty may be regarded as one of a peculiarly exasperating nature to all concerned, except, perhaps, the manufacturers and vendors of such expensive trifles. The singular monotony which usually marks the choice of such gifts has, it is true, of late years been somewhat relieved by the American innovation of handsome cheques in lieu of some costly trinket; but the custom, for reasons too obvious to mention, has never found any very general favour. In this connection, a point in which a vast amount of ingenuity will be displayed by some is the skill with which a purchase will be made, the actual value of which it would be difficult for any but the initiated to suspect. To obtain something which will look like what it has cost, or, if possible, a little more, is a desideratum with not a few. Again, to those who possess a large circle of friends and acquaintances, there enters the question of duly considering the natural susceptibilities and the tastes of each and all; in the present day, indeed, the latter point is one which needs most careful consideration. With those who are known to possess a knowledge of art and the many fascinating ins and outs of bric-à-brac, greater care in selection is necessary than with those who are regarded by their friends as being indifferent to such matters. Altogether, the question is one fraught with innumerable difficulties. The Queen, as is well known, has long since reduced the anxieties of her task in the matter of wedding presents by confining her gift to the same unvarying article, a handsome Indian shawl; and not a few knowing ones have followed the excellent example set by Her Gracious Majesty.

In spite of all these inconveniences, it must be of pleasure that there remains some slight element for the choice in the matter of present-choosing, exercise of a certain amount entails the pleasant it may be added, not a little of patronage, and the concomitant excitement of turning over any quantity of articles to be selected from. Bewilderment, it is true, only too usually on such occasions seizes the unwary, with the fatal result so familiar to all who have either been married or had any acquaintance with newly married couples. An eminent Associate of the Royal Academy—now, alas! no longer with us—indeed known to have once affirmed as one of the reasons for his refusing to enter into the state of matrimony, that he dreaded the avalanche of wedding presents with which he knew he would be overwhelmed by an admiring circle of friends and relatives, whom he would be too sensitive to offend by treating their respective offerings in accordance more with the artistic taste displayed by each than by the position of the donor. As a matter of fact, this latter point is not the least of the many difficulties surrounding the question of giving presents. Though in the abstract, and

indeed in the concrete, it may seem pleasant to receive presents, in not a few cases their receipt is regarded only in the light of a troublesome formality, the very practical expression, in fact, of that species of gratitude which has been well defined as a lively sense of favours yet to come; for it would seem a tacitly accepted understanding that some return is expected. Again, there are the presents which certain persons of grateful disposition consider it right to bestow on friends and relatives for services rendered—services which could not exactly be repaid in money—a form of present which happily possesses few or no disagreeable elements, though requiring, it may be mentioned, not a little tact in its management. This tact is no less necessary in the distribution of those well-meant and generally essentially useful presents which the well-to-do are in the habit of despatching from time to time to their poor relations.

In spite, however, of all these and numerous other features, many of them agreeable, many others very much the reverse, which enter into the question, the custom of giving presents retains its hold on society, a hold which, indeed, it is safe to predict, it is scarcely likely to lose, for the institution is one apparently ingrained in human nature. The modern sociologist will of course prosaically account for the fact by telling us that we inherit, from an earlier and somewhat less barbaric state of existence, the tradition of a motive of propitiation in distributing gifts among those whom we thus flatter by silently implying our sense of dependence on their protection. This, of course, is the theory of the Oriental custom to the present hour. We in the West have, however, come to lose this deeper meaning, while we have none the less retained the custom.

BEAUTIFUL FOR EVER.

SOMEWHERE there is a radiant land,
All beautiful for ever,
A world by balmy breezes fanned,
With skies unclouded ever.
Upon that stormless shining shore
Falls music as in days of yore,
For ever and for ever.

There, Time can never dim the light
Of eyes which sparkle ever,
For golden hair grown silver bright,
Is beautiful as ever;
While on the brow Care cannot trace
A line that Love would not efface—
For ever and for ever.

Here, close at hand, before our eyes,
Unveiled by Love's endeavour,
That land immortal round us lies,
All beautiful for ever.
Seek not some distant dreamland shore,
But here, Love murmurs o'er and o'er,
Dwell ever and for ever,
Beautiful for ever.

OUR WEATHER-EYE.

As the metropolitan, not to call him the Cockney, humourist remarks, 'There's a deal of weather about just now!' and surely—the gist of this joke lying of course, as it does, in the fact that no particular sort of weather is specified—the familiar saying has the advantage of being applicable to all times and seasons. Hence, although at the present writing there happens to be a bitter frost and a leaden, snow-portending gloom prevailing, very likely by the time these words find their way into print we shall be enjoying the first genial breath of spring, the glorious warmth of midsummer, or the mellow calm of autumn. But what of that? It makes no difference in the pungency of the facetia, and we hold it a great thing to be able at a moment's notice to have a brilliant observation of this kind ready to our lips. When, too, it is remembered how popular the topic of the weather always is, and how constantly we are called upon to refer to it in a casual way, we should not undervalue the privilege of living in the midst of a community where jokes of this refined and erudite pattern are commonly bandied from mouth to mouth! Londoners, if not credited with equal smartness to what is usually found on the other side of the Atlantic, are at least not deficient in the quality, and may be honestly said always to have their weather-eye open.

Amongst the people who practically and literally live with their weather-eye open, sailors and shepherds take the first place. But of those who are distinguished for a like sharp-sightedness, in the moral sense of the expression, it would not be possible to make so easy a classification. Lawyers and gentlemen 'in the City,' perhaps, would generally be regarded as hard to beat in this respect; but as nowadays, just, indeed, as in former days, everybody is bent on personal advancement, we must suppose that it is only a very few who fail to keep a sharp lookout (in other words, to go about with their weather-eye open!). Naturally, in every congregation of men

there will be found a percentage of purblind beings who, to judge from their behaviour, wilfully and persistently shut that particular eye, right or left, which, if but only opened a very little bit, would show them the proper course to adopt. Unfortunate folks there are, who, as the phrase runs, will ever be blind to their own interests, and who, when their attention is drawn to the point—that is, to the right line to pursue—will stubbornly maintain that they do not see it, or that they do not take your view of it. According to their own accounts, however, this class cannot be large, for who admits he is not wide awake? Who is not always keeping his weather-eye open? The result of the individual's own exertions is the test; and it is only when we examine the failures and successes in life, that we can arrive at a just estimate of the numbers who have retained a fixed gaze on the main chance.

Then, again, some difficulty arises from the various powers of sight or degrees of discrimination possessed by certain people. The vision of many is so different from what would be naturally expected—they take such determinately wrong views of things—that one begins to doubt if their moral optics can be anatomically constructed upon normal principles. They see things so perversely, that they may be said to resemble the colour-blind, and are so, indeed, literally, for they seem incapable of discriminating between what are storm-clouds and what is blue sky in their outlook. Hopeless creatures these, in every sense, and upon whom our Cockney jocosity would inevitably fall flat; for what would be the use of telling them that 'there is a deal of weather about,' when they have scarcely a notion that they are surrounded by an atmosphere of any description—when they are, in a word, so 'right-and-wrong blind' as to be perpetually averring that black is white.

Since, too, this blindness includes deafness—for sounds do not seem to convey the same meaning to them as to ordinary mortals—it is a pity these infirmities are not accompanied by that dumbness frequently associated with the

latter affliction. Were this so, we should at least be spared a vast amount of vapid and misleading jargon.

Hopeless therefore as it appears, to get quit of this inevitable percentage of wrong-headed people, it is pleasant to turn our 'weather-eye' towards the heavens themselves, and away from all metaphorical allusions to them. We have hinted that sailors and shepherds possess the faculty of prophetically reading the signs of the sky more correctly than most classes. This is perfectly natural, for, to take the mariner first, his very life depends on the keenness of his optic nerve. His avocation trains him to keep a wary watch upon the slightest indications of change of wind or weather, and to interpret them aright on the instant. Disaster and wreck are the inevitable consequence of any neglect of this study, and if he be caught napping, woe betide him indeed; moreover, it is to the sailor we owe the very expression the 'weather-eye.'

The coast populations and 'waterside characters' generally, also acquire a familiarity with the elements little short of that of those who actually 'go down to the sea in ships'; but of all the dwellers on land, the shepherd is the soundest weather prophet; and luckily, for if his own well-being is not imperilled by an ignorance of atmospheric fluctuations, at least the lives of his flocks depend entirely on the acute perception of his 'weather-eye.' He is well aware that according to the way in which he judges the skies will greatly depend his success or failure in bringing young lambs into the world and guarding the lives of their mothers. Not necessarily, however, is he always looking aloft for the clue which is to guide him in his preparations; the movements and behaviour of his charges themselves reveal to him much of what may be anticipated.

A story used to be told in illustration of the shepherd's weather-wisdom by Lord Palmerston, who, one fine morning, when riding across Salisbury Plain in company with a delicate friend who much feared a wetting, asked a shepherd what his opinion of the weather was. Looking critically around him, not at the heavens, but at the movements of his sheep, the man replied: 'It'll rain afore evenin'.' The two horsemen were incredulous, for the weather was simply superb at the time, the perfection of a summer day—a day the like of which can hardly be met with in any country but England, when sun and air mingle in such sweet proportion, and so temper each other, that the man would be hard indeed to please who could not attune his nature to his surroundings—a day, in fact, which would be likely to evoke another pleasantry from our Cockney commentator, in the remark that it was 'a fine day for the race!' meaning the human race. So, the friends, disregarding the shepherd's warning, rode on, and were thoroughly drenched by a shower which fell soon after noon.

'How did you guess it would rain?' asked Lord Palmerston, as damp and disconsolate, he and his friend passed the same shepherd on their return homewards.

'Whenever you see yon old tup rubbin' of hisself agin' that post of a mornin', answered Colin, 'be sure it'll rain afore night!'

Animals, after all, are endowed with instincts in this matter of weather, as in many others, which might put much of man's boasted science to shame; though why, in this instance, the old tup always scratched his back against a post when rain was coming, it is hard to guess. The only inference is, that in the mysterious and unseen working of the laws governing the universe, the approach of rain is heralded by some irritation of the sheep's coat, which acts more directly, or at least more practically on his dull brain than all our weather-eyes put together do, on what we are pleased to call our cultivated intellects. We may take it as indisputable if we please, that, according to the old jingle, 'a rainbow in the morning is the shepherd's warning;' but how if there be no rainbow? and Lord Palmerston evidently could not have seen one that morning, however wide he might have kept his 'weather-eye' open; nor the shepherd either, for the matter of that; but he had learned by rule-of-thumb that it was not always sufficient to direct his 'weather-eye' to the weather itself. Few people whose avocations lie mainly out-of-doors in the country fail to acquire a smattering of weather-wisdom from the same sort of source—that is, from observing the habits of the animal world, from the cattle in the fields down to the smallest thing which creeps or flies.

Some birds are especially knowing in their behaviour meteorologically, or they look as if they were. Who has not seen the way a jackdaw or a magpie, for instance, cocks his eye upwards, as if constantly on the lookout for squalls? And if we are unable to detect anything significant in the aspect of the skies to justify his anxiety, we may be sure our feathered friend could put us up to a thing or two, if he chose, of which through our own senses we have not the faintest inkling. Ducks, swallows, starlings, sparrows, and the rest, all shape their behaviour and their notes according to what the weather not only is, but is going to be; and without possessing any definite acquaintance with natural history, residents in the country, observing them, acquire, like the shepherd, a weather-wisdom impossible for the inhabitants of large towns to attain to. Their comfort or interests are seldom, or only indirectly, affected by the weather. Except when an east wind is blowing, the Londoner scarcely notes the points of his compass, and often could not tell you which is north or south. He has no crops, livestock, or gardens to think of, therefore he is not driven to keep his physical 'weather-eye' open in the way rural populations are. For this reason we suppose it is that he and his kindred endeavour to make up for the deficiency by cultivating their mind's eye to that pitch of sharpness always supposed to characterise the town mouse, when compared with his young friend from the country.

When meteorology shall have become an entirely exact science—and its strides during the last twenty years suggest that this desirable end is not far off—we that smoke-dried citizens may also become as knowing about weather as sailors and shepherds. A 'weather-eye' will be provided for us by the official department, and we shall be in

a position every morning at our breakfast-tables to adapt our actions and costumes to the meteorological prospects not only for the day but possibly for a month ahead.

JOHN VALE'S GUARDIAN.

CHAPTER XXI.

AND now, if you please, for a while we will go into pleasant company. Who pleasanter, this pleasant summer morning, to begin with, than Miss Cecilia Shorthouse, trimly attired in a pink spotted cotton print, going demurely about her preparations for her own and her father's breakfast? Pink is not the colour the best suited to a blonde, but it has a neat fresh brightness of its own, and a pretty girl of an honest complexion will contrive to look well in almost anything.

The summer brightness lay outside on the wide fields, the scattered cottages, the well-kept farmyard, and the rambling disorderly old garden. Roses pushed into the diamonded window, and soft flecks of sunlight stealing in between their close tracery went sliding and glancing about the red-tiled floor of the kitchen. The scrupulous cleanliness of that apartment combined with Cecilia's own neatness of aspect to flatter her talents as a housewife. The polished steel fender glowed ruddily in the light of a small clear fire. The odour of coffee and the snizzle of frying bacon pleased ear and nostril with appetising suggestion. The brownish napery of the table had a country freshness in its look, and an odour of the country, caught from the grass on which it was bleached after every washing. The rough table service was lustrous with mere cleanliness, and Miss Cecilia, moving deftly here and there, looked like a pretty genius of household order and comfort.

The farmer her father came clamping over the brick-paved footway which led between the untrimmed masses of flower and shrub from the gate to the kitchen door. He brought a field-appetite with him; and as he stood at the doorway scraping the soil from his boots, a grunt escaped him, expressive half of expectancy and half of satisfaction. 'Breakfast ready, wench?' he asked, with a tone of approval.

'All ready, father,' said Cecilia.

The farmer hung up his hat, and took a seat near the table, with a hand on either knee. Cecilia set before him a mighty dish of fried bacon; and whilst he transferred a portion of it to his plate, poured out his coffee. He set to work gravely, like a man who meant business, and his execution by no means belied his air. Eating was too serious a business with Mr Shorthouse to be mixed with anything so trivial as mere conversation; but when the meal at length was over, he pushed his plate aside, and heaving a full-stomached sigh, turned half round from the table, and fixed his daughter with a glance which was both bovine and kindly, and had a distant, nine-tenths hidden gleam of humour in it. 'Well, my wench,' said he by way of exordium.

'Yes, father,' Cecilia answered.

'Thee'st been thinkin' for a fortnight,' said Shorthouse, with the slow contentment of a well-fed man. 'Hast made up thy mind upon the matter yet?'

'What matter, father?' asked the demure Cecilia.

The distant look of humour in the farmer's eye flickered nearer, and darted inward again. 'Fill me a pipe o' 'bacca, my dear.'—The girl took a long clean clay from its place upon the mantelpiece and obeyed his request.—'Now give me a spill.' He pulled slowly at the fragrant bowl, resting an elbow on the table, with the stem of the pipe poised lightly in the cleft prepared for it by a broad thumb and forefinger. 'Sit down. Let's have a talk. There's Mr Snelling waiting for his answer. How long dost mean to keep him?'

The girl made a faint motion with head, hands, and eyebrows. The compound gesture seemed to signify that the query was of no moment, and that she had not thought about it.

'Oh, tut, tut! my gell,' said Shorthouse. 'Fie, fie! It'll never do to treat a man's offer in that sort of way. You'll be gettin' a name for coxcombishness. Snelling's a good chance, Cecilia, and there's many and many a gell would jump at him. He's warm and he's solid, and what's more, he's an out and out John Bull. It's true he ain't as well off as we thought him since young John Vale's turned up again; but he can play at countin' ha'pence with most folks hereabouts, and he'd win with nine out o' ten of 'em. He's old enough to know his own mind. He's made one woman a good husband already, and there's little doubt as he could please another. I think very high of Robert Snelling, Cecilia; and as for the lyin' stories that are abroad about him, I value 'em less than I do a puff of this 'bacca. Annyway, it's the part of a good wench to let the man have his answer. Think about it. Come now. Is there anything in your mind agen the man?'

The girl gave the same curious no-answer as before.

'Come, come!' said her father. 'Thee can't find a Yes o' a No. I've never been the man to persuade a gell to marry agen her own wishes. I've seen mischief come o' that sort o' thing i' my time; and if you can't like him, you can give him a civil "No, thank you." I shall be a bit sorry if it comes to that, for I've a kindness for the man, and I should like to see thee settled.'

Cecilia, who had taken a seat opposite to her father after filling and lighting his pipe for him, now rose slowly with downcast eyes and began to clear away the breakfast things. She had never read a play, a love-poem, or a romance in all her life, and she had always quite naturally supposed herself to be a young person of a business turn. The proposed marriage was practical enough, and looked likely to be prosperous. She could have the handsomest of dresses. There was a dashing trap to drive about in. None of her schoolmates or acquaintances had made so excellent a match as was now offered to her; and half the girls of the district would have been ready to pull caps for the favour of so eligible a groom as here came a-courting. But very dimly and vaguely the girl felt there was something wanting. A little course of romantic reading might have told her what it was; but, as has been said already, her maiden fancies had received no help of that sort, and she was left to her own resources. These seemed to help her very little, if at all. There was nothing to be said against

the marriage, and there was very little more than nothing to be said in its favour. She was sufficiently happy and contented as she was; and Snelling at least had no power to spread over the cold outside world which lay beyond the home of childhood and maidenhood that wonderful glamour of hope and yearning for which every woman looks instinctively once in her lifetime. Love is not a thing of looks exclusively, and the experiences and confidences of lovers would find their way through the world without the aid of the romancer's art. Certain tender, foolish little secrets had been breathed to her by old school-companions who had been led across the boundary of love's golden realm. She knew by intuition that there might be more in marriage than a mere change of home and companionship; and the sentimental whispers had found an answering echo in her heart. Experimentally, she knew nothing. It goes without saying, since she was a pretty girl, that at least half a score of the young men of the neighbourhood had made sheep's-eyes at her. She had thought them infinitely ridiculous and tiresome, as girls will do until Mr Right comes along, as the country phrase has it, when, somehow, they find the same airs and appeals on a sudden grown infinitely touching and pleasing. But Mr Right had never presented himself even for a moment within the bounds of Cecilia's horizon. She walked in maiden meditation, fancy free, and when the middle-aged lover came with his solemn respectable ways and his round balance at the banker's, she knew not what to make of him or what answer to give him. The merest hint of experience would have told her that she was shockingly indifferent, and that a marriage under such conditions would have been a crime against herself. A sensible mother would have enlightened her in a day; but as it happened, she had no guide at all.

'Come!' said her father, when he had watched her for a minute or two as she moved about the room, 'try and mek up a mind one way or another, Cecilia. You hurt a man's pride in himself, keepin' him waitin' i' this wise.'

'I don't know, father,' Cecilia answered. 'My mind goes shilly-shally. I don't think I like Mr Snelling well enough to marry him. I'd sooner stop at home. I don't want to marry anybody. —You don't want to get rid of me, do you, father?'

'The sakes*forbid!' the father answered. 'Do what you like, my gell. Only mek up your mind. See if you can't mek it up to-day. I'm away to market; and I shan't be back afore night-time. It's a hundred to one I shall meet Snelling there; and if you'll promise me as I can give him his answer to-morrow, it'll be a load off my mind. Now, ther's a good wench—let it be Yes or No to-night.'

Cecilia stood before him with the coffee-pot in one hand and the sugar-bowl in the other, looking downwards. She hesitated for a second or two before replying, and in her fluttering indecision her colour came and went. 'I'll try, father,' she answered; and almost as she spoke the words she looked up with a sudden air of resolution: 'I'll give you an answer when you come home this evening.'

'That's right!' cried Shorthouse, rising from his seat and patting her fondly on the shoulder.

'Thee'st have the wull day to think on it; and if I see Snelling, I'll tell him he can come to-night for his answer.'

'Don't do that, father,' she replied. 'You can take it to him. It will look more friendly, and perhaps it might hurt his pride less.'

'That soun'ls like No,' cried Shorthouse.

'Don't plague me now, father,' said Cecilia, with an unaccustomed touch of pettishness. 'I hate to think about it. I'll tell you to-night.' She extended the coffee-pot and the sugar-bowl widely apart, and half-laughingly, half-poutingly pecked him with a kiss. 'Go away to market; I'll tell you to-night.'

Her father chuckled her under the chin and drove away to business, revolving things in his dim mind. He was not a peculiarly intelligent man at any hour; but he was fond of his girl, and his one hope in the whole business was that she might choose for her own welfare. He had a sort of idea that she stood on a higher platform than himself, and that she saw things differently. He had sent her to a spruce and quakerish finishing school, where she had learned to speak without the broad drawl, and in an accent which seemed to him to resemble that of a fine lady; though, to a finer observer than Farmer Shorthouse, it was still rustic enough in all conscience. He was a little bit afraid of her, and she had always from her infancy upwards exercised a tender tyranny over him. If he had felt at any time that he was being governed, he was the sort of man to resent it; but the reins with which she guided him were coloured light, and so skilfully managed, that for a fair half of the good man's time he took her way under the devout impression that he was going his own.

The girl being left to herself, went about her duties for an hour with something less than her customary sprightliness; and at the end of that time, having loyally finished her household tasks, sat down to face the question: to marry, or not to marry? There was nothing to draw her, nothing to repel. She would as lieve be left alone as be troubled by the proposal, and would almost as soon have received the proposal as not. She put on her sun-bonnet and walked into the garden in a grave inquietude. Her father wished for the marriage, and had often urged her to it during the past fortnight, even whilst he had told her all along that his one desire was that she would take her own way and be happy in it.

There was a summer haze abroad, which the heat of the sun had not yet dispelled, and the gentle eminences which closed in her view on the side towards Harley were suffused with a soft brilliancy. There was always an invitation and a mystery in the presence of these distant hills. In a landscape so generally level, and even monotonous, they were a constantly evident landmark, and from her childhood upward they had stood for her in evidence of the barrier which existed between her own simple life and the great wide world beyond. She stood looking at them now with half-closed eyes, with their tender greens and grays shot through and through with softened sunshine, and a sudden yearning seized her to be beyond them and to pierce the mystery they hid. There was a pleasant sadness in her thoughts, she knew not why.

A couplet of an old hymn flowed into her fancy:

Had I the wings of a dove, I would fly
Far, far away, far, far away.

The beauty of the distance, and the mystic sense that something lay beyond for her, drew her unconscious feet from the garden into the lane. The dog-roses broke there into a riot of colour, pink and white and red; and the wild honey-suckle, then opening, made the air heavy with its odour.

The quiet lane, with its overarching hedges, and the great moss-grown boles of its forest trees here and there, was like a secluded walk in some wild garden. The banks were hidden with fern and foxglove, and a hundred exquisite weeds delighted the senses with perfume and colour. The girl walked in a waking dream, with the hunger of youth in her heart. It was a new sense, and not strong enough to be painful. The natural, wholesome country odours, the warm still air, the dancing flakes of sunlight on the road, the pleasant shadows, the hues and perfumes which surrounded her, and the hazy glories which dwelt upon the distance, all gave it nourishment in equal part. She forgot her promise and the matrimonial pros and cons, and wandered on, almost unconscious of everything but that faint, pleasurable unrest, the pure, unconscious budding of her body's soul.

She was walking on in this wise when she was suddenly startled by a wild whoop as if of victory, and looking up, beheld two boys in the act of charging down upon her. For a mere second she was startled; but a moment later she found herself shaking hands with Messieurs William Gregg and John Vale. The two boys were in holiday attire, and looked happy, contented, and well cared for.

'We've come home!' says Master Will in a tone of pride not unpardonable in a boy who has run away from home, has kept away a whole twelvemonth, and, to his own prodigious astonishment, has escaped parental chastisement on his return. Somehow or other, to run away from home is a boy's highest heroism; but if the act of escape has something of the rocket's rush and roar and glory in it, the home-coming is pretty often humiliating, and resembles the fall of the stick. In most cases, indeed, it provokes the fall of the stick in another sense; and Master William, though a staunch boy, as we have seen, had had his reasons for looking forward with some misgiving to a meeting with his father, and was proportionately rejoiced when the encounter was got through with nothing more than an affectionate and admiring growl. As for John, he lived in clover, and was beginning to believe that nobody had ever tripped on such a blunder as he had fallen into when he ran away from Uncle Snelling. For of all the indulgent guardians from whom misguided wards have run away in the history of boyish romance, none, surely, had ever been so forgiving, so amiable, and so bent on making the recovered home pleasant as Robert Snelling. The two youngsters were agreeably conscious of their own high feat, and still more agreeably conscious of the unusual fact that rebellion had brought with it pleasant consequences.

Cecilia lectured them gently as in duty bound;

and they, like the good boys they were, listened with a pretence of downcast contrition which lasted for ten seconds, and was then dissipated by the appearance of a weasel, who paddled across the road at a little distance in front of them, and of course imperatively demanded to be stoned.

Cecilia was not sorry to be delivered from her own fancies. The boys brought a healthy rush of the air of common life with them, and were so full of the high spirits proper to their age, that she herself caught the infection.

Young John, attracted by something or other, ran forward, and suddenly diverging from the track, climbed half over a five-barred gate, and began to chatter with extraordinary vivacity in an unknown tongue. A man's voice answered him from the field, and Master Gregg raised a howl of delight.

'There's old Jousserau!' he cried. 'I'll bet he's painting. He said he was going to.' The boy was alight with pleasure and excitement, and seizing Cecilia with both hands, he tugged at her eagerly. 'You must come and see him. He's no end clever. He won't mind you a bit. He's the kindest fellow in the world.'

'Who is he?' asked Cecilia, hanging backwards, and allowing the boy to pull her.

John heard the query, and scrambling down from the gate, dashed towards her. The two opened their conversational batteries at once, and were so vividly descriptive that she could understand neither. At length she silenced one of them, and so succeeded in making out the history from the other. It was this old Jousserau who had found John on the morning on which he had received that cruel blow upon the head; perhaps he had saved his life, at least both the boys were of that opinion, though it was not probable that Jousserau himself shared it with them. It was this same old Jousserau who found them weary and footsore in the streets of Warwick, and had taken them home to the kindest and most hospitable shelter. It was he, further, who had taught John drawing and painting.

The narrative concluded, both boys seized upon her and dragged her forward. She went willingly enough, being spurred by some curiosity concerning a personage who had such a double claim to distinction in those parts as to be at once a foreigner and an artist. She made some laughing protest too; but the boys haled at her, and brought her to the gate.

Jousserau, who had been at work seated on a camp-stool before a small field-casel, had risen, and stood facing the gate with a palette, a maul-stick, and a sheaf of brushes in one hand, and a single brush in the other. Cecilia had formed some shadowy idea of him in her own mind, and he contradicted it completely. The boys had called him 'old' Jousserau, and she had expected to find herself face to face with a patriarch. Seeing that he was young and handsome, she became momentarily confused, and would have run away if that act could by any means have been made compatible with her sense of dignity. The sense of dignity was not helped by the manner of her introduction to the stranger, the boys tugging at her as if they pulled a carriage, her sun-bonnet a little disarranged, and some of her hair, rebellious in spite of most assiduous dressing, flying loose beneath it. Jousserau

raised his hat, which of itself was a startling and unusual thing; but she had self-control enough to respond by a courtesy, at which Jousserau stared a little. John began to patter in French and English, making the two strangers known to each other. The artist raised his hat once more, and again Cecilia courtesied.

'Lovely day,' said the artist, in his slow, queer-sounding English. 'Beautiful spot, mees.'

Cecilia responded rather shyly, and the little Frenchman went back to his work. The girl wanted very much to escape, but was hindered by her own shyness. The boys went quiet, and stealing behind the painter, watched him eagerly, tracing their heads hither and thither to make out at what particular object he was at work. Cecilia, partly excited by their interest and partly moved by a desire to be out of the painter's sight, took up a place behind.

Good-breeding, as a thousand social philosophers have observed already, is very much a matter of nature, and Cecilia did not find her awkwardness of long endurance. By-and-by she began to be as much absorbed in the novel work before her as the artist himself. The boys were as quiet as mice, and Jousserau seemed to have forgotten their presence. But on a sudden he turned round upon his camp-stool and arose, hat in hand. 'Pardon, mees,' he said, 'if I should ask a great favour. I feel I am an impertinent. I cannot say it. My friend John shall say it for me.'

Friend John being appealed to in the artist's native language, translated. Cecilia's pink dress was the thing above all others the artist desired for his sketch. He would be immensely obliged if she would seat herself upon a felled tree half-way across the meadow, and would allow the two boys to be grouped by her. He would not detain her a quarter of an hour—perhaps not more than ten minutes.

'I am an impertinent,' said Jousserau again, standing hat in hand before her with his black eyes smiling and his white teeth flashing, and his hands and shoulders raised in a little shrug of appeal; 'but'—

'Look here,' said Will, laying hold upon her anew: 'that's where you've got to sit;' and straightway bore her off, all blushes and confusion. She walked across the meadow feeling hoydenish, and somehow guilty of a breach of the proprieties. She took her seat in the place indicated; and Jousserau, calling to the boys, directed them as to how to place themselves in her neighbourhood. They obeyed; and for a minute or two a solemn silence reigned. Cecilia was quite ashamed of herself, and was convinced that this swarthy young foreign person had no right to submit her to such an ordeal. The boys retained, with a somewhat sheepish quiet, the poses Jousserau had directed them to take. The painter, bending assiduously over his work, shot every now and again a keen glance at the group, and once or twice fixed it for some seconds at a time, so that Cecilia's embarrassment seemed to have reached its highest point. But in a very short time, in spite of these disagreeables, she found the stance over. The artist, rising to his feet, took off his hat. 'Sank you,' he said; 'I leave finish.'

'Come along and look at it,' cried John; and she was once more pulled forward. She was

bending blushing over the sketch, not quite making out its meaning in her confusion, when a sound of hoof-beats made itself audible in the lane, and looking up, she saw the head and shoulders of Robert Snelling above the flowering hedgerow. He was lowering at the group with what she took for an expression of serious disapproval; and when he caught her eye, he gave a mere curt nod and rode on again.

ALBANIAN BLOOD-FEUDS.

SCODRA, the capital of North Albania, in which for the time being my lot is cast, has an evil reputation for blood-feuds and assassinations. Here, as in many other semi-civilised communities, the law is extremely uncertain, and the yataghan and pistol prompt and decisive. And there is no need to go into the mountains for evidence on this point. Between the end of the public garden and the entrance to the Konak is a long lane or passage between two high walls, which shut in houses and gardens on each hand. At the top of this passage are the great gates of two houses; and at the bottom of it sits a mountaineer in Mirdite costume, with a rifle across his knees. For hours together he sits there looking up and down the road, and guarding the entrance to the lane leading to his chief's house. Presently he will be relieved by a man the counterpart of himself, who will take his seat upon the vacated stone; and then the first guard, after stretching himself and exchanging a few words with his relief, will slowly stride up the lane and disappear through one of the great gates at the top. This stone by the side of the road is never without a mountaineer with his rifle across his knees, and his pistol in his *sila*, calmly smoking cigarettes and exchanging nods with passers-by of his acquaintance.

In one of the houses at the end of the lane lives an Agha of Middle Albania, who has fled from his own country on account of a blood-feud with a neighbouring family of greater strength and importance than his own. The chief of the most powerful family in the Agha's district is a young Bey, who has been educated in France, and who, besides the habit of wearing Frankish dress, has brought back from Europe only the vices of his schoolfellows and none of their few virtues. In an altercation on some trifling matter, this young Bey struck the Agha in the face; and, instantly, the relatives and retainers of the two chiefs drew pistol and yataghan upon one another, and a brisk skirmish ensued, in which several men were killed and more wounded. For some time the houses of the two chiefs were in a state of siege, and whenever the rival factions met in the street or in the bazaar, a free fight occurred, to the temporary interruption of business. These constant battles became such a nuisance, and were carried on so ruthlessly, that the Turkish government at last interfered, and succeeded in deporting the Agha and his family to Scodra, where they live more or less as state prisoners, leaving the Bey's family masters of the field.

Nearly every day the Agha quits his walled-in and fortified house and goes for a walk in the afternoon. First marches a retainer with a rifle

on his shoulder, and a perfect arsenal of smaller weapons in his girdle. About five years behind comes the Agha, a tall, lean, well-knit man of fifty, but looking about thirty. His long moustaches are still golden brown, and his sun-burnt clean-shaven face is smooth and without a wrinkle. His head is shaved above the forehead; and on the top his hair is cropped close and covered with a fez, so that no gray hair tells of advancing age. He wears the mountaineer costume of tight trousers and short jacket; but his waistcoat is a blaze of gold embroidery that almost hides the crimson-velvet ground on which it is worked; and his trousers are seamed with heavy stripes of gold lace. He wears jack-boots reaching to just below the knee, and they are triumphs of his bootmaker's art, being worked all over with gold and silver wire in many a fantastic pattern and device. And so he stalks proudly along, glancing about him with eyes like a hawk, his hand resting on the carved silver butt of his pistol. Behind him, at intervals of about a yard, follow his two sons, each one with his right hand grasping a weapon; and bringing up the rear come two more Mirdites with rifles and pistols. They march along at a slow and stately pace in Indian file at the side of the road without exchanging a word except when, at rare intervals, the chief jerks a word over his shoulder at the son following him, and receives a grunt in reply.

In this cheerful fashion they stride along past the public garden through the streets to the Turkish quarter, where perhaps they visit an acquaintance; and then they stalk home again as solemnly as if they were attending their own funerals. Some day they expect to meet a body of their enemies in the street, for they owe blood to the Bey's family; and then a battle will begin as they stand, and unlucky will be the passer-by, European or otherwise, who does not bolt to the nearest place of shelter, for rifles and pistols will ring sharply out, and bullets will whistle up and down the road with little regard for harmless men going about their lawful business. If a company of the Turkish *zaptiehs* join in, under the pretence of separating the combatants, matters will be ten times worse, for these latter will fire their Martini-Peabodies 'promiscuously' at the crowd, and will in all probability draw the fire of both parties upon themselves for interfering in matters which do not concern them. And the people who will suffer most will be the unwilling spectators who have not been able to get under cover in time. Happily, there is little or no chance of such a catastrophe, for Scodra is getting too civilised for faction-fights in the streets, and the Pasha knows better than to let such things occur, when he has four or five consuls in the town at one end of the telegraph wire, and the ambassadors at Constantinople at the other. So the Bey's family is no doubt carefully watched, and any large party of them would be promptly prevented from entering the city; and without a strong body of men, it would be madness to attack our friend the Agha, for he is well guarded, and, moreover, under the protection or surveillance of the government.

But even now isolated affairs of honour are by no means rare, and men who have blood-feuds are frequently shot down in the streets or bazaar.

The month of Ramazan is particularly fruitful in such efforts to obtain justice or revenge. During this month, no good Mussulman may touch food or drink from sunrise to sunset; he may not even drink a single cup of coffee or smoke a solitary cigarette. It can easily be imagined what a painful trial this is when Ramazan occurs in the summer, and how terrible must be this enforced abstinence from food and drink under a broiling July or August sun, when almost every scrap of vegetation is burnt up, when no rain has fallen for months, and the very air seems like the blast from a furnace. The hours between sunset and sunrise are so short in the summer that there is little time for feasting, and the long hours of daylight can with difficulty be whiled away in sleep, even if there is no work to be done in the bazaar or in the city.

And so every now and then groups of hungry and thirsty Mussulmans may be seen standing at their gates watching for the sun to go down and scowling savagely at the 'dogs of Christians' who go cheerfully about puffing their cigarette smoke after a good meal at mid-day, and as much coffee as they can drink all day. It by no means improves their tempers to see well-fed 'infidels' going by while they are watching for the guns from the castle with which sunset is saluted during Ramazan, to tell them that their sixteen-hour fast is over; and so more men are shot down in private quarrels during that month than in any other month of the whole year. Only two or three years ago, fourteen men were shot in Ramazan; but every year the number of these murders grows less, for Scodra is slowly becoming civilised, and the influence of the little European colony getting more powerful. Still, about once a month regularly throughout the year, Simon the cook having bothered me to decide whether muscular fowl or leathery beef will be less distasteful to me for dinner, stands fez in hand, evidently brimming over with news. I feel that I am expected to inquire what the news is, and I do so. 'Has your lordship heard,' he says eagerly, 'that Hassan has shot the son of that Hussein?' Simon always refers to his fellow-countrymen by their first names, prefixing with airy indifference the pronoun 'that.'

'What Hassan?' I remark, for there are probably two or three hundred in the city.

'The son of that Selim who lives near the bazaar.'

Having localised my man, I proceed: 'Why did he shoot Hussein?'

'How should I know? The evil one entered into his head.'

As the occurrence happened so recently, it is difficult to extract more than a bare outline of facts from my cook. To-morrow, when he has had time to discuss the matter fully with his friends over a glass or two of *raki*, he will give me full and marvellous details; but to-day his brain has not had time to grasp more than the simple fact that one man has shot another.

The causes of these unhappy quarrels are frequently very trivial. A dispute over a game of cards or a jostle in the bazaar will suffice to make a man fire upon his friend and shoot him dead. And the matter does not end there. Every member of the murdered man's family is bound in honour to seek out and shoot the murderer

wherever he may find him. If he cannot find the actual homicide, then he must kill the brother, or the son, or some near relative; and having in this manner appeased the spirit of his murdered kinsman, the right of blood passes over to the family of the original murderer, and they in their turn lie in wait for one of their enemy's clan, picking out for choice an only son, or the man whose death will cause the greatest grief and distress to the opposite side. These feuds go on from generation to generation, and the original cause of some of them is lost in antiquity.

In 1857 the Turkish government made a vigorous attempt to put down the vendetta, for over five hundred men of Scodra alone were wandering houseless and homeless among the mountains on account of blood-feuds. Nearly every tribe accepted the truce excepting the Mirdites; but the wild law of a life for a life was never finally stamped out, and never will be until a firm and settled government makes its administration of justice independent of *bukshesh*, and respected by the tribes as without fear or favour. The Roman Catholic priests have done their best to stop it in the mountains, but without avail. A reforming young priest once went so far as to excommunicate a man who had notoriously killed several persons in a blood-feud. The murderer believing himself shut out from heaven, not by his own misdeeds, but by the over-zealous action of the priest, called upon him, and threatened him with instant death if he did not then and there withdraw the sentence of excommunication. The poor priest tried to shuffle out of it, but in vain; the mountaineer was inexorable, and after obtaining his absolution, marched off with the warning that His Reverence had better confine himself for the future to his own province.

A quarrel once arose between two friends because one had promised the other fourteen cartridges, and afterwards refused them, and as a consequence, twelve men lost their lives in one day. A terrible feud between two mountaineer families had its origin in a pig eating the young crops of a neighbour as they were springing up. The owner of the crops shot the pig, and the owner of the pig instantly shot the slayer of his animal; and many years passed and many lives were lost before this blood-feud was appeased and the *bessa* established. But often the causes of a blood-feud are serious enough. Many arise from a young girl having been carried off without her parents' consent, and any insult to a woman is promptly punished with death. An injured husband is bound to avenge the stain on his family and himself by shooting the offender, or ever remain a disgraced and dishonoured man.

The other day I was going along a street in the Turkish quarter when I saw a head and the barrel of a rifle protruding round the corner of a by-street just ahead of me. When I reached the spot I saw a young Mussulman of the town sitting calmly on a large stone, like the Agha's mountaineer, but with a different purpose. In the street I had just come up was the entrance to his enemy's house, and every day for weeks past he has been watching that doorway for several hours a day. When he hears footsteps coming, he peeps round the corner, as he did when I came along; but generally he sits on his stone, whence he can just see the gateway. His

family is at feud with the owner of the house, and the last victim who fell was his brother, shot as he was going to his shop in the bazaar. The avenger of blood is a tall fair youth about twenty-three years of age, and he will wait patiently until his enemy or his enemy's son comes out of those great gates, and then he will avenge his brother. They owe him blood, and so, until he has fired, no one will fire upon him. The inhabitants of the house know that they are watched, and now and then, when the young man is not at his post, the father, or son, slips out, and returns stealthily after *Aksham*; but the servants, women, and cousins move in and out freely all day, for in Albania no man touches a woman, and the distant relatives are comparatively safe as long as the chief offender is unharmed. Some day the young fellow's long vigil will be successful; the enemy will leave the house thinking all safe, and then a rifle bullet will avenge his dead brother's blood. He will wait long and patiently, and until he has attained his object will not raise the siege of the house. Nothing will turn him from his purpose; he would be disgraced for ever if his brother's murder went unavenged; and it is too much to hope that, before he succeeds in shooting his foe, the day of blood-feuds will have passed away from Scodra.

OGILVIE WHITTLECHURCH.

CHAPTER IV.

THE *Maharanee* did win the race, and now lay safely secured alongside the wharf. The crew have gone; and the officers, who are now at breakfast in the cuddy, have only to send in their store accounts and turn the ship over to the owners' agents, before they, too, will be free to go home.

The post has brought Rimington two letters. The one he opens first is in a lady's handwriting:

ROSE COTTAGE, Monday.

DEAR OLD GEORGIE—Why don't you come home? Mother and I go to the station about six times a day. I try to impress on her that you're not worth it; but I know we shall go on doing so until your majesty deigns to honour us with your presence. But your poor sister's spirit is not yet quite crushed, and she doesn't mean to wear out her best pair of shoes for nothing. So be advised in time, sir. Take the first train north, and throw yourself on the mercy of the court. Remember the cold pigs that somebody got last year.—Mr Forward, whom you introduced to us in Scotland, has been here a good deal when he has been on leave. His father is the nicest old gentleman you ever saw. They have been awfully kind to us, and take us out in a little yacht of theirs. We went to Robin Hood's Bay in her last week; it was so jolly! Colonel Forward says that he hopes you will come in her a lot, if you do not have enough of the sea at other times.—The post is just going, so I must make this letter a short one, and say good-bye.—Your affectionate sister,

MARY.

The other letter was from Parkins:

GRAND HOTEL, Monday, Sept. 12.

DEAR RIMINGTON—It seems that we were entirely on the wrong scent. Our Ogilvie Whittle-

church is at present in a solicitor's office. His father and mother are both alive, and J. has no first-cousins. He is going to look me up to-morrow. Come and lunch with us at one o'clock.
—Yours very sincerely,
JOHN PARKINS.
P.S.—Where the right man is remains a mystery.

Rimington had a good deal to do that forenoon, and could not help arriving rather later than the hour which Parkins had named. He found them waiting lunch for him. It was so long since he had seen Whittlechurch, that it required some effort of memory to recall his appearance; but, this made, he fancied that in the young man before him he could still trace some resemblance to the little fellow he had known so long ago at school.

Lunch was served in the dining-room, and afterwards they retired to Parkins' sitting-room for cigars and coffee. During lunch the conversation had been chiefly about Parkins' adventure at Wangtung, and now it again drifted back to the same topic.

'Well,' said Parkins, 'this shall be a warning to me never again to confuse probability with certainty. That there should be another Whittlechurch in the world was only likely; but that there should be another Ogilvie Whittlechurch of about your age, not a relation, I thought impossible.'

'But I have suspected his existence for a long time,' quietly put in the young solicitor.

'You have!' exclaimed at once both Rimington and Parkins.

'Yes. Don't you remember that when I was kicked out of Olswick, old Layton said that he had seen my name cut on one of the apple trees I was supposed to have robbed.'

'But hadn't you been there?' asked Parkins.

'No, I had not; and to this day I remember my indignation when the doctor refused to believe me. The question then arises: how did the name get there? And to this question there are only two possible answers. Either one of the fellows at school owed me a grudge, and carved it; or else some one of the same name had been in that very orchard the same afternoon. A cynic would say that the first answer was the more likely; but I prefer to believe the second.'

'There are blackguards everywhere,' said Rimington. 'But if a fellow did carve your name, and then allowed you to be expelled without saying a word, he must have been a very black sheep indeed. Why, a fellow who could do a thing like that as a youngster, would have murdered a man or robbed a bank before he was twenty. Under ordinary circumstances, however, I should be inclined to accept the first theory. That there should be another fellow of your name, and that that fellow should have been at a certain place at a certain time, is too much to assume. But now the case is altered. We know for a certainty that there is, or, at anyrate, that there was, another Ogilvie Whittlechurch. Is it, then, more likely that this individual was at a certain place at a certain time, or that one of the Olswick fellows was, for his age, one of the most utter sneaks and blackguards that ever stepped?—What do you say, Parkins?'

'I won't venture an opinion; but what I will

do is to write to Pryer the detective, who is employed about this; and it will be for him to decide whether the trace is worth following up.'

After some further conversation, Rimington and Whittlechurch took leave of their host, who promised to write and inform them of anything which happened in the matter.

From the *Grand Hotel* in Northumberland Avenue to Gatti's café at Charing Cross is not five minutes' walk; yet, while Parkins and his friends were still sitting over their coffee at the former establishment, Mr Pedro Bersaño, at the latter, was waiting for Charles Miller, able seaman, who was to meet him there at three o'clock. Thus does chance delight in 'impossible' coincidences. While, however, Parkins, Rimington, and Whittlechurch were quite disinterested parties, actuated solely by a not unnatural desire to follow to its conclusion, and, if possible, facilitate the unravelling of a mystery which had been so remarkably thrust under their notice, Mr Bersaño, on the contrary, had, as we know, a very considerable personal interest in the question. Miller also was bent on business, inasmuch as he had no intention of giving his information for nothing.

Gatti's is something of a compromise between an English refreshment bar and a continental café. In shape it is long and somewhat narrow, its greater dimension being parallel to Villiers Street. Entering at the end nearest to the river, there is a door on the left leading into the restaurant. Then comes the bar, which extends about half the length of the room. On a level with the upper end of the bar there is a sort of semi-partition, which more or less divides the room into two parts. Above this, again, is the door which leads to the ladies' cloak-room on the left. Behind the bar, two liebes are in attendance; and an Italian waiter looks to the wants of those visitors who prefer to patronise the numerous little marble tables which are scattered, in true Neapolitan style, about the apartment.

When Mr Bersaño arrived, it wanted ten minutes to three, and the café was absolutely deserted. He called for a tankard of *lager*, and sat down at a table opposite the bar. He had not long to wait. At about five minutes to three, Miller entered by the upper door, glanced round, and then accosted him: 'Are you Mr Bersaño?'

'I am.—And you, I presume, are Mr Miller?—Come over here.' So saying, he led the way to the farther corner of the room, where they would be out of hearing of any stray customers.

'Now, what is your business?'

'I'm thirsty.'

'Porter?'

'To begin with.'

The porter was brought and paid for, then Bersaño continued: 'You say that you have information of great importance to me. What is it?'

'Tain't nothing to be given away.'

'Indeed! And may I ask the reserve price?'

'A hundred pounds.'

'You are drunk.'

'And yet, I don't speak so extraordinarily stupid. There's others will give me just as much for it.'

'Others will give you just as much, will they? In what way does your information concern me?'

'I wouldn't do you any harm if a certain Ogilvie Whittlechurch was found, by any chance, would it, mister?'

Cool and sharp-witted as he was, Bersaño could not help an involuntary start at this sentence. The man evidently did know something, and he had not come on a fool's errand, after all. Instantly recovering himself, he replied: 'True; it will be slightly to my advantage if they fail to find him.'

'It would make you a millionaire?'

'Well, not quite; but I have yet to learn in what way you can be of service to me in the matter. So far you have told me nothing that I did not know already.'

For reply, the other tapped his tankard.

'More porter?'

'Rum.—Ah! that's more warmin'. 'Ere's at yer, mister.'

'Well?'

'I can give yer the whereabouts of this chap for a hundred quid; and if yer don't like that—well, I'll give 'im the straight tip about the will.'

'I conclude, however, that he knows his own name, and will be fast enough to answer when they advertise for him.'

'Young men don't read the papers—leastways, not carefully—and there ain't nobody but an old bloke to point it out. You see, 'e don't call 'imself Ogilvie Whittlechurch.'

'Well, I accept your terms. When I have your information, I will give you a hundred pound.'

'Yes?—I don't think. We'll put it t'other way, please. You shell out the shiners—then I'll spin the yarn.'

'As you will. But I don't carry the Bank of England about with me, so you must come to my rooms.'

Both men were now in earnest conversation as they were safely in one of B. Neapolitan's, produced without further haggling. When Bersaño, from which he took fifty sovereigns and five ten-pound Bank of England notes, and handed them to Miller.

The latter then proceeded to give his information, which he did faithfully and fully and without omitting a single detail; and explained also how the story of the will, and Bersaño's address, had come to his ears.

The other had grasped the situation before he had half finished, and was busy maturing a scheme of action while he listened. A shrewd unscrupulous cosmopolitan, familiar with the ways and customs of every state in Europe and America, he knew that England was the worst, from his point of view, in which this could have happened. In France, Germany, or the United States of America, his course would have been simple. He would have introduced himself to Forward under an assumed name, picked a quarrel with him, and shot him. In other parts of America, a hundred dollars would have paid for a few inches of steel, which would have done the business with even less trouble. But in England—in England, one must be discreet in these little matters. However, something must be done.

When Miller had finished, he was rising to go.

'Stay,' said the other, looking at him fixedly. 'You have been of great service to me, but you can be of greater service still.'

'Ow's that?'

'You say that he lives at Whitby?'

'Yes.'

'The cliffs are high on that coast?'

'Yes.'

'And overhanging?'

'In some places.—Why?'

'Merely curiosity. But you must be thirsty. I have some excellent brandy in the cupboard here; will you try a glass?'

Miller nodded.

'Water?'

'No.'

'I see you appreciate it.—Have another?' And without waiting for a reply, he refilled the glass. Then he continued: 'Let's see what was it we were talking about!—Oh yes, the cliffs at Whitby—I wonder if people often fall over them?—I wish this fellow would; but of course he won't. I would give a thousand pounds to know that he had done so.'

Their eyes met.

'Make it two.'

'I will draw you a cheque for fifteen hundred, dated ten days hence. If the account of a certain dreadful accident does not appear in the papers before that date, it will be stopped.'

'And if 'e ain't at Whitby?'

'Well, then, he might possibly fall over a cliff somewhere else, or even into a canal—life is so uncertain.'

Two days after this interview, George Rimmington was able to leave London for the North, and arrived at Whitby station at about nine o'clock in the evening. It was rather more than two miles to Rose Cottage; but, feeling rather stiff and cramped after his journey, he chose to walk, notwithstanding that the night was stormy and threatened rain. In view of the latter, he took the precaution to put on a big Flushing overcoat, which was strapped up with his rug. It was a good thick coat, an old friend, which had stood him in good stead on many a cold night-watch, and was fitted with an enormous hood, that rendered its wearer completely secure from the fury of the elements. He took a handbag with him, and left directions for the rest of his luggage to be forwarded in the morning.

It was indeed a terrible night; and the weather was rapidly becoming worse. The wind blew in sudden gusts over the cliffs from seaward, while at the foot of them the angry waves broke with a deafening roar, which promised but little mercy to any ship which, through bad seamanship, or unfortunate circumstances, should be wrecked that night upon the coast. Happily, the quiet which reigned both at the lifeboat shed and the rocket-apparatus house was a sign that, as yet at any rate, no vessel had fallen a prey to the tempest.

His thoughts as he walked turned naturally to the home he was approaching, and to his mother and Mary. Who but a sailor can appreciate that word home in its true sense? In all his wanderings, in all his hardships, the thought of it is there, shining ahead like a guiding star, a beacon

of hope. Coming up Channel on a dirty night, the wind cutting him like a knife, the snow blinding him, and with every chance of a collision at any moment, he remembers that he is only a few hours off England, and the thought cheers him up. Rimington knew that they were not expecting him till the next morning, and he amused himself by thinking of their surprise when he turned up. He pictured to himself his mother, sitting in her armchair by the fire, with Mary on the rug at her feet, working or reading aloud. Then would come his knock at the door, and they would wonder who it could be at that time of night. But their wonder would not be for long. Mary would have guessed that it must be him, and be peeping from the top of the stairs when the maid let him in. Then what a kissing and hugging and asking of questions! How he would enjoy his supper that evening, and his pipe after it, sitting with his mother and sister by the fire. He was now nearly there; and just as he arrived at the little iron gate leading into the garden, he was rather surprised to hear, during a temporary lull, the sounds of a piano, and—yes, there was no doubt about it—a man's voice singing to its accompaniment. Who on earth could it be? He remained listening for a few seconds with the gate open, and was just going to reclose it after him, when, as he turned to do so, his attention was drawn to the figure of a man standing a little way off in the path along which he had just come. There would have been nothing very strange in this, but that he had happened to notice on his way that he was the only individual on the cliff.

'Some one who has walked across the common, I suppose,' he thought, 'to see whether there is a wreck, and get a blow through.'

Just then, however, to his intense astonishment, he saw the man deliberately lie down on the ground. 'By Jove!' he thought, 'the fellow's in liquor. I can't leave him there, or he'll either die where he lies before morning, or else wake up and fall over the cliff.' So, hastily reclosing the gate, he started forth, like a good Samaritan, to rescue the unfortunate wight from his perilous position.

ANOTHER MARVEL IN GUNNERY.

THE country which has surprised the Old World with so many startling novelties and inventions—amongst others, the Pneumatic Dynamite Gun of Lieutenant Zalinski—has just sent us another wonder in the form of a shell filled with dynamite, which may be fired from any ordinary breech-loading gun. The inventor of this marvel in projectiles is Lieutenant James W. Graydon, late of the United States navy, who, being well aware of the drawbacks involved in the use of dynamite or other high explosives for bursting charges of shells, turned his attention towards overcoming them. These disadvantages are the sensitiveness of such compounds to heat and concussion, and the liability of the nitro-glycerine in the dynamite to separate from the carrier with which it is associated in manufacture. Knowing these drawbacks, Lieutenant Zalinski designed his Dynamite Gun, previously explained to our readers (5th March 1887), and in which air-pressure is used

for the propulsion of the projectiles. Lieutenant Graydon improved upon the Zalinski Gun; but neither his arm nor that of his competitor met the requirements of the case. Their guns are admirable for use on board ships or in land defences; but, owing to their cumbersomeness, they could never be used in the field or in siege operations. To adapt dynamite shells for firing from ordinary guns, which can at present only be done with gunpowder, has been the aim of Lieutenant Graydon, and in this he has succeeded not merely in theory but in practice. The success which has attended the solution of this difficult problem is, alas! another illustration of how the inventive genius of man can be turned to sinister purposes; but as the advocates of scientific warfare argue that the very destructiveness which will ensue in future wars will render them impossible, or, at anyrate, will make them less frequent, the gain to humanity at large will be all the greater.

To return, however, to the Graydon Shell. Two objections are raised to the use of gunpowder in firing dynamite shells. In the first place, the blow exerted on the base of a shell by the explosion of a charge of gunpowder in the bore of a gun would inevitably fire an unprotected sensitive explosive. In the second place, the bursting charge of dynamite would be ignited by the heat generated by the friction of the shell in its rapid passage through the bore. In either case, premature explosion in the bore would be the result, which would mean destruction of the gun and the gun's crew. Now, to prevent either of these eventualities occurring, Lieutenant Graydon lines the inside of the shell with asbestos cloth, which is an excellent non-conductor of heat, and which isolates the dynamite from the metal, and prevents the transmission of heat from the latter to the former. He next divides the dynamite into pellets or cartridges not exceeding in bulk half a cubic inch, each pellet being besides enveloped in paraffined or varnished paper. This envelope prevents the exudation of the nitro-glycerine or other active agent in the explosive from the absorbent with which it is associated, and its concentration in some part of the charge, when it would assume the very sensitive and dangerous state common to nitro-glycerine when not combined with an absorbent substance. The envelopes of the pellets also cushion the charge, and serve to prevent the shock of the explosion of the firing-charge being transmitted to the dynamite in the shell in such a manner as to cause premature explosion. The blow from an explosion of gunpowder upon the base of a shell, by the way, may be as high as forty-seven thousand pounds' instantaneous pressure per square inch. Lieutenant Graydon further subdivides and isolates the dynamite in large shells by the use of partitions in the projectiles. These partitions prevent relative motion between the pellets of dynamite, and minimise friction among themselves, caused by the rapid rotation of the shell, to the lowest possible degree, if not altogether.

Dynamite shells thus constructed may be safely fired from ordinary guns by the usual time or contact fuses. When it is desirable, however, to obtain high penetrative power in the case of firing against armour-plates or masonry fortifications, a slow-acting contact fuse should be used. Lieu-

tenant Graydon has devised an ingenious arrangement for the purpose, which consists of a spiral spring holding back the contact piece or striker. On the shell striking the object at which it is aimed, the spring becomes extended, and at the moment of the forward motion of the shell ceasing, it flies back and actuates the striker, when the charge is exploded. The shell, owing to the momentary retardation of the action of the fuse, is permitted to bury itself in the armour-plate or masonry, and the full bursting effect of the shell-charge is utilised at the moment when the projectile has reached a point at which it can do most damage to the structure. It was stated before that all this is not mere theory. As a matter of fact, the shell of Lieutenant Graydon has been repeatedly practically tested, three series of experiments having been made in the presence of officers of the United States army, of which there is a full record.

The first trials were made in August 1886, when several rounds were successfully fired from a three-inch field-gun at the Presidio, San Francisco. A few days later, a second series of experiments was carried out, fifty-two dynamite shells being fired from a four-and-a-half-inch siege-gun at Fort Winfield Scott, with equally destructive effect. The American artillery officers present reported so favourably to the United States War Office that further experiments were ordered. In December 1887, consequently, trials on a large scale were made at Sandy Hook, attended by members of the United States Ordnance Board, a one-hundred-and-twenty-two-pound projectile containing two and three-quarter pounds of dynamite being fired with a twenty-three-pound powder-charge from a seven-inch rifled gun. The target represented part of an iron turret the sides of which were fourteen inches thick. Two rounds wrecked the target, whilst a third round utterly demolished it. This was considered so satisfactory that a further series of tests, which are to demonstrate the utmost capabilities of the Graydon shell, have been arranged for. It is also stated that experiments are shortly to be made in this country, Lieutenant Graydon having succeeded in interesting the War Office authorities in his invention.

THE REALITIES OF YACHT-RACING.

BY "A LANDSMAN."

It had always been my ambition to take part in a yacht-race. I had often felt my heart bound with excitement and enthusiasm at the sight of a snowy-winged fleet flying before the breeze amid showers of glistening spray; and although I had never been on board a vessel of any kind except a Thames steamer and the *Calais-Douvres*, I was convinced that the deck of a smart yacht was the sphere whereon I should excel if I could only get an opportunity. I had an opportunity this summer, and I have changed my mind.

I don't know whether some remarks I let fall to my old friend Macstane, when he was spending a few days with us at Tooting, prompted the invitation or not; but my delight literally knew no bounds when he wrote asking me to join the yachting party on the Clyde to witness the

regatta, in which his cutter the *Rosebud* was to make her first appearance as a racer. Of course I accepted the invitation. I positively jumped at it; and in spite of a good deal of covert sarcasm on the part of Mrs Jones, I decided to make my debut as a yachtsman in proper style—blue serge coat, straw hat, and canvas shoes, as one sees the fellows got up on the pier at Dover.

'It's very absurd to go to such unnecessary expense,' said my wife, when I presented myself habited in nautical garb for her inspection the evening before I left home. 'It's simply ridiculous. A map of your figure too. I am really surprised at you.'

I didn't think that Mrs Jones's reference to my size was in the best possible taste, but I passed it over. Between ourselves, I think she was annoyed at our friend's omission to include her in his invitation; but he always said that ladies were in the way on board a yacht during a race; and of course I agreed with him.

'I am sorry that Macstane didn't ask you, too, my dear,' I said, blandly ignoring her remark; 'but perhaps you would not have enjoyed the trip.'

She had been studying my costume with a critical eye, and took up her needlework again, giving me a final dig as she transferred her attention to it. 'No; I don't care about the sea,' she said. 'I do hope you won't be sick.'

Sick! The idea of *mal-de-mer* as a possible result of bearing a hand on board a racing yacht had never crossed my mind, it was so incongruous. To be sure, I had suffered agonies crossing the Channel, but that was a different thing altogether; everybody allows that passage to be the most trying known to travellers. But on board a ten-ton cutter in the Clyde! I laughed pleasantly at Mrs Jones's forebodings, and said that I feared she did not know much about yachting.

'I daresay you will know more in a day or two, Algernon,' she said dryly. 'All that glitters isn't gold, you know.'

Mrs Jones has a somewhat irritating habit of combining prophecy and proverb; but justice compels me to admit that she is very often right. I was foolish enough to tell her the details of a day's fishing I had with Bilston up in Yorkshire once, and she has never ceased reminding me how she warned me not to go. My troubles on that occasion have furnished her with texts for many a lecture, and now she seems to take a placid satisfaction in contemplating the discomforts which may attend my present expedition. It is not reassuring; and I go up-stairs to change my clothes, harassed by unsailor-like doubts as to the unqualified pleasures of the prospective cruise.

Two days later I am standing on the *Rosebud's* deck, enjoying the magnificent scenery of the Clyde at Wemyss Bay. It is a lovely morning, and there is enough wind to send the yacht quietly through the waves without making her lean over too much. Macstane, a very pleasant young fellow called Baynes, a weather-beaten old tar answering to the name of Sandy, and my humble self, compose the crew. I have helped them as much as I can in getting up the sails; but the numbers of ropes are so awfully confusing, that I contented myself with pulling, and

hauling just when I was told, so as to avoid getting into scrapes.

'We must get out the spinnaker, Sandy,' says Macstane, who is steering, to the ancient mariner. 'Will you fellows give him a hand?' he adds addressing Baynes and me.

Of course I am delighted to assist, and should be even more so if I had the faintest notion what a spinnaker is. It's a sail of some kind, no doubt; but where it is to go I confess I am quite unable to see; however, I follow Baynes forward, and wait in readiness to act upon orders.

'Can you swim, Mr Jones?' says, Baynes in a half-whisper, as I help him to let down a thing he calls the 'boom.'

'Not very well,' I reply, a little anxiously.—'Why?'

Mr Baynes glances at Macstane to see that he isn't listening, and says very gravely: 'Macstane oughtn't to have brought you if you're not a good swimmer; he'll cram on every inch of canvas, irrespective of the boat's ability to bear it, if he takes it into his head. He's a perfectly reckless man himself, you know.'

This is rather disquieting; the breeze is freshening already; and when we have succeeded in setting the spinnaker, the yacht heels over in a manner which is very alarming. I begin to wish that I hadn't come; but Macstane is smoking his pipe so coolly that I don't like to do more than hint at the very unnecessary danger we are incurring.

'Do you think she can carry so much quite safely?' I ask with assumed carelessness.

'Carry it! My dear fellow, you don't know what the *Rosebud* can do if she tries. I've got a lovely flying jib to set next—a thundering big one. Wait till we get that up.'

Baynes, who is standing behind him, gives a perceptible start, and looks at me with an expression of undisguised horror. Really, I didn't think Macstane would have been guilty of such foolhardiness, and I feel myself turning pale.

'Beginning to feel queer?' asks Baynes, looking at me as he lights a huge cigar and sits down at my side. 'We shall find it a good deal livelier down at Largs.'

I do not quite understand Mr Baynes. I feel perfectly well, and he ought to know that my change of colour is the echo of his own natural apprehensions. I suspect that he dreads giving offence to Macstane, who is very touchy, and the most obstinate man on earth. Perhaps it will be wisest for me to take my cue from him and say nothing about the sails; but I confess that I don't like the prospect before us at all.

We are tearing along through the water at an extraordinary pace, and if I could only be sure that Baynes's fears are unfounded, my highest ideal of yachting would be realised; but I cannot forget that we are in momentary peril of our lives. Presently, we sweep smoothly round a headland, and a sight bursts upon my view which reawakens my old enthusiasm. We are entering Largs Bay; the blue stretch of water is swarming with white-sailed yachts of every size, from the pyramids of canvas, which Baynes tells me are sixty tonners, to boats smaller than the *Rosebud*. They are dashing and flitting in all directions, wheeling round with the graceful ease of seabirds, threading their way amid the fleet

like things of life. The strains of the band on board the flag-dressed steam-yacht which belongs to the Commodore add to my rising excitement. It is glorious; and if the wind would moderate a little, I would light a cigarette; but as Baynes foretold, it is 'livelier' here than at Wemyss Bay; and before long I begin to remember that last trip I made across the Channel.

Macstane gives Baynes charge of the tiller and hails a rowing-boat. He says he must go and pay his respects to the Commodore, and invites me to go with him. I should like to be presented to the great man, who seems to be a kind of yachting Admiral; but the boat is pitching so frightfully that I wouldn't attempt to get into it from the *Rosebud's* deck for any consideration; so Macstane swings himself over the side and goes alone. I wish Mr Baynes's tobacco was not so dreadfully strong; if he were not almost a stranger, I should ask him to stop smoking, for I'm certain it's the smell which is causing my otherwise unaccountable disinclination to move. The breeze, which is very unsteady, drops to the lightest breath by-and-by; and as soon as the yacht is on a decently even keel, I pull myself together and go forward to escape the smoke and have a chat with Sandy, who looks a very intelligent person.

'How long do you think it will take us to go round the course to-day, Sandy?' I ask with the air of a pupil addressing a professor.

'That,' says the ancient mariner thoughtfully, 'will depend on the wind.'

I ought to have known that, of course; but Sandy gives the information in a tone which implies that he doesn't expect much common-sense from me; and I do not feel flattered.

'I suppose you know most of the yachts on the Clyde, Sandy?' I say presently with great respect.

'On a par with a'.

'Do you think, then, that the *Rosebud* has a chance of winning?'

Sandy gives me a look which says as plainly as speech, 'I never answer riddles,' as he replies: 'That will depend on what other boats are gunn.'

I feel thoroughly snubbed this time. I have heard a great deal about Scotch caution, and perhaps I ought not to have expected him to commit himself to an opinion; but I do think he might be a trifle less patronising in his manner. I make one more attempt to abstract information from him on a point which is fraught with anxious interest to me. 'Do you think,' I say very confidentially, 'that the yacht is at all likely to capsize with the amount of canvas she is carrying?'

Sandy glances upwards carelessly. 'She might,' he says, 'if it were blowing hard enough.'

I will not try to get anything more out of Sandy; he appears to be a very hard, unsympathetic person.

We have been gliding peacefully about the bay, waiting for Macstane, who turns in half an hour and clambers on board in a state of raving frenzy. 'Such folly!' he exclaims, 'he resurfaces charge of the tiller and gesticulates with his right hand.' 'We're to race in cruising trim! Spinnakers not allowed! Not even flying jibs!'

Macstane's feelings have evidently overcome

him: he began in a voice of thunder, and he speaks of the forbidden jibs in a wail of sorrow.

'I am so sorry to disappoint you, old man,' he says to me affectionately.

'Oh, don't mind it on my account,' I reply with great sincerity. 'I am not in the least disappointed, really.'

Macstane looks as if he didn't believe me, whereas, in fact, I am yearning to embrace the Commodore, or whoever is responsible for the prohibition of spinnakers and flying jibs. It has taken an immense weight off my mind; but Baynes's well-feigned expressions of regret warn me not to be too profuse in my assurances of contentment with the condition of affairs.

'What time does our race start?' I ask, when Macstane's growlings are beginning to subside.

'Half-past eleven,' he answers with a deep sigh.

'It's ten minutes after the hour now,' I say, looking at my watch. 'Perhaps we—that is, don't you think we ought to begin and take down the spinnaker?—It's an awful pity,' I add with a tremendous effort.

'Take it in,' replies Macstane with gloomy resignation. I wish I could feel a little sorry for him, he does look so dejected; I can't manage that, but go forward with Baynes, trying to appear as sorrowful as he does, and help Sandy to stow away the sail and trice up the boom.

There are seven other yachts in our race; and in spite of the crowding round what Sandy calls the 'boo-ey,' the *Rosebud* gets the best of the start, and passes the line (whatever that is) just as the gun is fired. The breeze has freshened considerably, and Macstane brightens up, whilst my spirits sink in proportion. I do hope I shan't be ill—it would look so foolish. By and-by the wind drops again, and the boats lie idly in a clump, with flapping sails, whilst the owners shout greetings and chaff to each other. There appears to be a great lack of earnestness about yacht-racing. Our mainsail has been slackened out as far as it will go, and the boom waggles heavily over the water. Sandy and Baynes are lying flat on their backs enjoying the sunshine, and Macstane is nodding at the helm. 'It's a drifting-match,' he says sadly, 'a wretched drifting-match.' (Macstane seems very hard to please.)

'I wish I could be of some use,' I say eagerly. I really mean it, for this kind of thing is not my idea of racing at all.

Macstane looks at the mainsail and then at me. 'You might sit on the boom,' he says at last.

I don't quite see what good I shall do by sitting on the boom, but I assent cheerfully, and take up my position under his directions. 'I'd like you to sit out,' he says, 'as far out as you can go, with your feet against the gunle—it will hold the spar so much steadier.—Can't you get out a little farther?—Thanks; that's capital.'

If Macstane was given to practical joking, I should think that he was taking advantage of me. I am sitting girrily on the round polished boom, with my toes against the edge of the yacht's gunwale. I am desperately uncomfortable; the slightest slip of hand or foot will result in my plunging plump into the oily swell below. It isn't of Macstane to have asked me to do this; I swear I won't attempt to get out an inch if he offers me a thousand pounds. I wonder how long he means to keep me here?

'Your weight is the thing,' he says with great cordiality. 'Baynes or Sandy would have been no use, they are so light. It's a pity your legs aren't a little longer; you could get out so much farther.'

For the first time in my life I thank my stars for a very short pair of legs; but I do not altogether appreciate Macstane's criticism of my personality. He speaks as though I had been designed and sent to Scotland for no other purpose than to sit on the boom of the *Rosebud*. I can't take my eyes off the heaving water underneath, and a cold perspiration breaks out on my brow as I feel how dreadfully slippery the spar is.

'Does this do any good?' I ask Macstane after five minutes' silent agony.

'Not much,' he replies with brutal indifference. 'It's as nearly a dead calm as it can be; but you are as much use there as you could be anywhere else.'

It will be a very long time before I form one of a crew to man the *Rosebud* or any other vessel of the kind. I would not have believed that Macstane was such a callous ruffian.

'I think we might have lunch now,' he says after a long pause; 'there's not a sign of wind in the heavens.—Come along down to the cabin.'

We leave Baynes and Sandy in charge, and Macstane scrambles down the perpendicular ladder into what he calls his 'stateroom.' It is an age since I have essayed climbing a ladder, and the hatchway is barely wide enough to let me through; half-way I stick hard and fast, and, to make matters worse, my feet slip off the rungs. I cannot help giving a cry of dismay, which attracts attention to my attitude above and below.

'Shall I give you a shove down?' asks Baynes anxiously.

'Shall I give you a pull by the legs?' asks Macstane's muffled voice below.

'No, no, no,' I cry, struggling breathlessly to regain a footing on the ladder. 'I'm all right now.'

My last glimpse of the upper world shows me Sandy and Baynes grinning all down their backs; and I alight on the cabin floor in a heap, to find Macstane chuckling over me with a violence which threatens apoplexy. There are phases of yachting-life which are wholly devoid of romance.

'Hurt?' asks Macstane, trying to compose his features.

'Not at all,' I reply, rubbing my shoulder and trying to dissemble my feelings.—'I'm quite ready for my lunch, though.'

'There's one good thing about a calm, and only one,' says my host as we sit down—'we can lunch comfortably.'

To my mind, a calm possesses but one drawback, and that is the necessity for some one to sit on the boom; but I don't tell Macstane this opinion.

In spite of the threatening qualms which rendered me miserable an hour or two ago, I make an excellent meal off cold beef, cold apple tart, and bread and cheese. Under Macstane's advice, I take plenty of strong whisky-and-water. Just as it is the best cure, it's the best preventive of sea-sickness, he says, with the confidence of a man who knows; and as I have never heard anything to the contrary, I act upon his recommendation. It is very cool and pleasant down here in the

cabin; and if it wasn't such an undertaking to get through the hatchway, I should like to stay below. But I must get on deck sooner or later, and I'm perfectly certain that the least motion of the yacht would render quite impossible a feat I can only perform with difficulty in a dead calm.

'Going on deck?' asks Macstane as he sees me bracing myself up for the task. 'By all means, if you prefer it; then Baynes can come down to lunch.'

I squeeze myself through the hatchway with a mighty effort, and relieve Baynes, who is dozing over the tiller. He disappears below, leaving me in sole charge of the boat, for Sandy is snoring noisily on the deck forward. I won't awaken him unless I see some signs of wind and his services are required, for his manner when I spoke to him this morning did not impress me at all favourably. I cast a shuddering glance at the boom, which hangs over the water jerking lazily at the tackle; I would almost prefer a gale of wind for the rest of the day to another hour's duty sitting upon it. I had no idea one would meet with such disagreeables yacht-racing.

There are half a score of yachts lying becalmed all round the *Rosebud*; one much too close to be pleasant, in case a breeze should spring up; but I suppose it can't be avoided in weather like this. I am yawning frightfully. What a sleepy day it is. There is something very soothing in the gentle cradle-like rocking caused by the swell; and the hum of voices below only adds to my drowsiness. Every one I can see on board the other yachts appears to be taking a siesta. It looks shamefully negligent.

I don't know how it happened, but next time I raise my eyes I see that the *Rosebud's* bowsprit is trying to force its way through the mainsail of the boat nearest her, and the crew are bawling in stentorian tones at me. Sandy wakes up and springs wildly to his feet shouting: 'Pit down the hellum, pit down the hellum!'

Of course I take my hand off the tiller as though the brass binding had become suddenly red-hot. It does not appear to be a wise proceeding at such a juncture, but Sandy ought to know best, and I obey him promptly. Ah! I thought he was making some mistake; the instant I let go my hold of the tiller, he rushes aft and seizes it himself, telling me very rudely to 'let be.' After a great deal of rushing to and fro and much unnecessary noise, which draws the attention of the whole fleet upon us, our bowsprit is got clear, and the two yachts lie side by side, as if they couldn't make up their minds to separate again. A stout man who has been bellowing orders to the men on the other boat now turns to me and stretches out his hand. 'I claim a foul, sir! A more unseaman-like bungle I never saw. I'll trouble you for your name.' He says this very angrily and rudely, and I am debating in my own mind whether to apologise and take no further notice of him, or to call up Macstane, when he begins once more: 'What's your name, sir? I claim a foul, I tell you—a foul!'

'I'm not quite sure that I apprehend your meaning,' I said; 'but my name is Jones.' I spoke very civilly indeed, conscious that I was to blame for the accident; but he flies into a passion almost before the words are out of my mouth.

'Don't play the fool with me, sir! I am Mr Mactavish of Drumblewhin. Will you give up your name, sir?'

I always make a point of being courteous to strangers, but this person's manner is really very offensive. I draw myself up and answer with dignified hauteur: 'My name, sir, is Algernon Selgewick Jones, of No. 93 Cranwood Terrace, Tooting.' I fold my arms and look very hard at him as I say this; but he doesn't seem to be pacified at all, and is beginning again, when another gentleman, who has been sitting with his back to me, stops Mr Mactavish, and, turning round far enough to see me with one eye, says languidly: 'What is your cutter's name, sir?'

'The *Rosebud*. She belongs to my friend, Mr Macstane of Glasgow.'

'Very good, sir. You have fouled the *Dido* most clumsily, and Mr Mactavish will claim the penalty.'

He adds something in an undertone which I do not quite hear, but it seems to amuse Sandy immensely. I cast a withering glance upon him, and go to the skylight to summon the others. They are both sound asleep (really, yachting-men are singularly lazy), and Macstane doesn't seem much pleased at being disturbed.

'What's happened?' he says. 'Breeze coming?'

'No,' I reply, feeling very much ashamed of myself. 'We fouled another yacht, the *Dido*.'

'Fouled the *Dido*!' exclaims my host.

'Fouled the *Dido*!' echoes Baynes, ruled or eyes.

'Yes,' I reply. 'I am so deeply vexed; by'

Macstane rolls off his seat, and in half a minute appears at the hatchway. 'I would rather have had fouled any boat in the race—all the better set the race—rather than the *Dido*,' he says, set a strained calmness. 'She belongs to The' Mactavish of Drumblewhin.'

'So I was given to understand,' I answer scotfully, glancing at the *Dido*, whose deck is now desert except by two sailors.

'Is he on board himself?' asks Macstane, trying round upon me so sharply that I jump backwards and nearly fall overboard.

'He's aboard,' says Sandy, answering for me with a nod of profound meaning.

'If Mactavish is on board,' says Macstane solemnly to Baynes, 'every yachtsman on the Clyde will know to-night that the very first tin the *Rosebud* started in a race she was handled by a—by a' (he looks at me and hesitates) 'by a man who doesn't know port from starboard; and they will say I did it.'

'I told Mr Mactavish my name,' I say eagerly.

Macstane waves me aside with a groan, and sits down with his hands in his pockets, kicking his heels in the cockpit.

'Mactavish will claim the foul as a matter of course; and it will be reported in the *Scotsman* and the *Glasgow Herald*, and all the papers,' he continues, trying to fathom the deep disgrace I have brought upon him as a yachtsman.

I can't think of anything to say to comfort him. I am very, very sorry for the mishap; but I think he takes it to heart rather too much. He sits in moody silence for a quarter of an hour until the surface of the water is rippled by the breath of wind which makes the sails flap heavily.

'It's no good now,' he says in a hollow voice to no one in particular.

Nothing but my intense desire to make atonement would move me to make the offer, and I do it, forgetting that Macstane has no conception of the martyrdom it is to me.

'Would you like me to go and sit on the boom again?' I ask humbly.

He shakes his head. 'No; thanks, old fellow. We are disqualified by that foul, and couldn't win now anyway.'

Disqualified! Can't win now at all! And I am solely to blame for it. I will never, never place foot on the deck of a yacht again.

VEGETABLE BUTTER.

BUTTER is the name given, in a chemical sense, to all oleaginous substances which remain solid at a temperature of seventy-one to eighty-six degrees Fahrenheit. For popular purposes it is a misnomer, as all the fatty matters included in the term could hardly be used by modern housewives even for culinary purposes. The plants yielding the butter, although not confined to one country, nor even to one natural order, are nevertheless more abundant in West Africa and India than in other parts of the world, and are mostly members of the order Sapotaceæ. The *Bassia Parkii*, a plant indigenous to West Africa, and which derives its specific name from the renowned African traveller, Leo Park, is particularly rich in the product, a source of great utility and profit to the people of the country. The fruit itself when ripe is eaten by them, and is highly valued by travellers who have tasted it to be and pleasant. It is about the size of a large prune, green when first gathered, but otherwise of an excellent flavour. The butter is obtained from the seeds. The manner in which the fruit is collected and treated. The crop commences at the end of May and finishes during the last days of winter. The women and children go each day into the forests, especially after storms and tornadoes, and fetch large baskets or calabashes to the village filled with fruit which the wind has blown down. They throw them into cylindrical vessels, that are found here and there in the Bambara villages even in the middle of the road. Whilst in these holes the fruits lose their flesh, which rots off—they are left there during several months, sometimes for the whole of the winter. The nuts are then placed in a kind of vertical oven, a fire is kept up under them, and this causes them to lose their moisture. As soon as they are dried, the shells are broken, and the white kernel is peeled, and then ground and made into a homogeneous mass. This is then placed in water which is kept boiling. The fatty matter floats to the top, and the dirt goes to the bottom. The butter is then put into a jar filled with cold water and beaten clear. Whilst in this jar it absorbs a certain amount of water, and to get rid of this it is taken out and beaten again. By this primitive process only about ten to twelve per cent. of the butter can be saved.

What the natives would do without it, it is hard to conceive. It practically serves them as food, medicine, and raiment (in the sense that they oil their skins with it). They eat it in the same way as we do ordinary butter, and mixed with an equal part of fat it is considered a panacea against all diseases. It is also employed for lighting lamps, and the smoke which is produced by its

combustion is said to be very efficacious in the cure of snake-bites. It is also largely used for soap-making; for this latter purpose it has more than once been introduced to European manufacturers, but up to the present has never been utilised on an extensive scale. No doubt, as the resources of the country are further developed, and inter-communication between the inland and the coast becomes more facilitated, we shall find this as well as other products equally valuable make their way to this market.

The Indian representative of the family, the *Bassia latifolia*, is very abundant in all parts of India, and the butter expressed from the seed is used in much the same way by the native Indians as that of the *Bassia Parkii* is by the West Africans, whilst the fruit in many parts forms a staple article of food. Every part of the tree, in fact, is of use; the timber being hard and strong, close, and even grained, is used for the wheels of carriages, railway sleepers, &c. The flowers when dried have somewhat the odour and appearance of sultana raisins. They are produced in enormous quantities in March and April, after the old leaves have fallen; and before the new leaves have appeared, the crop rarely fails. The fleshy flowers fall off and cover the ground beneath the trees, and are gathered eagerly by the natives every morning during the flowering season. A single tree yields from two to four hundred pounds-weight of flowers. They are very rich in sugar, and yield when fermented a large quantity of spirit, as much as 6'16 gallons of proof spirit per hundredweight having been obtained from them. The spirit is manufactured to a great extent in India, and it is said that the government receive quite a large amount for duty on the spirits distilled.

The flowers have from time to time been placed before important distillers in England; but owing to a peculiar flavour being developed—caused, it is thought, by the persistent stemens, which it is difficult to remove from the flowers—the spirit distilled has never been brought into consumption in the British market.

NATURE'S REFRAIN.

A SONG OF MAY.

WHAT is the merle reciting
'Mid the leaves of the rowan-tree,
When the shadows rise from the valley,
And the sun leaps out of the sea?
And what is the skylark trilling,
As he soars in a rosy mist,
When the hill-cap awakes from dreaming,
And by Morning is crowned and kiss'd?

What do the waters murmur,
As they throb to the touch of Day?
And what do the young leaves whisper?
And what do the soft winds say?
The Song of songs they are singing,
Wherein our spirits have part:
Listen, Belov'd! all Nature
Doth echo, 'Sweet heart! Sweet heart!'

THE SCENERY OF THE 'BRIDE OF LAMMERMOOR.'

It has been justly remarked by Lord Macaulay that the misfortunes of Viscount Stair's family 'have furnished poets and novelists with the materials for the darkest and most heartrending tales.' Pre-eminent amongst these is the story of his daughter, Janet Dalrymple, the prototype of Sir Walter Scott's 'Bride of Lammermoor,' who stabbed her bridegroom on their wedding night and died a few days after. Sir Walter is careful to disclaim any intention of tracing the portrait of the first Viscount Stair—one of the first statesmen and lawyers of his age—in the tricky and mean-spirited Sir William Ashton; but he virtually admits the close resemblance between Lady Ashton, the ambitious, hard-hearted, and vindictive mother of the bride, to the wife of the Viscount, Margaret Ross of Balnial, a woman of great ability, but of a violent and domineering temper, who brought him a considerable estate, though she did not contribute much to his domestic happiness. She was popularly nicknamed 'The Witch of Endor;' and was so successful in what she undertook, that she was commonly believed, in that superstitious age, to owe her success to magical arts. It was she who forced her daughter to give her hand to Dunbar of Baldoon, though she knew the girl detested him, and had already plighted her faith to another suitor to whom she was strongly attached.
